[Printed in the United States of America]

# FOREWORD MARKAS CONV

The preceding volume in this series of Year Books reported the feverish activities resulting from a sudden envelopment of the entire world within a cloud of war through which, for a time, few bright spots appeared. In this record of the year 1943, although the cloud still covers the earth, the activities, none the less unremitting, are seen to have become more effectively organized and the bright spots somewhat more numerous. The giant of peacetime industry, commerce, science, and art, suddenly paralyzed and diverted from its normal course, has taken stock of its abilities, has re-oriented itself, has developed unexpected talents, and is now in full stride.

The goal, however, is not merely to dispel the present cloud of war, but—so great have been the strides and so certain the ultimate success—to establish permanent machinery for an enduring peace among all nations. The intellect of the world is engaged upon that problem; it is the paramount thought among all peoples. There is scarcely an article among the hundreds in these pages which does not in some respect touch upon the attainment of that goal. Success upon the battle fronts must come first, and, as these pages show, there has been no relaxation in the war effort, but there will be a greater willingness among all nations to lay down arms and accept the terms of the victors if a just plan has been developed which will enable all peoples to live on equal terms with their neighbors. The theme in the preceding Year Book was of a world engaged in war; in this issue it may be described as a world groping toward permanent peace.

It is the constant aim of the editor to provide the most authoritative coverage of the records of the year that is obtainable. Each contributor is selected for his intimate knowledge of the field that he represents and for his recognized standing in that field. The book is thus not merely a source book from which future historians may derive an inestimable first-hand account of the happenings of the year 1943 in every major field of activity, but it is a "fact book," a current encyclopedia, by which any consultant may keep pace with the developments in the branch of learning, of industry, sport, or art in which he is interested or seeks to obtain data. Thus the reader may turn to Music, and see how there has been an upsurge of interest in the ballet in this country; or he may turn to Basketball to see what teams were the leading contenders in this sport. He may turn to Takation, for an analysis of this economic problem in 1943; or he may turn to Radio, Motion Pictures, and Theater, to see what were the outstanding performances in these fields. World War II and the histories and internal developments in all countries are covered with the customary painstaking accuracy.

The full list of contributors to this volume is shown in the following pages. Many on that list have appeared in previous issues of the Year Book; to them the editor would express his sincere appreciation for their continued cooperation in the production of this work. Some who have contributed in recent past years were, through wartime emergencies, unable to continue the association. One valued contributor over a number of years, Professor Albert Schinz, completed his annual review of French Literature just a few days before his death. Many will join the editor in regret over the loss of his able reviews.

A welcome is extended to our new contributors. Mr. John B. Powell, noted correspondent on Far Eastern affairs and editor of the China Weekly Review (Shanghai) for many years, now recovering from injury suffered in a Japanese internment camp, has prepared the historica and political sections of the articles China, Japan, and Russia. Mr. C. P. Trussell, Washing ton correspondent of The New York Times, in the article on the United States has described with remarkable comprehensiveness the intricate Washington scene; Major Charles F. Reid now of the Army Air Forces School of Applied Tactics, has covered the several territories and dependencies of the United States, and Mr. Herbert Wiltsee, of the Council of State Governments has excellently compiled the acts of the various State legislative bodies into State Legislation, a comparative review introduced for the first time in this edition. The historical section of Canada is the work of Dr. Alzada Comstock, professor of economics Mount Holyoke College. Professor D. F. Fleming, of Vanderbilt University, noted authority

6.10 1131146 T MAY 2 1944

### Foreword—Continued

on political science; has contributed the review of the World War during 1943, and Professor Grayson Kirk of Columbia University, who is also Research Associate of the Institute of International Studies, Yale University, is the author of the article, United Nations. The subject, Refugees, closely related to the war, is the work of Mr. George L. Warren, Executive Secretary of the President's Advisory Committee on Political Refugees.

In the non-political fields, Mr. H. E. Luedicke, Business News Editor of *The Journal of Commerce*, has prepared a number of excellent articles on various branches of industry and business, notably upon the Food Industry. The field of sports has been ably handled by Mr. Thomas V. Haney, of the staff of *The New York Times*. A new feature, Magazines, has been interestingly covered by Mr. A. S. Burack, Editor of *The Writer*. Insurance has been reviewed by Mr. Mervin Lane, an insurance broker and the author of several textbooks on that subject. Music is reviewed by Mr. Eugene Bonner, noted critic and formerly music editor of *The Outlook*. The several articles on the various minerals and metals, of crucial interest at the present time, are the careful work of Mr. Charles T. Post, regional news and technical editor of *The Iron Age*. And Dr. W. H. Potts, of the Southwestern Medical Foundation School of Medicine, has furnished the article Medicine and Surgery. The return of Miss Leila Mechlin to the Contributors staff is also welcomed.

Due to the fact that many of the technical and scientific articles contain information pertaining to military matters, all of such articles are regularly referred to the Review Branch, Bureau of Public Relations, U.S. War Department, before publication. Although all such information has been garnered from material that has appeared in one or more of a wide number of technical journals, there are at times military reasons that have led to a request for the omission of certain information. In one or two instances, despite the courtesies extended by the Review Branch, it has been impossible to clear the material and make the necessary omissions without leaving a gap in the page and unsatisfied cross references. The Editor can do no more than to explain the circumstances.

The Editor is especially grateful to the various members of his staff who, by relieving him of the majority of the details involved in the compilation of a reference work of this scope and magnitude, enabled him to concentrate most of his time and energy upon other important work on which he has been engaged. Without that competent assistance one work or the other would necessarily have been neglected. He thanks each of them, especially Mr. Ronald S. Kain, upon whose advice he leaned in the selection of various authorities in the political arena, and Miss Mamie Harmon, whom he regarded in this work as his alter ego and to whom, with the cooperation of the Kingsport Press, is largely due the credit for the publication of this book earlier in the year than any of its previous companions.

ACADEMY OF ARTS, Royal. The Royal Academy of Arts, founded by King George III in 1768, is maintained, through the public support of its Exhibi-tions, for the promotion of the Fine Arts. The Membership consists of forty Academicians and thirty Associates, elected by ballot by the Members from among the most distinguished painters, sculptors,

architects, and engravers practising in England.
During January and February, 1943, the Royal
Academy, in collaboration with the other principal Art Societies of Great Britain, held a United Artists' Exhibition of works to be sold in aid of H.R.H. The Duke of Gloucester's Red Cross and St. John Fund. From May 1 to August 7 it held its Summer Exhibition (the 175th) as usual. From September 3 to October 10 it lent the whole of its Galleries for an Exhibition of War Photographs (Daily Express), and during November for five concurrent Exhibitions: The London Group (paintings, drawings, and sculpture); London County Council County of London Plan; Paintings by Firemen Artists; Royal Society of Portrait Painters (paintings and draw-Society of Portrait Painters (paintings and drawings); Royal Institute of Painters in Water Colours. The Officers of the Royal Academy for 1943 are as follows: President and Trustee, Sir Edwin L. Lutyens, O.M., K.C.I.E., P.R.A.; Keeper, G. F. Kelly, R.A.; Treasurer and Trustee, E. V. Harris, O.B.E., R.A.; Trustees, Sir William Reid Dick, K.C.V.O., R.A., and W. R. Flint, R.A.; Secretary, Sir Walter R. M. Lamb, K.C.V.O.

ACADEMY OF ARTS AND LETTERS, American. A society founded in 1904 by members of the National Institute of Arts and Letters. Membership is limited to 50, vacancies being filled by elections from the membership of the Institute.

On May 12, 1943, a Special Meeting of the Academy was held, followed by a Public Cere-monial given jointly with the National Institute of Arts and Letters at which new members of the Institute were inducted, ten \$1,000 "Arts and Letters" Grants given, and medals of both institutions awarded. An exhibition of the works of Carl Milles, sculptor, recipient of the Academy's "Award of Merit Medal," together with works by newly elected Institute members and Grantees in Art, Literature, and Music, was opened on the same day in the Art Gallery and Museum, and continued through June 23. On October 22 the Annual Meetbuilding. The Exhibition in the Art Gallery and Museum was reopened and will continue for an indefinite period. This is free to the public.

The membership as of November, 1943, consisted

of the following in the order of their election: Bliss Perry, Nicholas Murray Butler, Herbert Adams, Archer Milton Huntington, Newton Booth Tarking-Archer Milton Huntington, Newton Booth Tarkington, Charles Dana Gibson, Royal Cortissoz, Wilbur L. Cross, Hermon A. MacNeil, James Earle Fraser, Robert Frost, James Truslow Adams, Adolph Alexander Weinman, Walter Damrosch, Anna Hyatt Huntington, Paul Manship, Eugene O'Neill, Henry Dwight Sedgwick, Walter Lippmann, M. A. de Wolfe Howe, Frank Jewett Mather, Jr., Stewart Edward White, Deems Taylor, Van Wyck Brooks, Herbert Putnam, William Adams Delano, Charles Warren, Bernard Berenson, Chauncey Brewster Tinker, Albert Spalding, Sinclair Lewis, Willa Cather, Ellen Glasgow, Thornton Wilder, Henry O. Taylor, Ralph Adams Cram, Edna St. Vincent Millay, Carl Sandburg, Agnes Repplier, Charles Hopkinson, Paul Philippe Cret, Eugene Speicher, Henry R. Shepley, John Alden Carpenter, John Sloan, Barry Faulkner, Edward W. Redfield, Gifford Beal, Frederick Law Olmsted, Ernest Bloch, and John Marin.

Officers elected in 1943 were: President, Walter Damrosch; Chancellor and Treasurer, James Truslow Adams; Secretary, Van Wyck Brooks; Directors: William Adams Delano, Charles Dana Gibson, Sinclair Lewis, Paul Manship, Deems Taylor, and Chauncey Brewster Tinker. Administrative of fices are at 633 West 155 St., New York City.

ACADEMY OF DESIGN, National. An organization of American artists, established in New York in 1825 and incorporated in 1828 for the purpose of "cultivation and extension of the arts of design." In 1906 the Society of American Artists merged with the

Academy.

The Academy maintains annual Exhibitions of painting, sculpture, and engraving, to which all artists may contribute, subject to jury. At these exhibitions various prizes are awarded. It conducts an Art School at which no tuition is charged. It also administers the Henry W. Ranger Fund for the purchase of paintings to be presented to various museums. Its membership is limited to professional painters, sculptors, workers in the graphic arts, and

The Academicians elected at the annual meeting

Jay Connaway, Gladys Rockmore Davis, Louis Kronberg, Albert Herter, Reginald Marsh, Everett Shinn, W. Lester Stevens. Sculptors—Donald De-Lue, Leo Lentelli. Architects—Henry R. Shepley.

Graphic Arts—John Winkler.

The Associates elected in April, 1943, were: Painters—Percy Albee, Louis Ritman, Floyd Gahman, Douglas Gorsline, Hilde B. Kayn, Giovanni Martino, William Meyerowitz, Clarence Millet, Dana Pond. Sculptors—Peter Dalton, Donald Hord. Graphic Arts—E. Hubert Deines, Lawrence Kupferman, Martin Petersen. Architects—William Van Allen Lawrence Grant White. Arthur Brown. Ir.

Allen, Lawrence Grant White, Arthur Brown, Jr. Elected Officers are: Hobart Nichols, President; John Taylor Arms, First Vice-President; Paul H. Manship, Second Vice-President; Georg Lober, Corresponding Secretary; J. Scott Williams, Assistant Corresponding Secretary; Raymond P. R. Neilson, Recording Secretary; Frederick Ballard Williams, Treasurer; Charles Keck, Assistant Treasurer. The Galleries and Executive Offices are located at 1083 Fifth Avenue, New York.

ACADEMY OF SCIENCES, National. A body of scientists incorporated by Act of Congress in 1863 for the purpose of investigating and reporting upon scientific subjects whenever called upon to do so by any department of the U.S. Government, with the proviso that the Academy shall receive no compensation for services to the Government but may be reimbursed for the actual expenses incurred in making such investigations and reports. Membership in the Academy is limited to 450 active members, who must be citizens of the United States; and 50 foreign associates. Names voted upon in the election of new members are nominated by the Section covering the branch of research in which the individual is working, upon a two-thirds vote of that Section. There are no applications for membership, as the proposed names originate upon suggestion by the existing membership.

At the present time the Academy is engaged to a large extent on Government problems concerned with scientific matters related to the war. These reports are confidential and are not published by the

Academy.

The Academy meets twice a year. The Annual Meeting is held in Washington on the fourth Monday of April, and the Autumn Meeting is generally held in the East and West in alternate years. For the duration of the war, both meetings are held in Washington and are confined to business sessions for members only. At the 1943 Annual Meeting the following medals were presented: Henry Draper Medal for 1942, to Ira Sprague Bowen; Agassiz Medal for 1942 with accompanying honorarium of \$300, to Columbus O'Donnell Iselin, II; Daniel Giraud Elliot Medals with accompanying honoraria of \$200, for 1935 to Edwin H. Colbert, for 1936 to Robert Cusliman Murphy; John J. Carty Medal and accompanying Award, \$4,000, to Edwin Grant Conklin

Twenty-six new members were elected at the 1943 Annual Meeting: Leason Heberling Adams, Abraham Adrian Albert, Jesse Wakefield Beams, Arthur Francis Buddington, Leonard Carmichael, William Henry Chandler, Edwin Joseph Cohn, John Nathaniel Couch, Theodosius Dobzhansky, Lee Alvin DuBridge, Leslie Clarence Dunn, Wallace Osgood Fenn, Paul Darwin Foote, Louis Plack Hammett, William Vermillon Houston, Walter Pearson Kelley, Warfield Theobald Longcope, Eli Kennerly Marshall, Jr., Leonor Michaelis, William Albert Noyes, Jr., Oswald Hope Robertson, Carl-Gustaf Arvid Rossby, Calvin Perry Stone, Charles

Vincent Taylor, Hubert Bradford Vickery, and Vladimir Kosma Zworykin. Six new foreign associates were elected at the same time: Alfonso Caso, Mexico; Sir Harold Spencer Jones, England; Richard Vynne Southwell, England; Charles Edward Spearman, England; Sir D'Arcy Wentworth Thompson, Scotland; Hendrik Johannes van der Bijl, South Africa.

The Academy publishes an Annual Report, scientific Memoirs, Biographical Memoirs of deceased members, and monthly Proceedings devoted to condensed reports of recent scientific discoveries. The Academy building, 2101 Constitution Avenue, Washington, is closed to the public for the dura-

tion of the war.

ACCIDENTS. Accidental deaths in 1943 totaled approximately 94,500, a decrease of 1,400, or about 1½ per cent, from the 1942 total of 95,889, according to National Safety Council estimates. Nonfatal injuries, on the other hand, are estimated to have increased 3 per cent from 9,400,000 to 9,700,000.

Direct costs—including wage loss, medical expense, overhead costs of insurance, and property damage in motor vehicle accidents and fires—declined from \$3,900,000,000 to \$3,700,000,000. Indirect costs of occupational accidents—such as interference with production, damaged materials and machinery, time lost by workers other than the injured—amounted to about \$1,300,000,000, which carried total costs up to more than \$5,000,000,000.

The following table shows the 1942 and 1943 death totals for the principal classes of accidents.

|                                 | 1943   |        | Change   |
|---------------------------------|--------|--------|--|
| Total                           | 94,500 | 95,889 | $-1\frac{1}{3}\%$ $+3\%$ $+3\%$ $+3\%$ $+44\%$ |
| Motor vehicle                   | 23,300 | 28,309 | -18%   |
| Public (ex. mot. veh.)—civilian | 15,500 | 15,000 | + 3%   |
| Home—civilian                   | 33,000 | 31.500 | + 5%   |
| Occupational—civilian           | 18,000 | 18,500 | - 3%   |
| Military personnel              | 9,500  | 6,600  | 十44%   |

Note: The motor vehicle death totals include some deaths also included in occupational, home and military personnel. The 1942 all-accident and motor vehicle totals are U.S. Census Bureau figures. All others are National Safety Council estimates.

The 1943 death rate per 100,000 population was approximately 70. Comparable rates are: 1940, 73.4; 1930, 80.5; 1920, 71.2; 1910, 84.4.

Heart disease, cancer, cerebral hemorrhage, and nephritis, were the only causes of death exceeding accidents in 1942, according to U.S. Census Bureau data. Preliminary information indicates that accidents ranked fifth in 1943, also. Among males, alone, accidents are the third most important cause of death, being exceeded by heart disease and cancer. From age 2 to 28, both sexes, accidents caused more deaths than any disease in 1941. Among males they were first from age 2 to 38.

The 1943 accidental deaths were distributed by age about as follows: 0-4 years, 8,050; 5-14 years, 6,850; 15-24 years, 12,550; 25-44 years, 19,400; 45-64 years, 20,100; 65 years and older 27,550. Probably more significant are the death rates per 100,000 population: 0-4 years, 65; 5-14 years, 32; 15-24 years, 54; 25-44 years, 49; 45-64 years, 73; 65 years and older, 276. The rate for 5-14 years will be seen to be only one-ninth of the 65 and older rate. In most recent years the rate for elderly people rose, while that for school children decreased, although in 1940, 1941, and 1943 there was a small reversal of this trend.

Deaths from motor vehicle accidents continued to decrease in 1943, but the reduction was not as great as the drop from 1941 to 1942. Fatality totals for the three years were: 1941, 39,969; 1942, 28,-

309; 1943, 23,330.

Vehicle mileage, as a result of nation-wide gas rationing throughout 1943, showed an even greater drop from 1942 to 1943 than from 1941 to 1942. The death rate based on vehicle mileage showed a small rise in 1943. The rates per 100,000,000 vehicle miles were: 1941, 12.7; 1942, 10.9; 1943,

Rural accident deaths in 1943 totaled approximately 12,800, or 23 per cent less than in 1942. Deaths from urban accidents numbered about 10,-500, a decline of only 10 per cent. Compared to 1941 the rural total represents a drop of 50 per cent, the urban total a decrease of 26 per cent.

Pedestrian deaths numbered approximately 9,600, or 10 per cent less than in 1942. Nonpedestrian deaths totaled 13,700, a decrease of 22 per cent.

Although the decrease in deaths was relatively large, children failed to share in it. Fatalities of children under 5 increased from 1,069 to 1,150, and those of the 5-14 age group went up from 1,991 to 2,150. In the 15 to 24 year group deaths dropped 30 per cent to 4,150.

Deaths of persons 25 to 44 years totaled approximately 6.00 persons 25 to 44 years 25 to 45 t

proximately 6,050, a 22 per cent decrease from the 1942 total. In the 45–64 year group the total went down 17 per cent to 6,050. Persons 65 years and over recorded a 13 per cent decline to 3,750.

In addition to the deaths, about 800,000 persons received nonfatal injuries in motor vehicle accidents during 1943, or one out of each 168 persons in the United States. Wage loss, medical expense and overhead costs of insurance amounted to about \$650,000,000, and property damage to approximately \$550,000,000—a grand total of \$1,200,-000,000.

The 1943 death toll from public (except motor vehicle) accidents was approximately 15,500, an increase of about 500 from the 1942 total of 15,000. Preliminary information indicates some increase in deaths from transportation accidents, falls, burns, and drownings, but a decrease in firearms accidents. There were three serious railroad accidents, with total deaths between 150 and 200. However, no disaster occurred similar to the 1942 Boston night club fire.

The increase was confined to children under 15 and persons 45 years and over. The fact that there was no increase for 15 to 44 years is probably accounted for by the large number of men going into the armed forces.

Injuries numbered approximately 1,900,000. The cost of fatal and nonfatal accidents is estimated at \$400,000,000 for wage loss, medical expense, and overhead costs of insurance

There were approximately 33,000 deaths from home accidents in 1943, an increase of 5 per cent from the 1942 total of 31,500. Injuries numbered about 4,950,000. Wage loss, medical expense, and overhead costs of insurance totaled \$600,000,000.

The largest increases in deaths were from asphyxiation, suffocation, burns, and falls. Poisonings and firearms accidents decreased slightly, while other types of fatal accidents showed little change from 1942

All of the rise in deaths occurred among children under 15 years and adults 45 years and older. There was a decrease in the number of fatalities of persons 15 to 44 years old, probably due in part to men going into the armed forces and in part to the fact that a great many women are now working who formerly spent much of their time at home.

Occupational Accidents. The decrease in deaths from occupational accidents from 18,500 in 1942 to 18,000 in 1943 was particularly notable because total exposure, as indicated by employment and

hours worked per week, was about 3½ per cent greater than in 1942. Nonfatal injuries, however, continued to increase, reaching a total of about 1,850,000, or 6 per cent more than in 1942.

Direct costs of occupational accidents—wage loss, medical expense, and overhead costs of in-surance—amounted to \$1,000,000,000. Indirect costs, such as time lost by supervisors and workers other than the injured, interrupted production schedules and damaged machinery, are estimated at about \$1,300,000,000, which places total costs for these accidents at \$2,300,000,000.

Two coal mining explosions occurred during 1943 killing a total of 100 workers. Apart from these accidents, however, there were no disasters in 1943 which resulted in the death of as many as 20 workers.

The figures above measure the size of the occupational accident problem in 1943, but they do not indicate the full extent to which accidents may interfere with production. In these days of manpower shortage, off-the-job accidents which keep employees away from work, or lower their efficiency while at work, must be counted as a factor in restricting output. The 1943 toll resulting from off-the-job accidents was 23,500 workers killed and 2,150,000 injured. The total loss from accidents to workers, on and off the job, thus was 41,500 deaths and nearly 4,000,000 injuries resulting in lost time beyond the day of the accident.

AERONAUTICS. Military necessities dominated aviation in the year 1943, although blueprints for air traffic in the postwar era were widely discussed. The mass production of aircraft exceeded all records. At the same time, the destruction of warplanes in sky battles surpassed that of previous years. The transport of troops and war equipment by air was greatly augmented; improvement of recent types of planes and invention of new types proceeded at a swift pace; while popular interest in aviation, both as an instrument of war and as a means for bringing all nations into close communi-

cation, was greatly increased.

Significance of Air Power in World War II. The winning of air supremacy by the United Nations, both in Europe and in the Pacific, was viewed as a definite turning point in World War II. The terrific battering of Germany by the U.S. Army Air Forces and the Royal Air Force was intended as the softening of the Festung Europa previous to the land invasion. In other words, the primary objective in bombing Germany was to make the coming invasion as economical as possible. This was to be accomplished, as General Henry H. Arnold, commanding general of the U.S. Army Air Forces, stated in his report for the year 1943, by drastically reducing the war potential of the Third Reich and its satellites by bombardment from the air.

The strategic air plan was predicated on the fundamental fact that American and British bombers could fly deep into enemy territory, drop an effective load of bombs and return to base without suffering losses disproportionate to the damage accomplished. The first step in the strategic bombing offensive used by the American-British air forces was the destruction of the enemy's fighter strength. The Luftwaffe could be destroyed on the ground, in the air, or in the various stages before it rolled off the production lines. Assuming that the nearer to the final assembly stage the enemy's aircraft is attacked the less time he will have to replenish his front-line strength, the AAF and the RAF frequently knocked out assembly plants. But, for more lasting damage to the enemy, both the AAF and the RAF concentrated on tar-

gets deeper in the industry. These targets—production plants of all kinds—were carefully selected for their importance in German armament.

Bombardment of Germany and Her Allies. Some of the missions over Germany in 1942 could rightly be called raids. But many of the assaults of 1943 were major battles that had to be planned as such. This was true regarding the missions against such targets as the Renault works at Paris, the Huls synthetic rubber plants, the Ploesti oil fields, the Heroya magnesium and aluminum plant in Norway, the Focke-Wulf assembly plant at Marienburg, the Schweinfurt ball-bearing plants and the Messerschmitt factory at Regensburg. The effects of these four-hour operations were felt more keenly than a protracted ground struggle for a particular locality. Crippling blows were struck by these missions at relatively small cost. The AAF lost 60 Flying Fortresses at Schweinfurt in the August raid, but the attack was so accurate and severe that months would be required to rebuild the plants. Twenty-four planes were lost in the twin raid on Regensburg, but the Luftwaffe suffered a production loss of 500 Me109's as well as 195 fighters that were destroyed or damaged in the air.

The equipment of the escort fighter planes with extra long-range disposable fuel tanks enabled them to give the bombers continuous cover to and from targets formerly out of tactical range. The development of navigational aids which were so accurate that enemy targets could be attacked by bombing through the overcast or at night greatly increased the deadly effectiveness of every mission over enemy territory.

The operations of the AAF and the RAF continued in 1943 as in 1942 to be complementary.

# TONNAGE DROPPED BY ALLIED PLANES IN FOUR YEARS OF WAR 1940 1941 1942 EACH SYMBOL 25,000 TONS OF BOMBS DROPPED BY THE RAF AND USAAF

The night bombing of the RAF devastated large areas such as Berlin and the Ruhr cities. The day operations of the AAF brought accurate bomb-

ing of production targets.

Three trends of the Luftwaffe reaction to the AAF operations were reported by General Arnold in his 1943 report. (1) General unwillingness of Nazi fighter planes to join combat with invading aircraft other than heavy bomber formations; (2) furious all-out attack, with little heed of fighter losses, on heavy bombers dispatched against key targets; and (3) increasing employment of fighters equipped with cannon larger than 20 mm. caliber and of twin-engined fighters firing long range rocket projectiles.

The American and British air commands were convinced that the attrition of German fighter aircraft on the Western front would eventually bring the destruction of the *Luftwaffe* as an effective air force. If the same rate of attrition were maintained and German aircraft factories producing these fighters continued to suffer progressive destruction, a point would be reached when Nazi reserves would be exhausted and only a trickle of

new replacement supplied.

The bombardment of Germany was in a large measure the result of the autonomy of the air forces under the high command. In Britain, the RAF was one of the three armed services. In the United States, the AAF was a part of the Army. But, under General Arnold, the AAF attained virtual autonomy within the Army. Thus, the Army Air Force worked with, but not under the ground power. It was claimed that the large and modern Italian air force in Libya in 1940 missed its opportunity to knock out the British air force because it was held down to the protection of the Italian ground forces under Marshal Graziani.

Critics of the independence of the air force contended that the aerial bombardment of Germany was not the proper employment for this branch of the armed services. Brig. Gen. Henry J. Reilly, among others, held that air strength should be concentrated in battle to support ground troops and advance them against the enemy. The bombardment of industrial targets in Germany was a dissipation of strategic forces. Tactically, these critics held, too much air power was scattered over the rear of battlefields instead of being concentrated on the enemy's infantry, tanks, and artillery.

Air Power in the Pacific. In the view of the American air command, the original Japanese master plan of conquest was essentially sound, with the exception of the assumption that the United States would eventually yield to war weariness. By a bold attack, Japan amassed the raw materials needed to maintain the Empire on a war economy and also ringed this empire with defensive positions. No traditional mode of naval or land warfare could have broken through the defensive ring that Japan counted on for consolidation of the New Order in Greater East Asia. In fact, throughout the year 1943 the ring remained intact.

Holding that offense is the essence of air power, AAF bombers operating with Navy aircraft and surface warships effectively stopped the sea-borne Japanese forces. The strategy of the Coral Sea and Midway actions in May and June of 1942 were continued in 1943. In March, 1943, the Southwest Pacific Air Force, under Lieut. Gen. George C. Kenney, inflicted a smashing defeat upon a large Japanese convoy in the Bismarck Sea. In this engagement, 162 Allied aircraft sank three cruisers, seven destroyers, and twelve transports, besides destroying fifty-nine planes and causing

the death of 12,700 Japanese airmen, sailors, and troops. The Allied forces lost only one bomber and three fighters in the combat.

The American air command in 1943 made no secret of its view that China was the most important base for the long-expected attack upon the mainland of Japan. In the words of General Arnold. the AAF had no intention of allowing air operations in China against Japan to remain on the basis of guerrilla warfare. It was planned to mass sufficient air power in China to destroy the shipping and war industry of the Japanese mainland

even before the armed forces should crumble.

See also Military Progress; Naval Progress;

World War.

Size of American Air Forces. The growth in the American air forces reached phenomenal proportions by the end of 1943. When the Japanese attacked Pearl Harbor in 1941, the entire combat strength of the AAF in America as well as the Pacific was barely 3,000 planes, of which only 1,157 were actually suited to combat service. The AAF possessed only 159 heavy-engined bombers. In Hawaii and the Philippines, there were only 526 planes of all types, and within a few hours only 176 remained. Fourteen Flying Fortresses fought their way to Australia and there formed the nucleus of the now powerful Fifth Air Force.

Out of this disaster rose the most powerful air force in the history of warfare. In 1943, the AAF included 2,385,000 officers and men. As of Oct. 31, 1943, the AAF had flown over a quarter of a million combat sorties, expended more than 40,000,000 rounds of ammunition, used 2 billion gallons of gasoline, destroyed in aerial combat 8,478 enemy planes, probably destroyed 2,555 more planes, and damaged another 2,834. These figures did not include enemy aircraft destroyed on the ground, nor the extraordinary score made by the American Volunteer Group in China under Brig. Gen. Claire L. Chennault. Of the 145,000 airplanes scheduled for production in the fifteen months following Jan. 1, 1944, it was expected that the greater part would go to the AAF.

American Aircraft Production. The remarkable de-

American Aircraft Production. The remarkable development of the American air forces was only possible through the gigantic expansion of the aircraft industry in the United States which not only equipped the Army and Navy air services but also, through Lend-Lease, supplied a large share of the air equipment of Soviet Russia, Britain, China, and other allies. In 1939, American aircraft plants built 6,315 planes with a total weight of airframes amounting to 6,600,000 pounds. In 1943, the production had gone up to 86,000 planes having a

EXPANSION OF AMERICAN AIRPLANE INDUSTRY

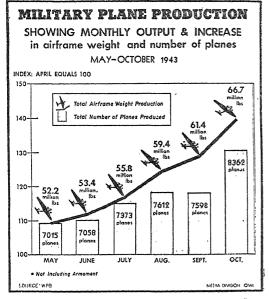

| Year | Number of<br>Planes<br>Built | Weight of<br>Airframes<br>in pounds                                 |
|------|------------------------------|---|
| 1939 | 12,248<br>19,500<br>48,000   | 6,600,000<br>20,700,000<br>83,500,000<br>276,000,000<br>667,000,000 |

total airframe weight of 667,000,000 pounds. Not only did American industry produce more airplanes but also the size and weight of the average plane was greatly increased. The dollar value of airframes, engines, and propellers produced in 1943 was about \$11,000,000,000 which was more than twice the value of \$5,000,000,000 in 1942 and more than six times the value of \$1,750,000,000 in 1941.

This rise in production was achieved with increases of only 50 per cent in plant area and 45

per cent in employees over the year 1942, according to the conservative estimates of the Aeronautical Chamber of Commerce. At the same time, the improvement in output-per-employee was almost 60 per cent. The total number of employees in airframe, engine, and propeller factories at the end of 1943 was 1,400,000, of whom 40 per cent were women. This compared with totals of 970,000 at the end of 1941. By order of the War Manpower Commission, aircraft plant workers in California and Washington, where there was an acute shortage of labor, were given a temporary deferment from the draft.

From July, 1940, to December, 1943, over 167,000 military airplanes were manufactured in the United States. Starting at a monthly rate of 572

planes, the rate increased to 8,862 in December, 1943. American production of 85,919 planes in 1943 exceeded the total output of the Axis powers by two to one, and was greater than that of all other countries combined. Blueprints for 1944 called for a monthly production of 10,000 American planes.

As in 1942, almost one-fourth of the aircraft production in 1943 went to the Allies of the United States under Lend-Lease (q.v.). By September, 1943, this Government had sent Soviet Russia over 7,000 combat planes as well as large quantities of tauks and trucks. In March, Adm. William H. Standley, American ambassador, told a Moscow press conference that Russian newspapers had systematically failed to mention the thousands of planes that Russia had received from the United States. In the following weeks the official newspapers Pravda and Izvestia informed the Russian people of this American aid.

rials, as Aluminum; Magnesium.

German and Japanese Aircraft Production. In spite of the 250,000 tons of bombs dropped on Germany by American and British air forces in 1943, the German industry was able to increase the first line lighter strength of the Luftwaffe by more than one thousand aircraft. The concentration on fighters was obviously a result of the new stage of the war opened by the devastating attacks of the AAF and the RAF through the weakest defense of the

Festung Europa, namely, its roof. It was estimated that three-fourths of the new Nazi fighters were assigned to northwest Europe in order to serve as an interceptor force against attacks by Allied heavy bombers on industrial targets in Germany.

COMPARISON OF AIR FORCES IN 1943 NUMBER OF FIRST-CLASS MILITARY PLANES

| United Nations | Planes | Axis Powers        | Planes     |
|----------------|--------|--------------------|------------|
| United States  | 42,000 | Germany            | 28,000     |
| Great Britain  | 26,000 | Japan              | 18,000     |
| Soviet Russia  | 18,000 | Hungary<br>Rumania | 400<br>500 |
| China          | 400    | Bulgaria           | 200        |
| Total          | 86,400 | Total              | 47,100     |

At the same time, the new fighters were to serve as the nucleus of the air defense against a northern invasion.

The manufacture of German heavy bombers, especially the four-engined Heinkel-177 was continued. The *Luftwaffe* was still well equipped to carry out raids of 300 bombers on British targets

at any favorable moment.

The production of German aircraft was a remarkable achievement in view of the severe damaging of Nazi aircraft plants. The RAF claimed that in 1943, twenty of Germany's biggest industrial cities had been crippled. Lieut. Gen. Carl A. Spaatz, commander of the American Strategic Bombing Force on the Western Front, estimated that the AAF and RAF had knocked out 40 per cent of Germany's planned fighter production in the latter part of 1943. Under the terrific blows of the Allied air forces, German industry had the benefit of the policy of the Technical Directorate of the Luftwaffe which early in the war split up the manufacture of parts of warplanes among plants all over Germany. The advantage of this deconcentration of the aircraft industry, however, depended upon the maintenance of an adequate transport system. The deterioration of German railways by hard use, lack of new equipment, and bombardment from the Allies tended to retard the production of aircraft even more severely than if the industry had remained fully concentrated.

the industry had remained fully concentrated.

The temporary immunity of Japanese aircraft plants from bombardment permitted uninterrupted progress in production. The satellite countries of the Greater East Asia Sphere of Co-prosperity readily supplied what metals were lacking on the Japanese mainland. Thus, losses to the Japanese air forces were almost entirely due to defeats suffered in the air battles on the periphery of the new Empire. Although a considerable expansion of aircraft plants took place, there was reason to believe that in 1943 Nippon, in anticipation of American bombardment of Honshu, Kyushu, and Shikoku, had imitated the German plan of scattering the industry throughout the country. The Mitsubishi Jukogo Kabushiki Kaisha (Mitsubishi Heavy Industries Corporation) whose aircraft and aero-engine plants had been concentrated around Nagoya and the Nakajima Aircraft Corporation whose plants were at Ohtamachi now built new shops in other parts of Japan. Several new types of Nipponese warplanes went into mass production, like the Shoki fighter, the Donryu heavy bomber, and the Shitei patrol bomber. The nationwide reorganization of Japanese industry into three great divisions under the Industrial Adjustment Act of June, 1943, was undertaken in order to speed up the production of both ships and aircraft. By the end of the year, Japanese first-line military planes had been increased by over 50 per cent.

Types of American Military Aircraft. Throughout

most of the year 1948 the American aircraft industry built in mass production eight types of fighter planes, two types of heavy four-engined bombers, five types of medium, light, and dive bombers, five types of Navy patrol bombers, and

two types of Navy observation scout planes.

In a release of the Office of War Information on Oct. 17, 1943, these types were described as

follows:

Fighters

Curtiss P-40 (Warhawk). In the opinion of the Materiel Command this famous plane has reached the limit of its developmental possibilities, and after this year it will be produced only in limited quantities, for operational training and for replacement in theaters where they have proved highly successful. The basic P-40 was designed before the war, and was the only fighter in quantity production when the Japs struck at Pearl Harbor. It has gone through numerous type changes. Beginning with the P-40F, both Allison and Merlin engines have been used. From the F to the latest model, the changes have been minor. In all types and over every front the P-40 has made history—and is still making it, although newer fighters excel it in speed and climb. Equipped with light bombs for destruction of ground objectives, P-40's helped stop Rommel's drive in Egypt in the summer of 1942. P-40's ran up the big box score in China, downed the 58 Axis troop transports in the famous battle off Tunisia, and were kept busy over Sicily and Kiska. On July 22, in a contest over Southern Sardinia between 45 P-40's and 25 to 30 enemy fighters, the P-40's shot down 17 of the enemy with a loss of only two of their own runbar. We is a second to the context of the following two of their own runbar. southern Sardina between 45 F-40's and 25 to 30 enemy fighters, the P-40's shot down 17 of the enemy with a loss of only two of their own number. But in the case of the P-40, these highlights are less important than the fact of its long, steady performance in all climates and over all terrains, from the Russian steppes to the swamps of New Grings.

P-40, these highlights are less important than the fact of its long, steady performance in all climates and over all terrains, from the Russian steppes to the swamps of New Guinea.

Bell P-39 (Airacobra). Although in the latest model P-39 ceiling and general performance have been improved, the P-39 has shared the climb-deficiency of the P-40. It has, however, been used successfully on a wide variety of fronts, including Russia, Alaska, New Guinea, and the Solomons. It is being supplanted by a new model now under construction, with a low drag wing and a two-stage Allison supercharged engine which will make it an efficient plane at any altitude up to 38,000 or 40,000 feet. The greatest efficiency of the P-39 models has been below 15,000 feet. Like the P-39, the new plane will be equipped with cannon as well as machine-guns. About half the total production of P-39's has gone to Russia, where the plane has been particularly effective as a ground-strafing tank-buster in all campaigns from Stalingrad to present operations. In one three-month period a Soviet Air Force Guards group knocked down 33 German planes at the cost of three P-39's, and there is a veteran P-39 fying in Russia today with 31 stars painted on its fuselage, one for each German plane it has destroyed. On August 15, over New Guinea, a force of Airacobras downed three Zeros and eleven Jap bombers, losing three of its own planes.

North American P-51 (Mustang). The original P-51 was a low-and-medium-altitude fighter. Now in production is a new P-51 with a highly super-charged, Packard-built, Rolls-Royce Merlin engine, similar to the Merlin 61 engine in the newest Spitfires. Its performance is reported as even better than that famous ship's. The new engine gives the plane the highest speed (well over 400 miles an hour) of any fighter in existence. The A-36 (Invader), the fighter-bomber version of the P-51, has seen heavy service in the Mediterranean theater, and its best features are being incorporated in the new P-51, which will replace both the A-36 an

altitude strafing, high-altitude fighting, and as a particularly long-range bomber escort. Its distinctive silhouette, with its twin tail booms, has been seen over four major fighting fronts—the Aleutians, New Guinea, North Africa, and Europe. All escorts on the second raid on Rome on August 13 were P-38's. In the daring surprise raid on Roggia on August 25, P-38's flew at only 75-100 feet above the ground. Its especially long range permits it to be ferried directly from bases in the United States to certain combat areas. The two engines of the P-38 provide construction of the plane forces the enemy chaonic three targets: the two engines, and the pilot. This is in contrast to other fighters where the pilot and engine together form but one target.

Republic P-47 (Thunderbolt). The newest fighter at gresent in combat, the P-47, has been currently rolling up a score of approximately four to one in its contests with Messerschmits and high-flying Focke-Wulfs over England, France, and the Low Countries. Armed with eight.50 caliber machine guns, and heavily armor-plated, it is capable of flying over 400 miles an hour and of reaching an altitude of 40,000 feet. This 'hnge, streamlined milk bottle,' acuipped with a called, with only army fighter to hereologal Double Wasp engine (Ford-built Pratt & Whitner); the size of this great power plant is apparent from the plane's silkouette. Additional horsepower is being provided in newer models to increase the plane's rate of climb and ogive it still greater speed. It is generally considered the world's best single-engine fighter for high-altitude operations. On July 30, P-47's supporting B-17's bombing Rassel in Central Germany shot down 25 Nazi fighters with also sof six. On September 25, P-47's gave fighter protection to Fortresses on an 800 mile flight to Emden. It was the first time that our bombers received fighter escort on such a long strip from English bases.

Wildert Twin Wasp air-cooled engine and with folding wings for compact stowage on aircraft carriers, has run u

## Heavy Bombers

Boeing B-17 (Flying Fortress) and Consolidated B-24 (Liberator). The newest models of both bombers are equipped with new defensive armament in the form of nose turrets with machine gun installations. External bombturrets with machine gun installations. External bombracks can increase the potential bomb capacity of the B-17 to 20,800 pounds. Nevertheless, this plane has a slightly smaller bomb capacity at long range than the B-24. The B-17 is being concentrated in the Western European theater and the B-24 is being used chiefly elsewhere—in the Middle East, in India, China, and Australia—for longer range operations. B-24's have made round-trip flights up to 2,600 miles; the raid on the Ploesti oil fields in Rumania from bases in Egypt, the raid on the Messerschmitt works at Wiener-Neustadt, and raids in the Pacific to Wake, Paramushiru, and Surabaya. The B-24 is used by the Navy under the designation PB4Y-I, for land bombers in the South Pacific and for anti-submarine warfare. The B-17, with its Wright Cyclone engines, and the B-24, with its Pratt & Whitneys, have set an unrivalled record for large-scale, precise, daylight destruction of enemy targets. The past year has proved to the hilt the validity of the American theory of precision daylight bombing which aims to destroy key parts of highly strategic industries such as fighter aircraft factories, oil and rubber plants, and power installations. Heavy night-bombing of European targets continues to be accomplished chiefly by British Lancasters and Hallfaxes. and Halifaxes.

### Medium, Light, and Dive Bombers

North American B-25 (Mitchell). New models of this two-engine Tokio raider are equipped with heavier armament and possess increased speed and range. The B-25 is the chief medium bomber in the present program, production of the Martin B-26 (Marauder) being tapered off. B-25's powered with Wright Cyclone engines, are flying on eleven fronts, are used by both Army and Navy for antisubmarine patrol service, and have scored particular successes with skip-bombing.

Martin B-26 (Marauler). Despite its high speed, good

Martin B-26 (Marauler). Despite its high speed, good load capacity, and excellent combat performance in several theaters, notably in New Guinea, the Mediterranean, and Europe, the production of this plane is being tapered off. Air Forces' policy is to reduce the number of models, concentrating production on highest performance types in a combat classification. Changing demands of tactical operations also entered into the decision to use trained Martin personnel and factory space for production of other more preparative required bomber types.

personnel and factory space for production of other more urgently required bomber types.

Douglas A-20 (Havoc). This is the principal light Army bomber in the program until the totally new, advanced light bomber mentioned above comes into production. The newest Havoc, used by the Army for low-level bombing, is fitted with a power turret and with armament for ground strafing. A-20's powered with Wright Cyclone engines, are highly versatile, and have been active over Tunisia, Australia, and New Guinea. A-20's are widely used by the RAF under the designation "Boston." The A-24, Army version of the Douglas SBD (Dauntless) dive-bomber, is now heing produced in decreasing numbers, chiefly for training purposes.

now being produced in decreasing numbers, chiefly for training purposes.

Douglas SBD (Dauntless) dive-bomber. Improved SBD's with increased horsepower and armament have gone into combut areas in large numbers. They have dive-bombed many Jap vessels to the bottom and destroyed many fighters. On some occasions in the Pacific, SBD's have taken on jobs more properly done by fighters, as for instance acting as patrol against Jap torpedo and dive-bombers. In some of those engagements the SBD's have suffered heavily from the Japs' fighter escorts; in others they have made brilliant scores.

Grumman TBF (Avenger). This is the Navy's carrier-based torpedo-bomber, which has completely supplanted the Douglas TBD (Devastator). It carries machine guns as well as torpedo or bombs, and has destroyed many Japanese vessels in the Pacific.

Navy Patrol Bombers

# Navy Patrol Bombers

Navy Patrol Bombers

Chief among the Navy's patrol bombers are three flying boats and two land planes. The land planes are the Consolidated PB4Y-1 and the Vega PV-1. The flying boats are the Consolidated PBY (Catalina), Consolidated PB2Y (Coronado), and Martin PBM (Mariner). All three flying boats are used for transport purposes as well as for patrol and bombing operations. The two-engine PBY, the oldest, slowest, and smallest, the ship which first spotted the Jap forces on the Alcutians, is still being built, still dive-bombing and strafing enemy slipping and rescuing pilots who have been downed at sea. The four-engine PB2Y has double the horsepower of the PBY. The PBM does good work in anti-submarine coastal patrol and long-range reconnaissance. Not even the newest Navy flying boats have speeds much above 200 miles an hour, but all are required to be able to land in a choppy sea with four to five foot waves. The Vega PV-1 (a Navy adaptation of the twinengined Vega B-34 "Ventura" bomber) is the Navy's defted land-based anti-submarine patrol plane. It carries depth charges or a torpedo, is heavily armored, and is now often used in preference to flying boats in anti-submarine operations because of its greater speed. The Consolidated PB4Y-1 is a 4-engine land-based bomber and, as previously mentioned, is used for long-range bombing missions and for anti-submarine patrol work. and for anti-submarine patrol work

## Navy Observation Scouts

Navy's observation scouts are the Vought Kingfisher OS2U-3 and the Curtiss Seagull SO3C-2. They are used principally on cruisers and battleships for patrol and observing naval artillery fire. These Navy observation scouts were used effectively in the African and Sicilian campaign in spotting positions of tanks, guns, trucks, and other enemy equipment, and reporting it to naval craft for heavy-intent. bombardment.

In October, General Arnold partially lifted the ban on information regarding a third American super-bomber, the Boeing B-29. This plane, developed in close cooperation between the Boeing staff at Seattle and the AAF and its Materiel Command, was said to be as far ahead of the B-17 and B-24 as the Flying Fortresses surpassed the prewar bombers. The new bombers would be able, the AAF disclosed, to attack Germany from American shores and Japan from points now held by Allied forces.

A new type of dive bomber, the Curtiss-Wright Helldiver, officially designated as SB2C, was put to combat test in the attack on Rabaul on Armistice Day. In this raid, a squadron of Helldivers sank a light cruiser and a destroyer, damaged another light cruiser and probably damaged as second destroyer. The total score of all American planes in this engagement was: 1 light cruiser and 2 destroyers sunk; 2 heavy cruisers, 1 light cruiser, and 8 destroyers damaged; and 88 enemy planes destroyed. The Helldivers, larger and heavier than other American divers, came through the battle without loss. The new Curtiss SB2C was powered by a Wright Cyclone engine with Curtiss constant speed and full-feathering propeller.

In December, the War Department disclosed that two new and superior Army fighter planes were in production and would soon join the Lockheed P-38 (Lightning) and the Republic P-47 (Thunderbolt). When the new planes should pass the combat tests they would displace the old types. Toward the end of the year, the Army Air Forces had also secured production of a powerful new night fighter, a twin-engined plane called the Black Widow. Officially known as the P-61, the new fighter was heavily armored and equipped with new devices for attack on enemy bombers. Powered by two Pratt & Whitney engines, it possessed a long cruising range, great speed, and climbing performance.

American Transports. The year 1943 witnessed extensive use of available planes for wartime air transport and the manufacture of many new models. Transport planes for military use included: (1) airline planes taken over by the Army in 1942; (2) bombers used for transport without alterations and other bombers manufactured in converted design; and (3) newer airplanes, designed for commercial passenger operation, but delivered to military use before being placed in commercial operation. Outstanding service was rendered by the Douglas DC-3, frequently called "The workhorse of the air lines." No models of the Douglas DC-3 were delivered to commercial lines after January, 1943, but instead they were manufactured in several models for the Army and Navy. The Army C-47 (Skytrain) had a large door for loading of cargo, a metal floor, and reinforced landing gear. The Army C-53 (Skytrooper) was equipped with a wooden floor, benches along the sides for troops, and a tow cleat on the tail for glider towing. The Navy designations of the same plane were R4D-1,

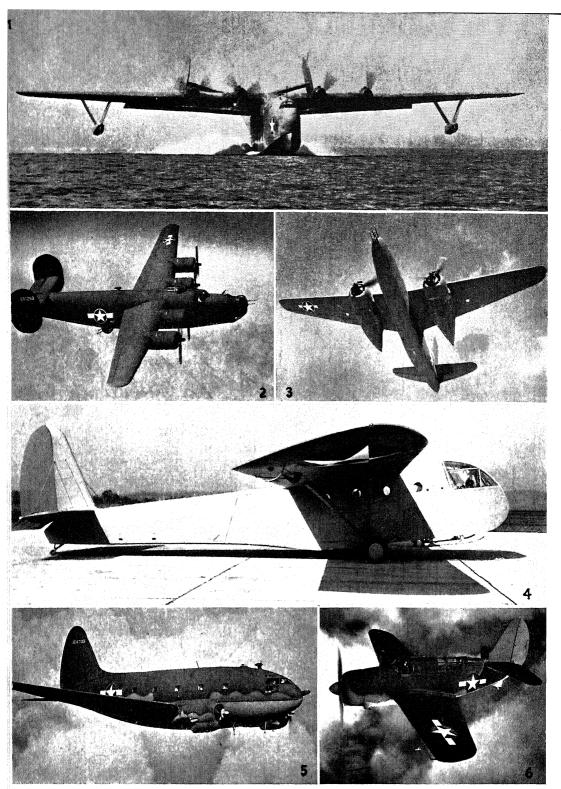

3, 4, and 5 according to details in structure.

Both the Skytrain and the Skytrooper were powered by twin 1,200 h.p. engines. The standard gross weight for commercial operations had been 25,200 pounds, but the Douglas C-45 was frequently flown at 29,000 pounds. Empty, the C-45 weighed 17,000 pounds. The fuel capacity was 822 gallons, the average cruising speed 180 miles per hour, and the average cargo load 5,000 pounds. It had a range of 1,500 miles without refueling. The normal fuel capacity could be doubled by the installation of tanks in the fuselage for trans-At-

lantic or trans-Pacific flights. Thus heavily loaded, the plane had a range of 3,000 miles, and frequently flew from Hamilton Field in California

to Hickam Field in Hawaii.

For military personnel and cargo transport, these Douglas planes are used more than any other model. In 1942, the Army C-53 flew American and British paratroops the 1,500 miles from England to Africa. Its troop-carrying capacity was 28 plus a crew of 4. In 1943, the Douglas C-47 began to be displaced by the C-46 which at a 1,500-mile range carried almost twice as much cargo, namely four jeeps or six airplane engines in boxes.

Another transport type was the Boeing 314 Flying Boat (Clipper). Formerly in exclusive operation by the Pan American Airways, the Boeing 314 was until late in 1943 the largest airplane in general use and carried the largest passenger load. In service since 1939, and licensed to carry 74 passengers and 15 crew, the Clipper had carried this load only on short hops as from New York to Bermuda. Only 58 passengers were carried on flights across the Atlantic. With a 150-foot wing span, it was propelled by four 1,600 h.p. engines of the Wright R-2600 model. It had a gross weight of 84,000 pounds, but was sometimes flown at 88,000 pounds with heavy cargo. The commercial or useful load was 38,000 pounds. The average cruising speed was 143 miles and the plane could make 200 miles per hour. The fuel capacity

was 5,448 gallons. It was in a Boeing Clipper that President Roosevelt crossed the Atlantic for the historic Casablanca Conference in January, 1943. The Boeing 307 (Stratoliner), in service since 1940, was the first airplane to introduce a pressurized cabin in air transportation. This device permitted passengers and crew to enjoy low altitude flight conditions while flying at high altitudes. Pressurizing began at an altitude of 8,000 feet, the ratio of the air inside the cabin to the air outside the cabin increased proportionately with the altitude. The Stratoliner was powered by four 1,100-h.p. engines. The gross weight was 45,000 pounds. Empty it weighed 29,000 pounds. The cargo capacity was 8,000 pounds on a 1,000-mile flight. The fuel capacity was 1,700 gallons, and the cruising speed was 185 miles per hour. It carried 33 passengers and a crew of five. Built originally for the TWA (Transcontinental and Western Airline), the Stratoliners were taken over by the Army in 1942. As Army C-75, these planes were used in establishing the Air Transport Command over routes to Africa and India. In 1943, the building of the plane was discontinued in favor of the C-54A.

In 1943, many bomber planes were used for transport purposes without any alterations. Bombers that were being ferried abroad for foreign service carried personnel and strategic cargo which was discharged before going into combat service. Among the bombers that were manufactured in converted design was the Consolidated C-87 (Liberator Express). This was the transport version of the Consolidated B-24, the famous Liberator Bomber. Propelled by four 1,200-h.p. Pratt and Whitney R-1830 engines, these 29-ton planes had a cargo capacity of 10,000 pounds on 1,000-mile flights and 6,000 on the longest transoceanic ranges. With its high wing, its enlarged sidedoor, and tricycle landing gear, the Consolidated C-87 was an easy ship to load. But, like all bombers, its cubic capacity for freight was small. It held 20 passengers and 5 crew, but could take no jeeps. With added gas tanks it had a 3,000-mile range.

In 1943, more C-87's were used by the Army Transport Command than any other four-engined plane, but it was being superseded by the C-54 which had better cargo facilities and more efficient performance. It was a Consolidated C-87 in which Wendell Willkie made his round-the-world flight in 1943

In 1943, the Army Transport Command employed a large number of newer airliners, designed for passenger and cargo operation but delivered to military use before being put into commercial service. Among these types was the Douglas DC-4 (Skymaster) which bore the Army designation of C-54 when designed as a passenger transport and C-54A as a cargo carrier. The Navy designation was R5D. Propelled by four 1,350-h.p. engines, it had a gross weight of 66,000 pounds, with a pay load of 14,000 pounds. The cruising speed was 200 miles; the fuel capacity was 3,700 gallons with four fuselage tanks in use. In December, 1943, President Roosevelt, following the Teheran Conference flew over the battlefields of North Africa and visited Malta in a Douglas C-54.

The Curtiss-Wright Commando became Army C-46. Originally designed as Model CW-20, with a passenger capacity of 30 and 4 crew, this plane was first operated in 1941 on British government airways. It was one of the most efficient two-engined carriers for hops under 1,500 miles. It carried 40 paratroops, or else three jeeps, or two light tanks of 4,000 pounds each. Powered by two 2,000 h.p. Pratt and Whitney R-2800 engines, with a wingspread of 108 feet, it had a gross weight of 48,000 pounds, and carried a pay load of 10,000 pounds on a 1,000 mile flight. The fuel capacity

was 1,000 gallons.

Among the planes introduced but subsequently discontinued was the Curtiss-Wright C-76 (Caravan), the first plane to be designed as a short-route cargo carrier. Constructed entirely of plywood rather than aluminum alloy, it was powered by two engines. Speed was sacrificed for loading ease.

The Lockheed C-69 (Constellation) was designed to fill the need for a long-range passenger transport plane with a pressurized cabin to permit flights in the substratosphere at altitudes above 20,000 feet without discomfort to the passengers and crew. The plane had four 2,200-h.p. Wright R-3350 engines, a gross weight of 73,500 pounds, and a fuel capacity of 4,800 gallons. It had a cruising speed of 255 miles at sea level which increased to 300 miles at an altitude of 19,000 feet. The wingspread was 123 feet and the length, 95 feet. Built to carry 55 passengers, this gigantic plane was designed as a troopship in wartime, while it was proposed as a new development for postwar commercial use.

In December, 1948, a new flying cargo boat, the Martin XPB2M-1 (Mars) completed its first war mission in the Naval Air Transport Service. It flew from Patuxent River in Maryland to Natal in Brazil, in a nonstop trip of 4,375 miles, carrying 13,-000 pounds of Christmas mail to the armed forces. From Natal, the Mars returned to Patuxent with three stops, and carrying from Belem to Port-of-Spain a record cargo of 35,000 pounds of war materials. Propelled by four 2,000 h.p. engines, this sea monster had a wingspan of 200 feet, a length of 117 feet and a height of 36 feet. Its weight was 140,000 pounds. As a troopship it could carry 150 men and a crew of 11.

British Types. In 1943, the Spitfire and the Hurri-

cane which had won the Battle of Britain in 1940 were still the favorite fighters. (See preceding Year Book for details.) Latest models had new

devices of armament. The Hurricane Tank-buster now carried two 40 mm. cannon under its wings. A more recent addition to the Fighter Command of the Royal Air Force was the Typhoon, manufactured by Hawker Aircraft Ltd., the builders of the famous Hurricane. The Typhoon was a single-engine monoplane, highly maneuverable, with a speed in excess of 400 miles per hour, and even so carried an armament of twelve machine guns or else four cannon in its wings.

The Bomber Command included Wellingtons, Lancasters, Bristol Blenheims, Stirlings, and Halifaxes. (See preceding Year Book for details.) The surprise bomber of the RAF in 1943 was the Mosquito, built by de Havilland Aircraft. With an airframe made entirely of wood, and with a speed of 350 miles per hour, the Mosquito was probably the fastest bomber in the world. It carried a bombload of 2,000 pounds and made a notable record

in daylight bombing of Berlin.

In the field of transport, the newest development was the Avro York, a commercial version of the huge Royal Air Force Lancaster. Powered with four Rolls-Royce Merlin liquid cooled 1,200 h.p. motors driving three-blade constant-speed air-screws, this plane had a cruising speed of 180 miles per hour. With a wingspread of 102 feet and an over-all length of 78 feet it furnished accommodation for fifty passengers. See Great Britain under *History*.

Soviet Russian Types. Considerable secrecy continued to shroud Russian military aircraft. One of the latest fighter models was the LAGG-3. With an airframe like the Spitfire, this plane was constructed of plastic bonded wood. A 20 mm. cannon fired through a hollow airscrew shaft. With a 1,600 h.p. engine it had a maximum speed of 385 miles and could climb 10,000 feet in five minutes. Several models of the speedy YAK-1, designed by

Alexander Yakovlev, were in use.

The Iliuchin IL-2, usually known as the Stormovik, remained the best known of the Soviet planes. It was powered by a 1,300 h.p. AM-88 twelve-cylinder in-line motor and had a top speed of 280 miles. It was a fighter-bomber or low-level attack plane. Eight 56-pound rocket-propelled bombs were carried on racks beneath the wings in addition to an armament of two 32 mm. cannon and four machine guns. Flying low over Nazi tanks or troops, the Stormovik proved an effective tankbuster and ground strafer. A newer model, the Iliuchin IL-3, carried a gunner in addition to the pilot, who fired a cannon fitted in the rear of the cockpit enclosure. The Sukhon SU-2, a medium level single-engined bomber, came into use. The dive bomber and reconnaissance Petlyakov Pe-2 was used in large numbers by the Red Air Forces. It had a maximum speed of 300 miles per hour with a bomb load of 1,300 pounds. There was forward-firing armament of three machine guns and a rearward armament of three hand-operated guns. A later version, the Pe-3, had a dorsal turret at the rear of the cabin.

Among the heavy bombers much reliance was placed on the Iliuchin Db-3F. This was the first Russian bomber to attack Berlin. It also made raids on Königsberg, Danzig, and Warsaw, dislocating German traffic. The DB-8F was powered by two 1,100 h.p. M-88 engines. The maximum bomb load was two tons and the maximum range 2,500 miles; the speed was 365 miles per hour. The latest bomber type was the Er-2 designed by Yakovlev. Beyond the fact that it was propelled by two inline engines few details regarding its construction were known.

Besides these Russian designed planes, the Red Air Forces used large numbers of American planes under the following designations: the fighter plane Bell P-400 (Airacobra), the fighter Curtiss Hawk 87A3, the attack bomber Douglas DB-7b, and the reconnaissance flying-boat GST built by the Consolidated Aircraft Corporation.

Axis Types. The Luftwaffe entered World War II with one single-seat fighter, the Messerschmitt 109E; one single-motor Stuka or dive bomber, the Junkers 87B; one heavy bomber, the Heinkel 111H-2; and one reconnaissance-bomber, the Dornier 17. New types were designed but usually the multi-purpose of each plane was retained. For instance, the Heinkel 112's, Messerschmitt 109's, and the Focke-Wulf 190's could be used as fighters, fighter-bombers, ground attack planes, and reconnaissance planes. The Dornier 217 which appeared in 1942 was designed for both horizontal and dive bombing and torpedo carrying. This versatility of planes had the advantage of economy. It was, however, a drawback to achievement in specialized fields.

In 1943, the bulk of the fighters were Messerschmitt 210's and Focke-Wulf 190's. The ground attack planes included the Focke-Wulf 189 and Henschel Hs129. Originally powered by an Argus engine, the Hs129 was in 1943 fitted with Frenchbuilt Gnôme-Rhône radial motors. The Henschel was heavily armed; the 1943 model carried a 30 mm. cannon beneath the fuselage interchangeable with external bomb racks. For raids on Britain, the Dornier DO217E2 was used. For convoy raiding, the Germans still relied upon the Focke-Wulf Fw200k2 (Kurier II) which was a four-engined patrol bomber. This plane was developed from the Focke-Wulf Condor passenger and freight transport. It had a range of 2,000 miles at 170 miles per hour. The largest transport plane was the gigantic Messerschmitt Me323, powered by six engines. The nose, divided centrally, could be opened to admit a three-ton truck or a small tank. It could hold one hundred fully armed troops. Without adequate armament it was extremely vulnerable to attack. The Junkers Ju52-8mF was the latest version of the most used transport plane. It was powered by three 845 hp. BMW132Dc1 radial motors. During the final stages of the Tunisian campaign, fleets of Junkers 52 attempted to deliver supplies to the hard-pressed German army of Marshal Kesselring. Junkers 52s were also used to transport supplies to Marshal von Paulus when surrounded by the Red Army at Stalingrad.

The long heralded "secret weapon" of Hitler

turned out to be rocket-equipped German fighter planes. The rockets, one under each wing of the plane, were aimed like machine guns and dis-charged by electric fuses. The trajectory of the rockets was high and uncertain, but when lobbed from 1,000 yards into a close formation of heavy bombers they caused great damage. Bomber squadrons of the U.S. Eighth Air Force countered this menace by weaving from side to side while American fighter escorts attacked the rocket-carriers. Another device was the rocket-powered glider-bomb known as the Henschel-293. Ten feet in length, with a wing span of fifteen feet and weighing 2,500 pounds, it had a maximum speed of 300 miles per hour. This glider-bomb was launched by rocket propulsion from a Dornier 217 or a Heinkel 177.

Little information was released regarding Japancse military and transport types in 1943. From Japanese planes taken in the island hopping campaign, however, the AAF gathered information regarding new developments. The Super Zero manufactured by the Mitsubishi Heavy Industries Corporation remained the principal fighter plane. It was much faster, had more climbing capacity, and was able to dive more swiftly than the earlier Zeros. (For details see preceding Year Book.) This plane, however, proved no match for the P-40 Warhawks of the Fourteenth Air Force in China.

Performance of American Combat Aircraft. By the year 1943 it was clear that the performance of American airmen and planes surpassed that of the Axis powers in every theater of operations. The test of battle-the ultimate criterion of performance—showed a box score decidedly in favor of American air forces. This record did not develop simply from American superiority in numbers of planes in combat areas. Although numerical superiortiy was attained in 1943 on most fronts, nevertheless, it was in China, where the United States still had fewer planes than the Japanese, that one of the highest box scores was made.

A report released from the Office of War Information on Oct. 17, 1943, showed that from Dec. 7, 1941, the date of the Japanese attack on Pearl Harbor, to Sept. 1, 1943, American Army combat

nault announced at the headquarters of the Fourteenth Air Force in China that during the thirteen months from July 4, 1942, when the United States took over the American Volunteer Group, to Aug. 4, 1943, the American air force had destroyed 442 Japanese planes and probably an additional 166 planes. The American loss was 51 planes, which made a score of almost nine to one.

The U.S. Navy reports showed that Corsair, Wildcat, and Hellcat fighter planes in 1943 destroyed 884 Japanese warplanes with a loss of only 170 American aircraft. The first ten days of combat in the summer of 1943 in the North Solomon Islands resulted in the destruction of 199 Japanese planes at a cost of 84 American planes. On one day, June 30, 1943, the Japanese lost 101 planes to 14 American planes. The box scores indicated that the vast air force which the United States had built was suited to the global nature of the war, that it was powerful, well balanced and adapted to the strategic and tactical tasks imposed on it.

Jet-Propelled Aircraft. One of the spectacular developments in the year 1943 was the production of fighter airplanes employing jet-propulsion engines

planes flew a total of 223,758 sorties in which they dropped a total of 105,649 tons of bombs. On these missions, the American Army planes destroyed 7,312 enemy planes, including 1,033 destroyed on the ground, and they probably destroyed an additional 2,196 planes, while 2,535 enemy planes were damaged. Of American planes, only 1,867 were destroyed in combat in the air. For the six months ending Sept. I, 1943, American planes destroyed 5,889 enemy planes, probably deplanes destroyed 5,389 enemy planes, probably department of the six months. stroyed an additional 1,502 planes, while damaging 1,860 planes. At the same time, 1,239 American planes were lost in aerial combat.

The box score by plane types showed that among Army planes the heavy bombers had the best record. From January 1 to June 30, 1943, Army heavy bombers destroyed 1,833 Axis planes against a loss of only 316 bombers, a little better than four to one. Army medium bombers during the same period destroyed 113 enemy planes against a loss of 69, almost two to one in favor of American ships. Army fighters shot down 763 enemy planes against a loss of 375 of their own planes, slightly better than two to one. Over Sicily, Sardinia, and Southern Italy, during the four weeks of action ending July 28, 1943, the Eighth and Ninth Air Forces (American) dropped 12,460 tons of bombs and destroyed 342 enemy planes, and probably destroyed 54 in addition, at a cost of 190 American planes.

On Aug. 4, 1943, Maj. Gen. Claire L. Chen-

which eliminated the necessity for propellers. The design was originally British. In 1937, Group Capt. Frank Whittle completed his first successful engine. The Air Ministry placed its primary order for a jetpropelled plane in 1939 with Gloucester Aircraft Company, Ltd., Gloucester, England. The engines were built by Power Jets, Ltd., in a special factory to which Group Captain Whittle was assigned.

The first successful flight of the jet-propelled airplane was in May, 1941, the pilot being Flight Lieut. P. G. Seyers. Full information about the new engine was disclosed, in July, 1941, to the U.S. Army Air Forces. The engine that had made the first flight was then sent to the General Electric Company. With close cooperation between the Army Air Force, the Materiel Command at Wright Field, the Royal Air Force, the Ministry of Aircraft Production, and the General Electric Company, new engines were constructed. The Bell Aircraft Company undertook the task of building an airframe suitable to operate with two of these engines. The first flight in the United States was made in October, 1942, with Robert M. Stanley, Chief Test Pilot of the Bell Aircraft Company, at the controls. This was followed by several hundred successful flights in the United States and by British pilots with British airplanes in England, many of them at high altitudes and extreme speed, such as 500 miles per hour, and all without a single mishap

While the details of the new engine remained a

military secret, the principle of jet-propulsion was well known in engineering circles. By mixing air with explosive gases, the jet-propelled plane was moved by the transfer of momentum or a continuous recoil. Air, taken through the nose of the plane, was compressed, heated, mixed with a fuel and ignited, whereupon it was released at the tail of the plane or the edges of the wings, producing an explosive recoil. Plans were developed to have jet-propelled planes in large scale production in 1944.

For other research, see National Bureau of Standards.

Radar. The year 1943 witnessed further progress in the development of radar (an abbreviation of radio direction and ranging), a radio means of locating and measuring the distance to a target. Night fighter planes were equipped with radar to guide them to enemy bombers. On the other hand, radar became extensively used to control the fire of anti-aircraft guns, and at night largely replaced or supplemented the searchlight. See Physics under Radar.

Gliders. Clider enthusiasts in the United States predicted a brilliant postwar use of this craft for freight and passenger traffic. Several companies made application with the Civil Aeronautics Board for cargo-carrying air service which would utilize gliders towed by aircraft. It was held that they were particularly useful inasmuch as an airplane could thereby drop a load without landing.

For military use, gliders came into mass production in 1943, when over 10,000 had been constructed in the United States. The principal type was the Waco CG4A. It had a wingspan of 84 feet, weighed 8,000 pounds, and carried 15 fully armed troops, two of whom acted as pilot and copilot. The battle for Sicily began on July 9, 1943, when Waco glider-borne troops as well as paratroops landed on the island. In July also occurred the first crossing of the Atlantic by a fully loaded glider. The towing plane was Douglas C-47 transport, the glider, a Waco CG4A. The operating crews came from the Royal Air Force. Leaving Montreal with a maximum load of vaccines for Russia, radio, aircraft, and motor parts, the air train crossed the Atlantic, a distance of 3,500 miles, in twenty-eight hours.

The Helicopter. A considerable number of helicopters, first demonstrated by Ivor Sikorsky in 1942, were constructed for the British and American air forces in 1943. This heavier-than-air craft was capable of hovering in the air without forward movement of moving sideways or backwards, or of landing and taking off vertically. The helicopter used by the Army was YR-4. The airframe was 35 feet long. The rotor was composed of three nineteen-foot blades driven by a 180 h.p. engine. The plane was designed to execute missions over areas where conventional aircraft could not land. The YR-4 was capable of carrying a ton of food, ammunition, or medical supplies.

The Air Transport Command. The air traffic needs of the armed forces of the United States were supplied by: (1) the Troop Carrier Command of the Army Air Force, (2) the Air Transport Command, and (3) the Naval Air Transport Service. The function of the Troop Carrier Command was the tactical delivery of troops and supplies into actual combat zones. The Air Transport Command and the Naval Air Transport Service engaged in a more far-reaching domestic and international transportation of personnel and cargo.

There were three principal tasks for the ATC. Its Ferrying Division delivered to the Allies of

the United States under Lend-Lease agreements. Planes which were ferried were serviced by the Air Service Command in ATC hangars. The Ferrying Division included the Women's Auxiliary Ferrying Squadron (WAFS) which was limited to domestic ferrying operations. (2) In the United States, with the cooperation of commercial airlines under contract to the War Department, the ATC conducted a Transition Transport Training Program, in which Army pilots who were graduates of flying schools maintained by the Flying Training Command were given specialized "transition training" for the operation of various types of transport planes. (3) The ATC served as the agency of the War Department for the aerial transportation of cargo, personnel, and mail both in the United States and overseas. For this purpose, it established and maintained air routes and bases wherever necessary.

Among the routes maintained by the ATC were: (1) the North Atlantic route from the northeastern coast of the United States to the United Kingdom, (2) the route from Miami across the South Atlantic to North Africa, (3) another trans-African route to the Middle East, (4) a route from San Francisco to Hawaii and thence down the chain of Pacific islands to Australia, (5) a route to Alaska, and (6) a route to Latin America. In addition, military air transport in northwestern Canada was largely in the hands of the ATC. The ATC operated fleets of planes over 100,000 miles of transport routes. Many of these routes were extended month by month as the requirements of the fighting front expanded. Over several of the air routes in various quarters of the globe, the ATC established the first regular scheduled air service.

established the first regular scheduled air service. Air cargo for ATC transport was prepared by the Air Service Command, which repacked goods purchased from manufacturers so as to conserve weight and space and marked each package with a color indicating destination which might be in any part of the world from Kiska to Karachi. The Air Service Command also held cargo ready for air transport in warehouses on ATC flying fields.

Much of the service of the ATC was carried on by converted passenger planes taken over from the commercial airlines and by converted bombers. Some of the planes were operated by Army pilots and others by airline personnel who wore the uniform of the ATC. Within the Western Hemisphere, the ATC flew more than one million tons of cargo each week. The amount of cargo flown across the Atlantic and the Pacific was a military secret. Losses in the ATC never rose more than 1 per cent in any month of 1943. Attempts of Japanese air forces to interfere with the Pacific routes of the ATC were unsuccessful.

The principal value of wartime air transport lay not only in the bulk of cargo carried but also in the rapidity with which the planes could complete each mission. Large equipment like light tanks and jeeps were transported across the ocean by air only in cases of emergency. Even in combat zones such objects were seldom carried by planes. Ordinarily, the heaviest freight by air was airplane engines. Speed was the chief goal. A report by the Office of War Information disclosed the fact that in 1943 an ATC plane made a record flight from Australia to California in 33 hours and 27 minutes. Medical supplies and blood plasma, critically needed, were flown to combat zones in the Pacific area with great dispatch. A complete hospital was flown to Alaska in 36 hours.

The Naval Air Transport Service. Parallel to the ATC was the Naval Air Transport Service. The NATS

operated on a smaller scale and without a Ferrying Service. It operated several hundred planes including a number of flying boats over routes aggregating 50,000 miles. The largest of the flying boats was the spectacular Mars (Martin XPB2-MO1) which made its first war mission to Natal in Brazil in December, 1943. Navy transport planes were flown by former airline pilots or by graduates of Naval Aviation schools in transport flying

of Naval Aviation schools in transport flying.

The NATS maintained three basic routes, namely, Atlantic, West Coast, and Pacific divi-sions. The Atlantic Command, with headquarters at Patuxent River in Maryland, consisted of squadrons serving the Atlantic coasts and islands of North and South America. Its planes operated all the way from Argentina in Newfoundland southward to numerous bases in the United States and thence to Guantanamo, San Juan, Antigua, Santa Lucia (Trinidad), Natal, and Rio de Janeiro, and also to Portland Bight (Jamaica) and Coco Solo in the Canal Zone. The Atlantic Command also operated across the Atlantic to Europe and South Africa. The West Command, operating from headquarters at Alameda in California, maintained scheduled flying for the transcontinental service as well as services in Canada and Alaska. Pearl Harbor served as headquarters for the Pacific Command which operated daily services in the Pacific area, chiefly to Australia. In order to coordinate the ATC and the NATS, and to avoid duplication of operations, a joint Army-Navy Air Transport Committee met regularly in Washington.

Domestic Air Carriers. Before Pearl Harbor, 434 airplanes were operated on the commercial airlines of the United States. On Jan. 1, 1943, this number had been reduced to 256, of which 166 were flown within the United States on regular schedules. The other planes had been taken over by the armed services, either outright or to be operated for them by the airlines under contract.

The sharp reduction in the number of airplanes available for commercial use made it necessary to exercise a governmental control over air schedules. No schedule was permitted to continue in operation unless it could be shown to be essential for war transportation. The "service pattern" (the schedule of flights) was strictly regulated by the Civil Aeronautics Board at the request of the Army.

Commercial flying was the only form of passenger travel in 1943 which sold tickets on a priorities basis. Members of the armed forces and government officials traveling on government business came first. The remaining space was sold to other passengers.

In 1943, three all-cargo commercial flights were operated by American airlines on regular schedules. These were: (1) New York to Miami, (2) New York to Salt Lake City, and (3) the Canal Zone to Lima in Peru and thence to Buenos Aires. The latter was the first regular cargo flight under the American flag overseas.

For the fiscal year ending June 30, 1943, domestic air carriers flew 94,889,617 pay-mail miles, and 3,304,411 other revenue miles, making a total of 98,194,058 revenue miles. These carriers transported 2,833,484 revenue passengers a total of 1,734,723,169 revenue passenger miles. The cargo traffic was 56,792,837,525 mail pound-miles, 28,700,642,087 express pound-miles, and 5,670,012,429 excess baggage pound-miles. The revenue from passenger service was \$79,056,748; from express, \$8,472,463; and from excess baggage, \$1,334,265; making a total of \$90,478,833. The mail revenue was \$23,745,870. Operating expenses

were \$82,449,900; while the operating profit was \$31,774,803.

The air carrier safety statistics in scheduled domestic operations for the fiscal year 1943 were as follows: revenue miles flown, 98,194,058; total number of major and minor accidents, 25; total number of fatal accidents, 2; revenue number of miles flown per major and minor accident, 3,927,762; revenue miles flown per fatal accident, 49,097,029; passenger fatalities, 22; pilot fatalities, 2; and crew fatalities other than pilots, 5. In other words, the percentage of passengers fatally injured was 0.0008.

Civil Aeronautics Administration. The Federal Airways System, under the jurisdiction of the Civil Aeronautics Administration in the U.S. Department of Commerce, supervised the operation of 35,000 miles of air routes over which 85 per cent of the traffic was military. With a personnel of 5,120, the CAA airport program in 1943 increased the number of landing fields from 660 to 900. The cost of the establishment and operation of all airways in 1943 was \$33,627,001. There were 270 intermediate fields, 2,206 beacon lights, 97 combined broadcast and radio range stations, and 184 radio range stations. For the fiscal year 1943, the Civil Aeronautics Administration issued approvals for new types of 8 aircraft, 2 engines, 22 propellers, 3 appliances, and 15 special approvals. It also issued approvals for new models of old types of 8 aircraft, 15 engines, 30 propellers, 21 appliances, and 84 special approvals. The CAA inspected 16,882 aircraft for airworthiness certificates and 1,464 flying and ground schools for air agency certificates. It examined 759 airline pilots for original certifi-

cates and 606 airline pilots for instrument rating. In December, 1943, there were 144 ground schools and 295 flight schools in War Training Service. There were 4,875 flight instructors and 1,197 ground instructors, with 18,570 trainees in training. The number of training aircraft was 7,588.

Postwar Air Policy. Increasing attention was centered on postwar air policy. In meeting the needs of military air power, American aviation had become in 1943 a twenty billion dollar industry, employing two and a half million people. This expansion was in sharp contrast to the automobile industry which in its peak year, 1941, produced \$3,700,000,000 worth of cars. While extravagant claims were often made for aviation as a business in the postwar era, it was obvious that the manufacture of aircraft would needs be enormously curtailed.

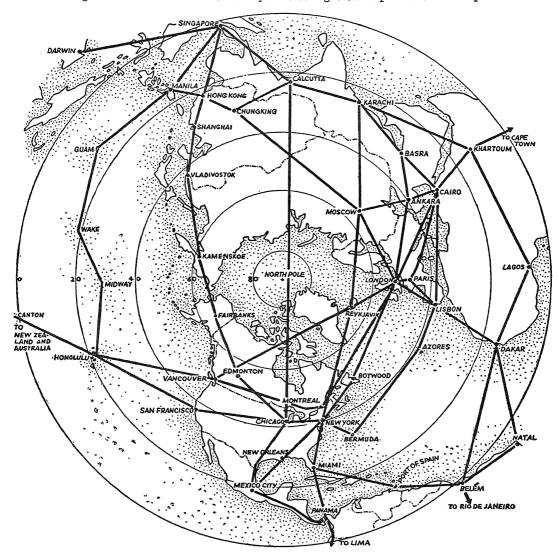

In the international field there was much discussion over the expected competition between the American, British, Dutch, Swedish, Spanish, and Russian airlines and over the need for some international agreement. In the United States, the problem was studied by two governmental agencies, namely, the Civil Aeronautics Board and the Interdepartmental Committee on International Air Policy initiated by the Department of State. At the same time it was widely suggested that the problem of international aviation should be the subject of a special United Nations conference convened before the termination of the war. It was understood that at the Quebec conference in August President Roosevelt and Premier Churchill agreed that an international air conference would be held sometime in the future.

Within the United States, the question of government versus private ownership of airlines in the postwar era was partly answered by General Arnold, who in June informed airline executives

that the Army had no intention of operating the world routes of the Air Transport Command after the war. In October, President Roosevelt stated that he opposed government ownership.

Another problem concerned the "chosen instrument" versus competition by several national or international systems. Long before the war, leading air powers had tended to place international aviation under a national monopoly. The British Government gave the British Overseas Airways

Corporation the exclusive right to operate British airlines overseas. Germany gave a monopoly to the Deutsche Lufthansa; France to Air France; Japan to Dai Nippon; Italy to Ala Littoria and the Netherlands to KLM (Royal Dutch Airways). All aviation in Soviet Russia was a monopoly. By the year 1943, it was clear that all states with great aerial interests, with the exception of the United States, expected to use "chosen instruments" in securing their respective shares in postwar inter-

## INTERNATIONAL AIR ROUTES

Routes shown on this map include prewar, wartime, and possible postwar services. Distances given below are for routes shown on the map, and are approximate; where there are several routes between two points the distance for the shortest is given. All distances are in statute miles.

| New York-London 3,400         | Chicago-Singapore10,000 | London-Cairo 2,200     |

national air traffic. In the United States, proposals were made that the Federal Government adopt the

same policy.

Previous to World War I there had been a tendency on the part of the United States to favor the expansion of the American-owned Pan-American Airways to the exclusion of all other American airlines in the foreign field. In 1940, this tendency was reversed when the Civil Aeronautics Board granted a certificate to the American Export Lines, Inc., to operate a commercial route to Portugal. On July 15, presidents of American airlines, speaking through Samuel Solomon, president of the Northeast Airlines, issued a statement indicating the desire of each of these airlines to enter the overseas transport field. They proposed open competition. The American Export Lines, Inc., proposed regulated competition, while the United Airlines frankly called for the pooling of all American resources in foreign air traffic

resources in foreign air traffic.

The year 1943 witnessed considerable discussion over the problem of freedom of the air. There was apprehension that the Interdepartmental Committee on Aviation expected to pursue a radical policy in promoting freedom of the air. Complete aerial freedom would permit foreign airlines not only to load and unload passengers and freight at American airports but also to carry passengers and cargoes between airports in the United States. In September, L. Welch Pogue, chairman of the Civil Aeronautics Board, proposed an international un-derstanding that would permit all airlines to fly across foreign territory to their commercial outlet in such territory for the discharge of passengers and cargo. In October, the Chamber of Commerce of the United States issued a Statement of Policy on International Transport. The tenth recommendation read: "We favor the establishment by treaty of the right for the commercial planes of all countries to fly over the territory of other countries and to land for fuel, repairs, or emergencies. This right, called the right of commercial transit, does not include the right to discharge or take on passengers or cargo, which right, if granted, should be on the basis of agreement with the governments concerned or procedure established by them." In March, Vice-President Henry A. Wallace advocated a complete internationalization of air systems or a network of globe-circling airways operated by the air arm of the United Nations.

On April 7, the Civil Aeronautics Board authorized five foreign airlines in the Caribbean to fly into Miami. Of these airlines, the KLM and the Aereo Inter-Americano (controlled by American and Cuban interests) established scheduled routes.

AFGHANISTAN. A kingdom in central Asia. Area, about 251,000 square miles; population, variously estimated at 7,000,000 to 12,000,000. Estimated populations of the chief towns: Kabul (capital), 80,000; Kandahar, 60,000 (with suburbs); Herat, 50,000; Mazar-i-Sharif, 30,000. Persian, Pashto, and Turki are the principal languages. All but a few of Turki are the principal languages. All but a few of the inhabitants are Moslems of the Sunni sect. There are some 20,000 mullahs (priests) who wield enormous power, including the administration of justice and a large measure of control over education. Schools in 1941 included 130 primary, 4 secondary, and 3 military schools. Kabul University, established in 1932, has medical, chemical, and law faculties. There are a few other technical, art, commercial, and medical colleges.

Defense. One-eighth of the male population of each city and village must serve two years in the army and eight years in the reserve. There is also a regular army recruited by life-long enlistment. The normal peace strength of the army is 90,000 men, including the small air force of 800 men with some European-trained pilots. Numerous tribesmen armed with modern rifles are available for service

in time of war.

Production. Agriculture and stock raising are the chief occupations, the main products being cereals fruits, vegetables, cotton, wool, hides and skins, and meat from the native fat-tailed sheep. The mineral resources include iron, copper, lead, gold, silver, lapis lazuli, coal, and petroleum, but there is little production. There are state-owned factories at Kabul, Kandahar, and elsewhere for the manufacture of arms, ammunition, boots, military clothing, furniture, matches, buttons, leather, soap, cotton goods, and wool products. The total national income is estimated at 250,000,000 afghanis.

Foreign Trade. Commerce is mainly with India,

the Soviet Union, and Iran. The chief exports are fruits, nuts, timber, spices, cotton carpets, wool, and skins. Imports in 1938 were valued at 172,000,000 afghanis and exports at 140,000,000 (4 afghanis equalled 1 rupee, or \$0.30). Cotton textiles. machinery, gasoline, kerosene, sugar, automotive equipment, and tea are the main imports.

Communications. Afghanistan has no railways and practically no navigable rivers. Four thousand miles of roads are suitable for motor transport in dry weather, and trucks are increasingly replacing pack animals as the chief means of transportation. An allweather motor highway from Kabul to Peshawar, India, by a shorter and lower route was scheduled for completion in 1942. The other chief trade route to India is from Kandahar to the Indian railhead at Chaman. A 500-mile motor route from Stalinabad, Soviet Turkestan, was completed to Khorog on the Afghan border in 1941. There are telephones in most of the larger towns, telegraph lines connecting the cities, and five radio-broadcasting stations.

Government. Under the Constitution of Oct. 31, 1931, Afghanistan is a constitutional monarchy, with legislative power vested in the King, a senate of 43 members nominated for life, and a national assembly of 110 elected members. Actually the state consists of a loose confederation of warlike tribes under the patriarchal rule of the family controlling the government at Kabul. When the ruler dies or is driven out or assassinated, the commander of the Kabul garrison usually succeeds to the throne. Through the influence of his uncle, Shah Mahmud, the Minister of War, Mohammed Zahir Shah succeeded to the throne upon the assassina-tion of his father, Mohammed Nadir Shah, in 1933. Mohammed Hashim Khan, another uncle of the King and the head of the ruling family, became Prime Minister and the real power behind the throne. The tribes are kept under control by the hostage system and the combined use of force, bribery, and diplomacy.

History. Herbert L. Matthews, a correspondent of The New York Times, visited Kabul from India in May, 1943, and sent out the first comprehensive account of conditions in Afghanistan that had been published for some years. He reported that the Afghan Government was holding firmly to its policy of neutrality. In cooperation with British authorities in the Northwest Frontier Province of India, it succeeded in maintaining peace among the turbulent tribes of the Afghan-Indian border, despite intrigues of the German, Italian, and Japanese diplomatic corps that remained in the country after the Afghan Government expelled nonofficial Axis nationals in 1941. According to Matthews, Afghan officials viewed the Anglo-Soviet occupation of Iran with apprehension. In both foreign and domestic policy they followed the lead of Turkey, seeking to modernize and westernize the country as rapidly as their scanty means and the powerful opposition of the mullahs would permit. However the war-like character of the border tribes and their inbred hostility to the British made it impossible for the Kabul authorities to adopt an openly pro-British attitude.

In Kabul Matthews found an American colony of 14 persons, of whom 10 were connected with the U.S. legation established in July, 1942, under a career diplomat, Cornelius Van H. Engert The first Afghan Minister to the United States presented his credentials to President Roosevelt June 4, 1943. According to the Times correspondent, the American legation officials had a friendly reception in Afghanistan and had won favor by the gift of a jeep to the Minister of War and of a training plane to the small Afghan air force. Delivery of American trucks and spare parts also was promised. Effective October 13, the Afghan Government fixed the exchange rate for the U.S. dollar at 11.5528 afghanis (instead of 13.0472 afghanis).

AFRICA. A continent of the eastern hemisphere. Area, about 11,710,000 square miles (30,330,000 square kilometers) Population (Jan. 1, 1940, estimate), 157,330,000. See the separate articles on its countries and territories, such as ALGERIA, EGYPT, ETHIOPIA, KENYA, MOROCCO, SOUTH AFRICA, UNION OF; TUNISIA. Also see WORLD WAR.

AGRICULTURAL AGENCIES. For various government agencies listed under "Agricultural" see ACRICULTURE, U.S. DEPARTMENT OF. Also see WAR FOOD Administration.

AGRICULTURAL COOPERATION. During 1943 farmer cooperative associations in the United States made outstanding contributions to the successful prosecution of the war. Their millions of farmer members were enabled to increase food production, market crops economically, process huge volumes of foods for the tremendous military and other Government requirements, and conserve scarce

transportation facilities.

All told, there are between 15,000 and 20,000 farmer-owned and farmer-controlled cooperative associations and mutual companies now operating in this country. Of this number, 10,450 are engaged primarily in marketing farm products, purchasing farm supplies, or performing related services. Mutual irrigation companies number approximately 2,500 and farmers' mutual fire insurance companies number about 1,900. In addition there are approximately 800 rural electric cooperatives and a larger number of farmer-owned telephone companies. Nearly a third of all the telephones now in use in American farm homes are provided by the farmers' own mutual companies. This service is furnished through more than 2,000 operating companies with switchboards and some 30,000 connecting lines. About 100 agricultural credit corporations associated with various types of cooperative organizations provide a discount service. Many of these are subsidiaries of operating associations.

Other activities performed by some cooperatives for their members include highway transportation, repairs, inspection, burial services, and services in cooperative rural hospitals and by cooperative

health associations.

In addition there are many so-called "cooperative production activities" by farmers in connection with farm land and the production of crops and animals. Since much of this cooperation, however, is informal and not reported, any statistical evaluation of it is incomplete. Among such producer cooperatives are associations for carrying out soil conservation programs, such as terracing and drainage projects, associations for producing better strains of seed and insuring the production of high quality seed in quantity, associations for improving breeds of animals, and associations for solving cultural and harvesting problems. It is estimated that there are approximately 1,000 dairy herd improvement associations, 300 dairy-bull associations, 100 dairy-cattle artificial-breeding associations, 40 grazing associations, and 200 Indian cooperatives largely concerned with production problems. During the marketing season 1942-43, farmers increased their membership in their own cooperative marketing and purchasing associations to an estimated total of 3,850,000. In addition, it is estimated that at least one-half million more farmers patronize them without accepting the responsibilities of membership. The cooperatives transacted an estimated dollar value of business amounting to \$3,780,000,000. This record-breaking total exceeded the business of the preceding year by \$940,000,000, practically a "billion-dollar increase" that was due in part to increased production and in part to higher price

The following table shows the number of marketing associations in specified groups, and the number of purchasing associations, with estimated membership and dollar business for the 1942-43 marketing season:

FARMERS' MARKETING AND PURCHASING CO-OPERATIVES, 1942–43 MARKETING SEASON

| Group   | Associations                           | Estimated<br>members  | Estimated business   |

By the close of 1943 at least 14 cooperative organizations were engaged in dehydrating fruits and vegetables. By dehydration not only are space, weight, and packaging materials saved in shipping, but foods are preserved with a minimum of spoilage. An outstanding contribution was made by the large cranberry canning cooperative, which more than doubled its dehydrating facilities to supply the Government in 1943 with two million pounds of the dehydrated product, which is over 90 per cent of the national total. With the tremendous growth in recent years in the production of dairy products by cooperatives, this group has been in the forefront of the expansion in dry milk produc-

Another important field in which several cooperatives are taking a leading part is that of citrus concentrates. Along with this, these cooperatives have increased production of dried pulp feed and citrus molasses, which have been highly advanta-

geous to the dairy industry.

The number of frozen food locker plants in the United States was increased in 1943 as rapidly as the War Production Board was able to approve priorities for materials for construction. By the end of 1943 between 5,300 and 5,500 were in operation. Farmers, it was estimated, were using about 75 per cent of this locker capacity. Over one-fifth of all farm families in the United States are now using lockers. One of the objectives of the Government in providing materials for both cooperative associations and private business concerns to establish such plants is to provide facilities for the preservation of locally grown foods which otherwise might be wasted or spoiled. Such plants also contribute to the food conservation program by savings in transportation and in metals and other critical materials.

For a more detailed discussion, see 1943 YEAR Book.

W. W. Fetrow.

AGRICULTURE. Crop production in the United States in 1943 was 6 per cent less than in 1942 but nearly 5 per cent more than in any previous season. In comparison with the average of the five moderately favorable crop seasons, 1937-41, the

acreage of the principal crops harvested was up 4½ per cent; yields per acre were up an average of 5 per cent and aggregate production of the 53 principal crops, including fruits, was up 9 per cent. Part of this 9 per cent increase over the fiveyear average was due to a slightly better than average growing season; to progressive improve-ment in farming practices, to changes in the Agricultural Adjustment program, to deferment of farm workers, and to prices and programs which encouraged farmers to buy more fertilizers and improved seed and plant larger acreages. Although these conditions helped to make the increase possible, producers faced shortages of skilled men, of supplies, and equipment, and vexatious delays from wet weather and floods.

Much of the credit for the increase must be given to the united efforts of farmers to push production toward the limits fixed by acres of land, hours of daylight, and human endurance. Farmers and their families worked more hours per week and more Sundays than in any year known to this generation. Much of the extra help available was unskilled, but farm operators worked more efficiently than ever before. Town people helped where they could. Imported workers, pris-oners of war, soldiers on furlough, and city volunteers helped. Shortages of equipment, parts, gasoline, tires, and packages threatened breakdowns at times, but in the main, the tractors, harvesting machines, and trucks were kept rolling.

Production in 1943. The estimates for 1943 show record production of potatoes, beans, peas, soybeans, peanuts, rice, and various minor crops, including nuts, hemp, and some commercial vegetables, particularly snap beans, carrots, and let-tuce. The orange crop on the trees was very promising and with average weather the production of oranges and of all citrus fruits as a group seemed likely to exceed past records. Crops or groups of crops which have been exceeded only a few times in past years include corn, barley, sorghums for grain, all grains as a group, all hay crops combined, and vegetables for processing. The list of crops that were not far from usual production, excluding drought seasons, included wheat, oats, tobacco, sweet potatoes, and various less important crops such as maple sirup, prunes, and cranberries.

Buckwheat was substituted for some oats that could not be planted in season and production of buckwheat was larger than in other years since 1934 but far below production in earlier decades. Sugar production was a little below average. While sugarcane for sugar showed the second highest production on record, the tonnage of sugar beets was lower than in any year since 1922. The cotton crop was smaller than usual but there was no shortage of supplies. About the only other crops that were materially below average in production were the deciduous fruits (apples, peaches, pears, apricots, and cherries) reduced chiefly by late frosts in the eastern half of the country, some seed crops affected by the weather, and rye and cowpeas which were extensively displaced by crops more in demand because of the war.

Much effort to increase food production was devoted to livestock; and the production of livestock and livestock products was exceptionally heavy. Aggregate production of sheep, cattle, hogs, poultry, eggs, and milk ran about 8 per cent above production in 1942, 31 per cent above production during the 1937–41 period, and more than 31 per cent higher than in any earlier year. Though the production of lamb and mutton was somewhat

smaller than in 1942, the production of beef and veal exceeded the 1942 total by 3 per cent or thereabouts, and the production of pork was 23

per cent higher.

Chicken production was near the record total of 4 billion pounds, and egg production probably exceeded 5 billion dozen. Production of milk for human consumption was nearly as large as in 1942, though increased use of milk in the fluid form entailed a drop of possibly 13 per cent in the production of cheese and evaporated milk. Ice cream production was down about 20 per cent from 1942, but butter production was up a little.

Livestock production had specially favoring circumstances; in fact an equally favorable combination happens rarely. After the drought years of the early 1930's, we had good crops from 1937 through 1941, and these laid the foundation for a progressive increase in numbers of cattle, hogs, sheep, and poultry. Range grass recovered and stocks of feed accumulated. The unprecedented harvest of 1942 added greatly to the accumulated feed supply. Production of grain in 1942 totaled 156 million tons—twice the production in the drought year 1934 and equal to one-fourth of the quantity usually produced in the whole world. Total crop production was 12 per cent greater than in any previous year. In consequence our stocks of grain, the highest in 20 years, increased in every State, and set the stage for maximum livestock production, the demand for which was meantime rising fast.

Farmers began 1943 with record numbers of livestock, record supplies of grain and hay, and record conditions. Prices of livestock were high and rising; the inventory values of cattle, hogs, and chickens on farms averaged the highest since

the Civil War.

Farmers saved 74,050,000 spring pigs, or 22 per cent above the number saved in 1942 and 37 per cent above the number in any previous year. They appeared to be saving about 21 per cent more fall pigs than in 1942. In fact, the 88 million logs that will be on farms January 1 will overtax the feed supply.

Milk production was slightly below the record output of 1942, but about 3 per cent greater than in any previous season; moreover, an increased proportion of it reached the market as whole milk. Production of sheep and lambs, though some 8 per cent below the 2,313 million pounds produced in 1942, should exceed the output for any year

prior to 1941.

In the early spring, crop prospects seemed favorable because the western half of the country had an excellent supply of subsoil moisture and of water for irrigation. Then late frosts began to reduce prospects for fruits and early vegetables. May brought tremendous rains and floods from Oklahoma to Michigan, and continuously wet weather over a wide area. This delayed farm work, particularly the planting of corn and soybeans, but brought about a heavy growth of hay crops. June brought more floods in the lower Missouri Valley but also brought good rains in the spring wheat States and enough dry weather east of the Mississippi to permit farmers in most areas to catch up with late planting and haying. July and August were mostly hot and dry; pastures and most late crops suffered and severe droughts developed in two areas—one centering in Arkansas and extending into surrounding States and the other extending from New Jersey into Virginia.

The acreage of crops harvested in 1943 was

about 347,500,000 and exceeded that harvested in 1942 by more than 9 million acres or nearly 3 per cent. The increase was accomplished under difficulties, for wet weather prevented planting some acreage, not all of the acreage destroyed by the floods could be replanted, and there were some losses from drought. The total area of crops lost was about 13,500,000 acres, nearly 2,000,000 more than in 1942, slightly more than in 1941, but substantially less than in any of the years from 1933 through 1940.

ACREAGE AND PRODUCTION OF FARM CROPS IN THE UNITED STATES IN 1942 AND 1943 (Bushels except as otherwise indicated)

1 lb. 2 bales. 3 tons. 4 100-lb. bags. 5 gallons. 5 trees tapped.

Fruit production in the season of 1943 (including citrus fruits for the harvesting season of 1943–44) was the smallest since 1938, and 12 per cent smaller than the record-high of 1942. Yield per acre of 10 major fruits was 11 per cent below that of 1942, but a fourth larger than the 1923–32 average. Combined production of four tree nuts (walnuts, pecans, almonds, and filberts) was slightly above the previous high-record year of 1941 and 14 per cent larger than in 1942.

Crops of apples, peaches, pears, cherries, apricots, and strawberries were exceptionally small. Winter and spring injury by freezes and unfavorable weather during pollination were largely responsible. Partially offsetting these small crops

were the largest crop of grapes on record, large crops of plums, prunes, and figs, and a record-high prospective tonnage of citrus fruits. Production of oranges for the 1943–44 season was the largest of record. The grapefruit outlook was for a crop second only to the record crop of 1942, and lemon production promised to be the third largest

crop of record.

Tonnage of important commercial truck crops, for marketing fresh and for processing, was about 10 per cent less than in 1942, but was greater than for any previous year except 1941. Both fresh market and processing crops showed substantial reductions from 1942. Aggregate production of 6,508,000 tons for the fresh market in 1943, while less than for any year since 1937, was only 7 per cent less than the 7,013,000 tons for 1942, and was about 4 per cent greater than the 10-year (1932–41) average of 6,275,000 tons. Tonnage of 11 crops for processing in 1943 was 4,981,000 tons—14 per cent less than in 1942, but 50 per cent above the 1932–41 average and higher than for any other year except 1941. The reduction from 1942 was offset partially by vegetable production in Victory gardens.

Production of the six principal grass and clover seeds was about 405,000,000 pounds, the lowest since 1937, but much above all earlier years except 1935. The 1943 crops of alfalfa seed and red clover seed were larger than in 1942 while alsike clover, sweetclover, lespedeza, and timothy were smaller. The sweet clover seed crop was particularly small compared to recent years. Because of restricted imports, increased domestic needs, and demand for export under Lend-Lease, prices of these crops have been relatively favorable, and the acreage saved for seed has been relatively

high in recent years.

Crop yields in 1943 were mostly lower than in 1942 but averaged a little higher than in any of the years 1937–41 and much higher than in earlier years. Of all principal crops except vegetables, the aggregate yields were 124 per cent of the 1923–32 (predrought) average, compared with 136 per cent in 1942 and 114 to 122 per cent in the previous five years. Potatoes gave an average yield of 140 bushels per acre, the highest recorded. Corn yielded 32.5 bushels per acre and spring wheat 18.5 above the yields in years previous to 1942. Cotton, tame hay, soybeans, and tobacco yields were exceeded only in 1942 and a few other years. Yields of many other crops were in line with the general upward trend.

Feed crop production in 1943 showed a large total, but was not evenly distributed geographically and was not large in proportion to the numbers of livestock and poultry on the farms. Production of the four feed grains totaled 115 million tons, a quantity exceeded only in 1942 and 1920. The supply per unit of livestock on hand, though less than in any other year since the drought was not far from the average during earlier decades. It will suffice for normal feeding if closely utilized. The hay crop was the second largest produced, and was sufficient for normal feeding per unit of

livestock.

The corn crop, which was the second largest on record, totaled 3,076,159,000 bushels, and the acreage planted to corn was the largest since 1937, despite generally adverse weather at planting time. (See Corn.) The estimated production of all wheat in 1943 was 836,298,000 bushels, 14 per cent less than the 1942 crop but 13 per cent greater than the 10-year (1932-41) average; the yield per acre of 16.5 bushels was 22 per cent

above the 10-year average. (See Wheat.) The 1,143,867,000 bushels of oats produced was 12 per cent more than the 10-year average, 1932 to 1941, though 15 per cent below last year's bumper crop. (See Oats.) The 1943 barley production of 322,187,000 bushels was one-fourth less than the record crop produced last year but almost a third larger than the 10-year average. (See Barley.) The acreage of rye harvested for grain was below that of any year since 1936, 16 per cent below the 10-year average. Rye could not meet the competition of more profitable war crops. (See Rye.)

The production of buckwheat, estimated at 8,830,000 bushels, is substantially above average, and is the largest since 1934. Production in 1942 was 6,636,000 bushels, and the 10-year (1932–41) average is 7,029,000 bushels. The largest acreage since 1931 was planted, and a total of 505,000 acres was harvested—well above the 375,000 acres harvested in 1942, and the 10-year average of 424,000 acres. The acreage expansion was due for the most part to the late wet spring which to some extent prevented planting the intended acre-

age of the usual feed crops.

Flasseed production, over 52 million bushels, was 11 million bushels larger than the 1942 record crop. (See Flasseed.) Flax fiber production of 20,000 tons was only about half as large as the 1942 crop of 37,000 tons. All of the tonnage was produced in Oregon. A sharp reduction in both acreage planted and yield per acre is responsible for the small crop. Production of 70,025,000 bushels of rice also exceeded the previous record set in 1942, by about 8 per cent, and was about 48 per cent above average. (See Rice.)

A crop of 103,168,000 bushels of sorghums for grain and seed was harvested, from 6,637,000 acres of sorghums of all kinds grown in 1943. This production was slightly less than in 1942, but about 68 per cent above the average. While acreage harvested for grain was larger than in 1942, yields were much lower. All sorghums for silage amounted to 5,011,000 tons from 954,000 acres, compared with 6,677,000 tons in 1942 and the average of 3,921,000 tons from 8,414,000 acres, considerably below the 13,564,000 tons in 1942, but slightly above average forage production. The 1943 hay crop of nearly 100 million tons was the second largest on record and only 5 per cent smaller than the record 1942 crop. (See Hax.)

A record crop of dry field peas was produced in 1943. Production was about 10,870,000 bags (100 lb. uncleaned), or 47 per cent above the 1942 crop of 7,408,000 bags and more than four times the 10-year (1932–41) average of 2,617,000 bags. Included in the estimate are seed peas and peas planted specifically for food and canning peas which were allowed to mature; Austrian Winter peas are not included. The increase in production is due largely to a greater war need for this important food crop. The acreage was increased greatly in the Pacific Northwest, where most of the crop is produced. The yield per acre of 1,367 pounds was not as good as that obtained in 1942, because of poorer growing weather early in the season, a shorter growing season in some areas and a shift to lower yielding varieties in others.

and a shift to lower yielding varieties in others. The 1943 crop of dry edible beans was the largest of record. Estimated production of 21,799,000 bags (of 100 pounds each, uncleaned), was nearly 15 per cent more than the 1942 crop and about 52 per cent more than the 10-year (1932–41) average of 14,325,000 bags. Production has been increasing gradually since 1934, but

the increase compared with 1942 was largely the response to greater war needs. The production of soybeans (q.v.), at 195,762,000 bushels, was 5 per cent larger than the revised estimate for the

1942 crop of 187,155,000 bushels.

Production of 2,561,610,000 pounds of peanuts was estimated from the acreage picked and threshed. Though somewhat lower than early estimates, the production was the largest of record and exceeded the previous record (1942 crop) by about 16 per cent. Acreages well above those of 1942 were planted to peanuts in each of the three important areas. Growing conditions were good in the Southeastern area and harvesting of the large crop was completed without serious difficulty. The crop was of high quality.

Post-harvest acreage and yield surveys pointed to a 1943 tobacco crop of 1,403,275,000 pounds. (See Tobacco.) Mainly as a result of severe drought, the Maryland tobacco crop was the

smallest on record.

The cotton crop was estimated at 11.5 million bales on 21.9 million harvested acres. The acreage harvested was smaller than in any other year during the present century. Early season prospects

were for an all-time record yield for the United States, but excessive drought during August and early September resulted in considerable deteriora-tion of the crop, especially in Tennessee, Arkansas, Oklahoma, and Texas. Some further reduction occurred in the northern fringe of the Cotton Belt as the result of killing frosts during mid-October. Production of cottonseed was calculated at 5.1 million tons, compared with 5.7 million tons produced in 1942. If the percentage of the 1943 cottonseed crop delivered to oil mills is comparable to that for the 1943 crop, production of crude oil from this source should amount to about 1¼ billion pounds. Cottonseed is one of the most important sources of greatly needed vegetable oil. (See Cotton.)

Preliminary reports from sugar beet factories indicated production of 6,516,000 tons in 1943. This total would be about 44 per cent less than the near-record crop produced last year, and the smallest tonnage produced since 1922. Contributing to the decrease were such factors as unfavorable weather at planting time, uncertainty as to the labor situation, discouragement brought about by the difficulties that were experienced in har-

Exclusive of Government payments. 52 principal crops. 5% gain over 1942.

vesting the 1942 crop, and keen competition from other crops requiring less hand labor. The production of sugarcane sirup of 19,240,000 gallons is somewhat more than was produced in either of the past two years. The ill effects of dry weather in some sections during the growing season were largely offset by a mild late fall. Sorgo sirup production on the other hand, at 11,760,000 gallons, is about 2,000,000 gallons below the production of last year and only 81 per cent of the 10-year average. In 1942 sorgo for sirup was grown on 8,000 acres for conversion into industrial alcohol. The production of sugarcane to be used for sugar and seed is estimated at 6,904,000 tons—about 18 per cent more than last year's crop. About 93 per cent of this cane is expected to be used in the production of approximately 554,000 tons of 96° raw sugar.

On a harvested acreage 23 per cent greater than that of 1942, production of potatoes in 1943 turned out to be the largest of record. (See Potatoes.) The 1943 sweet potato crop of 72,572,000 bushels was 11 per cent greater than the 65,508,000 bushel crop of 1942 and 5 per cent above the 10-year (1932–41) average of 69,291,000 bushels. The acreage harvested was 25 per cent greater than in 1942 and 7 per cent above the average, but lower per-acre yields partially offset the increase in acreage. Practically all of the increase in production over 1942 came in the South Central States, with Louisiana, Texas, Alabama, and Tennessee leading the way.

Victory Garden Program. The call for Victory Gardens in 1943 met with a hearty response the country over. People took seriously the request that they should produce garden stuff for home use and thereby release food for our armed forces and our allies. The goal of 18,000,000 Victory Gardens set for 1943 was exceeded by at least 2,000,000. Victory Gardens dotted the American landscape on farms, in rural towns, in back yards, and on vacant lots in all our cities. Moreover, Victory gardeners by and large were successful.

tory gardeners by and large were successful. It is estimated that the Victory Gardens produced something like 8 million tons of food in 1943. Pantry and storage shelves in many farm, town, and city homes are full of home-canned tomatoes, string beans, peas, corn, and other vegetables yielded by the Victory Gardens. Something like 7½ million farm and rural families produced and preserved the major part of their winter supply of vegetables and fruits, and many urban families did considerable home canning and preserving. For the 4-H clubs, the Victory Gardens were one of the most important projects of the year. These clubs did great service in caring for such gardens and helped to produce much of the family food supply.

Farm Earnings. Farmers' income from 1943 marketings may run above 19 billion dollars, as compared with \$15,500,000,000 in 1942. The 1942 figure was more than one-third greater than that of the previous year, and with Government payments made a cash farm income of \$16,200,000,000. The corresponding prewar average (1935–39) was \$8,500,000,000. Farm costs have risen, but not as much as the farm income. Realized net income of farm operators in 1943 will probably amount to about \$12,600,000,000, as compared with \$9,500,000,000 in 1942 and \$6,300,000,000 in 1941. Current prices encourage most farmers to use all their available resources, though it does not follow that prices for all farm commodities are necessarily satisfactory. Some prices may be too high and others too low to get the best result

in terms of war production. From the standpoint of the farm income, however, the position is exceptionally favorable.

The income of persons on farms has improved in relation to that of persons not on farms. At the outbreak of the war, the income per capita of persons on farms was below the prewar (1910–14) parity. Production and marketings of farm products have since increased greatly, and the demand has been such as to raise prices with the increase in production, as in the World War I period. In 1939 the receipts from marketings, with the addition of Government payments, raised the per capita income to persons on farms to only 94 per cent of parity with the nonfarm income of persons not on farms. By 1941 the farm income from marketings plus Government payments exceeded parity. Including Government payments, the income per person on farms in 1942 amounted to 138 per cent of parity, which compares with nearly 147 per cent in 1917 and 165 per cent in 1918

Forecasting farm income with any precision for the duration is impracticable, since no one knows how long the war will last. The Department ex-pects that the current upward trend will continue into 1944. Farm production, however, may show only a moderate over-all increase, and prices will be increasingly subject to ceilings. Moreover, farm prices in 1943 have averaged almost 80 per cent above the average for the five years 1935–39 and must consequently be expected to rise less hereafter. With lower rates of increase in view for both production and prices, the farm income must show a corresponding trend, though some further additions to farmers' income may result from the operation of purchase-and-sale programs or their equivalent. Average net money incomes of farm families have increased rapidly since the out-break of the war, and the increase will probably continue into 1944, more strongly in the lower and median income groups than in the top groups. Though farm income may not be much higher when the war stops than it is now, it will be high and will enable farmers to set aside reserves and to finance much of their operating expense without borrowing.

Wartime Price Control. The United States price stabilization program started from mere "price watching" in 1940, grew into selective or limited price control, and then widened into a comprehensive many-sided policy designed to brace the whole economy against wartime strains and stresses. The short term for it is "inflation control."

Stage by stage, from the price-watching period, the program added new elements and new techniques, notably rationing as the counterpart of price control and wage and salary stabilization as protection against inflationary spiraling. Actual price control began in 1941 with price-freezing orders on metals and other industrial products. Quickly the control broadened. Under the Emergency Price Control Act, under which regulations were in effect from Jan. 30, 1942, to Oct. 2, 1942, most nonagricultural products became subject to ceiling prices, and also about 40 per cent of the farm products.

In this period, however, the Emergency Act forbade OPA to set ceilings on processed or unprocessed agricultural commodities below a point which would return to farmers the highest of these four prices: 110 per cent of parity; the market price on Oct. 1, 1941; the market price on Dec. 15, 1941; or the average price from July 1, 1919, to June 30, 1929. Under this arrange-

ment the prices of uncontrolled foods advanced considerably

Accordingly, in October, 1942, Congress amended the price-control legislation. The new measure (Public, 729, approved Oct. 2, 1942) directed the President, through any Government agency, to stabilize prices, wages, and salaries. Under certain conditions, for example, to meet rising labor costs or other expenses of production, the law authorized modifications in farm prices. An Executive order dated Oct. 5, 1942, extended price control to about 90 per cent of our food at

From the Agricultural Outlook, December, 1943

the retail level, though it still left out important seasonal products such as most fresh fruits and vegetables. See Price Administration; also WPB.

The anti-inflation program gained strength also from other nation-wide procedures. On Apr. 8, 1943, the President issued his "Hold the Line" Executive order. In line with this order, the Office of Price Administration and the Reconstruction Finance Corporation worked out, and since June and early July, have operated a program which reduced the retail prices of butter and the chief cuts of pork, beef, and lamb. Under this program the prices at retail of the commodities mentioned have been reduced about 10 per cent. Payments equivalent to this reduction have been made to processors from the funds of the Reconstruction Finance Corporation, so that prices to producers can be maintained at the original level.

Live hogs and apples were brought under ceilings. Also, the general outlines and key prices for ceiling or control regulations for beef cattle and winter fresh vegetables were announced. In addition the War Food Administrator has worked out a program of payments to fluid milk and butterfat producers in order to cover increased costs of dairy feed to dairymen without affecting the price of milk and other dairy products at retail. Altogether, the price of almost every important food product is now subject to ceiling regulation, at the farm level as well as the retail level for a considerable number of commodities.

In short the Government in some cases is indemnifying processors and distributors for losses incurred or anticipated through lack of agree-ment between farm and ceiling prices, and in other cases is encouraging additional farm production at no extra cost to the consumer. This type of

action is a keystone in the price-stabilization arch. Commodity Credit Operations. In order to maintain

price stability, the Commodity Credit Corporation purchases the entire production of some crops. It controls the entire production of soybeans. Marked expansion in the output calls for the fullest possible utilization of the available crushing facilities, the relatively inefficient as well as the efficient. Moreover, large quantities of soybeans must be moved from the main soybean area to other localities that have facilities for crushing soybeans, when they are not in use for crushing cottonseed and other crops. It would be extravagant to provide margins for all processors on exactly the same basis. Margins necessary to cover crushing costs in the improvised plants or in areas distant from the main production areas would be excessive for the efficient favorably located plants and would involve excessively high prices for the oil and meal.

The CCC takes over the entire soybean crop because otherwise it would not be possible to establish reasonable processing differentials. Similar principles apply to the handling of the peanut crop. As a result, soybean and peanut producers receive agreed prices, processors have assurance that they will be able to cover their costs and make a profit, and users of the oil-crop products

obtain supplies at reasonable prices.

In the handling of canning crops the operations of the CCC enable producers to get support prices and consumers to have ceiling prices lower than would be necessary otherwise. These opera-tions result in some losses to the CCC. The production required is very large, and much of it goes to the armed forces and to our allies. Absorption by the CCC of part of the squeeze be-tween the support prices and the ceiling prices reflects official recognition of the fact that the extra cost of getting sufficient production of the canning crops is to some extent a war cost and should not fall exclusively on the consumer. The same principle applies to sugar beets. In order to maintain the sugar-beet acreage, CCC is paying prices that are in excess of the present ceiling prices. It absorbs a loss on possibly one-seventh of the total production, and in this way prevents a rise in the price to consumers on the remaining six-sevenths as well.

Electrification of Farms. The importance of the nation's rural electric power lines to the production of its food has been recognized. Prior to Pearl Harbor the Rural Electrification Administration had been vigorously extending central station electricity to rural regions. During the fiscal year of 1941, for example, its borrowers built and energized 75,000 miles of line and brought power to

225.000 users.

Then, even before the advent of war, came a period of stock taking and of appraisal. The nation's raw materials, its copper and steel, had to be conserved. Each undertaking that claimed the use of war materials had to be examined from a consideration of national service. Therefore, in July, 1942, construction of 32 REA-financed systems which had been begun before the war was ordered halted. Only the most urgent line extensions were permitted.

In January, 1943, the War Production Board specifically recognized the importance of electricity on the farm. It issued a new ruling which permitted line extensions up to 5,000 feet to farms which had or were producing a minimum of 10 "animal units" and at least 1 unit for each 100 feet of line. (An "animal unit," for the purpose of the WPB ruling, is 1 milk cow, or 30 breeding ewes, or 3 brood sows, or 160 lambs per year in feed lot, and so on.) Each farm, before it could be connected to a power line, needed to have or be able to get without priority such electrical farm equipment as a water pump, pig or chicken brooder, motor, feed grinder, or milker.

Two months later, in March, 1943, WPB modified this order, having the minimum number of food animal units required to complete service extensions. In April, 1943, WPB issued an order to complete some of the REA-financed systems whose construction had been halted the previous July. As a result of these rulings, during the fiscal year 1943 about 60,000 members were added to the REA-financed systems.

Resources of Small Farms. Small farms such as those operated by Farm Security Administration borrowers have important resources for expanded agricultural production. The one-third of the nation's farms which produce 84 per cent of the agricultural commodities that go to market will continue to be the source of most of the total commercial food production. These farms, however, are already producing at near capacity. Families on the FSA program, on the other hand, have not reached their peak production, and generally they have no shortage of labor. The small farmer finds he can milk 8 cows instead of 2 with family labor already available. He can keep 20 pigs instead of 10. As the demand increases for additional food supplies for the armed forces and shipment overseas, the nation will depend more and more on the smaller farms.

Operating loans for the purchase of livestock, equipment, and other farming essentials were made during the fiscal year to 51,015 families who had not previously been on the FSA program, and supplemental loans were made to 198,705 already on the program. A total of \$97,255,090 was

advanced in loans from rehabilitation funds.

The collection record in the fiscal year 1943 was the best in the history of the FSA. From the beginning of the program to June 30, 1943, nearly one million families had borrowed \$778,522,696 in rehabilitation funds, and of this amount \$404,-327,655 had come due. Of the total maturities 88 per cent on these supposedly "high-risk" loans had been repaid, and enough advance payments had been received to bring collections up to 93 per cent of the maturities. In addition, \$49,085,-380 had been paid in interest. More than 260,000 families had repaid their debts completely. They were on their feet again as independent operators and drawing their credit from commercial sources.

For the fiscal year 1942–43 collections totaled \$128,720,775, or nearly a third more than the total amount of the \$97,255,090 which had been

loaned during the year.

The borrowers' prompt repayments to the FSA are reflected in the record of repayments made by the FSA to the Reconstruction Finance Corporation. From July 1, 1940, when RFC funds were first used for rural rehabilitation loans, through June 30, 1943, the FSA had borrowed a total of \$332,315,000 from the RFC, and had paid back \$271,759,029 in principal and interest. The balance of approximately 62,000,000 still owed to the RFC on the past year's obligation is secured by borrowers' notes totaling approximately \$416,000,-000, a ratio of more than 6 to 1.

Selective Crop Expansion. Our huge increase in food production since 1939 is the result, not of uniform, but of selective crop expansion developed farm by farm through careful thought and ad-

vance planning. It represents not just any kind of farm production, but the kind we need for the war. The achievement reflects the decisions and efforts of millions of farmers, expressed in planting, breeding, and feeding operations. Much shifting of crops has taken place, along with improvement and changes in crop rotations. Science has contributed significantly to the results.

Our food production has increased faster in this war than it did during the first years of World War I, largely because the work has been more thoroughly planned, more highly organized, and more scientific. Farmers have aimed especially at particular kinds of farm production, notably eggs, dairy products, meats, and oil crops, and they have found it necessary to vary considerably from their customary farm practices. The result is qualitatively as well as quantitatively remarkable, but next year the Government wants the farmers to do

still better.

In 1944 the Government will ask farmers to plant 380 million acres, about 16 million acres more than in 1943, and more than in any previous year in our history. Possibly 1944 will chalk up still another high food record, though our farm plant is already utilizing nearly all the tillable land available. Increased emphasis will be placed on growing the right amounts of the right things in the right places. Farmers will convert more of their land to the production of the most needed crops. They have already gone far in that direction. Nevertheless, additional conversion is still possible, and in fact will be important for the duration. More acreage will be in crops such as dry beans, peas, soybeans, potatoes, and peanuts. Feed crops will be increased wherever they will produce more food or feed per acre than any alternative crop.

Civilian requirements are carefully calculated by economists in the War Food Administration (q.v.). Sometimes WFA asks the Army and Navy to change its estimated requirements so that civilian needs may be met. In some cases the change requested affects the total food requested; in other cases, the types of food desired. Shipments on lend-lease account may be cut down or changed from time to time, in line with supplies and other requirements. It was necessary this year, for example, to cut down the British call for cheese; on the other hand, the Russians presented an urgent request for dry peas and beans, and the allocation authorities decided the Russians needed these supplies more than we did. Naturally, our ability to satisfy these claims presupposes civilian rationing, which divides our limited food sup-plies for the best total advantage and plays no favorites. The price-control system plays a vital supporting role, in that it keeps essential foods within the reach of everyone. After supplies have been allocated, they must be shared. Price control plus rationing is the means.

Indications for 1944. The 1943 farm production will influence that of 1944. The 1943 peak of livestock production has been reached only by feeding more feed grain than can ordinarily be produced, by feeding more wheat than can ordinarily be spared, and by boosting livestock prices to a higher level relative to feed prices than can be maintained for more than a short period of time. Although livestock numbers are still increasing, we have already begun to feed the reserves of grain accumulated during recent good years. Also, as more ships become available, more of our grain will be needed for food and less can be used for feed. Soon we shall need to adjust our livestock

and poultry populations to numbers consistent with the quantity of grain and feed that we can currently produce and can spare for livestock.

Yet the lower adjustments in prospect need not mean lower food production, or even lower meat production in 1944. On a live-weight basis about 8 per cent of the livestock and poultry produced in 1943 will remain on farms at the end of the year. With pastures and ranges stocked nearly to their capacity, producers will need to increase the number of cattle marketed, and thus the market supply of beef. Hog marketings will probably reach a peak this fall, and will continue heavy into early 1944 even though the pig crop for market in middle and late 1944 may be smaller than it was this year.

It may be several years before dairymen can again afford to feed grain as liberally as they have during the past 12 months. The number of milk cows, however, is still increasing. Furthermore, commercial milk deliveries for manufacture and fluid sales may continue to increase even if the total milk production declines, because many farmers who are now selling cream and using the skim milk for feed will find it profitable to sell whole milk instead. From a nutrition standpoint it should be noted the increase in consumption of milk and whole milk products more than offsets the decrease in butter. The peak of egg production may come in the spring of 1944, but it has not yet been reached, and poultry flocks are still increasing rapidly.

But the problem of adjusting our livestock population to the changing situation will not solve itself. Farmers can draw further on the country's reserves of feed grain, and official agencies can facilitate increased grain imports. Adjustments through such means, however, can be only temporary. As the reserves of grain decline, the margin of returns from livestock over feed costs will probably decline too. Otherwise the farmers who usually have feed grain to sell might not want to sell it. They might prefer to increase their own flocks and herds; this would not leave enough feed for the farmers who depend on purchased grain. In the readjustment process, the balance of feed costs among areas may change, and the problem will arise of managing the total feed supply to the best advantage. It will be difficult entirely to prevent inequalities. The fact that we shall not have feed enough for all the livestock and poultry farmers would like to raise will necessarily affect different producers differently.

Primary in settling the matter will be continued need to maximize output of the products most desired.

Postwar Food Needs. As victory draws nearer the importance increases of estimating what adjustments will be necessary in agriculture when the fighting stops. Accordingly, the Department of Agriculture has tried to foresee what pattern our agriculture will have then, and what food requirements will exist in the early postwar years. It has also endeavored to gage the probable postwar condition of our agricultural plant, in crop and pasture land, range land, forest resources, farm buildings and machinery, technical facilities, farm finance, and other main features. The findings, though highly tentative, provide part of the necessary basis for postwar planning.

Broadly, the pattern our agriculture will have reached in 1944 shows what it will be like when the war ends. This is because in 1944 we shall be close to the top limit in our agricultural production, and because the composition of the output will be approximately fixed for the duration. We can still bring some additional land into cultivation and can still do some shifting into more productive crops and livestock products. But we are approaching the point at which the opportunity for such changes will be small. It seems probable that the level of total production we can expect in 1944 with normal yields, will be close to the maximum under wartime conditions and that only minor changes will develop for the remainder of the war period.

Food requirements, however, will continue to rise, and will be higher at the close of the war than they are now. Tentative estimates for 1944 and 1945 indicate large increases in requirements over 1943 supplies. Moreover, these estimates assume that certain marked changes will be brought about in civilian food habits and also that certain shipping limitations will persist. Should the anticipated changes not be brought about in civilian food habits and should the shipping situation improve greatly, the food-requirement estimates will have to be raised.

As a matter of fact, the Department believes it would be more accurate to speak, not of food requirements or of food needs, but of estimates of supplies that will be taken if they can be produced.

Arthur P. Chew.

AGRICULTURE, U.S. Department of (USDA). A Department of the U.S. Government. For activities in 1943, see AGRICULTURE. Since the United States entered the war the Department has undergone two major reorganizations in order to facilitate to the utmost the contribution of the Department toward winning the war. In December, 1941 (effected by Executive Order, Feb. 23, 1942), the 19 line agencies that previously reported directly to the Secretary were grouped for more effective coordination and action under the direction of eight group administrators: the Agricultural Conservation and Adjustment Administrator; the Farm Security Administrator; the Agricultural Marketing Administrator; the President, Commodity Credit Corporation; the Chief, Forest Service; the Agricultural Research Administrator; the Governor, Farm Credit Administration; and the Rural Electrification Administrator. There continued the general secretarial staff, and there was also established the Agricultural War Board to assist in coordinating the Department's efforts toward producing the food and fiber needed by the United States and her

Executive Order 9280 of Dec. 5, 1942, further streamlined and coordinated the Department's programs; thereafter, it comprised three major administrative groups, the Agricultural Research Administration, the Food Production Administration, and the Food Distribution Administration. The Agricultural War Board (later National War Board) continued in its advisory capacity, but was known as the Departmental War Board.

Another shift occurred when the President, Mar. 6, 1943, transferred the Nutrition Division of the Office of Defense Health and Welfare Services to

the Food Distribution Administration of the Department. The Nutrition Division was consolidated with the Food Conservation Branch of the FDA, now designated as the Nutrition and Food Conservation Branch. On Mar. 26, 1943, the President consolidated the Food Production Administration (except the Farm Credit Administration), the Food Distribution Administration, the Commodity Credit Corporation, and the Extension Service into an Administration of Food Production and Distribution (later changed by Executive Order 9334, of Apr. 19, 1943, to War Food Administration), to be under the direction and supervision of an Administrator who is directly responsible to the President. All powers with respect to labor and manpower previously vested in the Secretary of Agriculture by orders of the Economic Stabilization Director and the Chairman of the War Manpower Commission were also vested in the Administrator. He also defined the functions and relationship of the Secretary and the War Food Administrator, to the extent necessary to enable them to perform their respective duties and functions.

By an Administrator's Memorandum issued Jan. 21, 1944, the names of the Food Production Administration and the Food Distribution Administration were changed to Office of Production and Office of Distribution, respectively. At the same time the Agricultural Adjustment Agency, the Farm Security Administration, and the Soil Conservation Service became independent agencies under the War Food Administrator, and an Office of Price was established to handle matters dealing with prices fixed for and price support of agricultural commodities.

ALABAMA. An east south central State. Area: 51,609 sq. mi. Population: 2,832,961 (1940 census); 2,777,322 (1943 nonmilitary estimate).

Statistics. Statistical information pertaining to each of the 48 States and the District of Columbia has been assembled in comparative tables which appear in the following articles. Acriculture; Mineral Production; Roads and Streets; Schools; Social Security Board; Taxation; Universities; and Vital Statistics. The census of manufactures has been suspended for the time being; for the latest information, see 1941 Year Book, p. 430.

Elections. See the article Elections in the United States; also, for incumbents, House of Representatives and Senate.

Legislation. See the separate article on State Legislation.

Officers. The Governor is Chauncey M. Sparks (Dem.), inaugurated in January, 1943, for a four-year term; Lieutenant Governor, L. Handy Ellis; Secretary of State, Howell Turner; Attorney General, William N. McQueen.

ALASKA. The Territory of Alaska lies in the far northwest corner of the North American continent and includes the Aleutian Islands which extend westward more than 1,200 miles toward the Kamchatka Peninsula. Area, 536,400 square miles, inclusive of inland waters. Population, 1940, (taken Oct. 1, 1939) 72,524. Whites (1939) numbered 39,170; Indians and Eskimos, 32,458. Capitol, Juneau; population (1940) 5,729. Governor, Ernest Gruening, The strategic importance of Alaska, both from a defensive as well as offensive standpoint, has accelerated population trends in this region. Normally the annual fluctuation of laborers for seasonal work is 20,000 but wartime activities have increased the civilian population to an estimated 100.000.

Government and Political Status. Although Alaska was purchased from Russia in 1867 for \$7,200,000 it did not become an "incorporated Territory" until 1912 when Congress passed an Organic Act creating the Territory of Alaska. Under its terms the

Territory does not merely belong to the United States but is a part thereof. Of all the other territories belonging to the United States only Hawaii has a similar status. The Constitution and laws of the United States are automatically in force, with the exception of certain provisions which are clearly not applicable. The Governor is appointed by the President for a term of four years. Some Alaska departmental heads are appointed by the Governor, others are chosen by popular election. The Territorial Legislature consists of a Senate of 8 members and a House of Representatives of 16 members. Alaska has no Territorial judiciary, the four Federal judges being appointees of the President for terms of four years. Financing the territory is chiefly a Federal function. This is in a large measure due to the fact that the U.S. Government owns 99 per cent of Alaska's land. Federal taxes collected locally are returned to the Territory. In addition there are regular and special Congressional appropriations which include the expenses of the Legislature, the Governor's salary, and the health, welfare, and education of the natives (approximately 50 per cent of the 1940 population). Administration and supervision over Territorial affairs is not delegated solely to the local government but has remained a Federal function. More than 50 Federal agencies participate in the management of Alaska's problems.

Aviation and Communications. The Alaska Aeronautics and Communications Commission has general supervision over aviation and communications in the Territory. It is charged with the formulation of policy and enforces rules and regulations con-cerning the safety of persons operating or using planes, and over persons and property on the ground. The Territory has 20 radio communication stations in widely scattered towns, with operators in many stations taking observations for the U.S. Weather Bureau. The following figures show the growth of aviation in Alaska in 1942 over 1941:

| Aeronautical Operations     | 1942       | % gain |  |
|-----------------------------|------------|--------|--|
| Number of hours flying time | 44,182     | 10     |  |
| Number of miles             |            | 11     |  |
| Number of passengers flown  | 57,028     | 37     |  |
| Number of passenger miles   | 11,106,122 | 43     |  |
| Pounds of mail flown        | 954,026    | 56     |  |

Forests. Alaska's two national forests have a combined area of 20,864,000 acres and an estimated timber stand of 84,760,000,000 board feet. These resources are readily accessible from protected waterways and can be purchased for the use of local manufacturing industries and individuals. Such extensive holdings are capable of enormous products of pulp and paper. There is a potential annual yield of over 1,000,000 tons of newsprint which is one-fourth of the present total requirements of the United States. These areas can also furnish good locations for waterpower development, industrial plants, town sites, fox farming, recreational activities, and many other special pur-

Fors. Fur farming is an important industry in the Territory with wildlife resources valued at \$100,-000,000. In 1941, 608,419 pelts brought \$2,280,-538.50. Muskrats headed the list with 511,805 pelts valued at \$818,888; beaver was worth \$525,-453; and mink skins brought \$333,711. Other furs marketed in order of total value were: blue fox, white fox, red fox, lynx, otter, marten, cross fox, silver fox, wolf, weasel, coyote, wolverine, polar bear, squirrel, black bear, marmot, and hare. During the year ending June 30, 1943, the fur seal industry in the Pribilof Islands yielded a record-

breaking take of 117,164 skins. This was due in a large measure to the fact that military circumstances had halted this business the preceding year after only 127 seals had been killed. For mineral production and fishing statistics (latest available) see Year Book for 1943, pp. 23–24.

Education. Alaska has two school systems, one for

white children and those of mixed blood, called the Territorial Schools, and the other for natives (Indians and Eskimos) known as the Native Schools. In the case of the former the Territory has full responsibility for the control, administration, and financing of education whereas in the latter the Federal Government, through the Office of Indian Affairs, assumes the educational burden. The Territorial system in 1942 had 56 rural and 18 city schools with 6,754 pupils. In the same year there were 120 elementary and 3 vocational boarding schools (secondary) for the natives. Subjects taught in the Territorial Schools correspond to a considerable degree to the curriculum in the public schools in the States. Emphasis in the Federal system is placed upon those vocational skills which will enable children to earn a living in the particular region where they reside.
The University of Alaska, founded in 1922, re-

flects the pioneering nature of the practical interests and needs of the people. It is an accredited member of the Northwest Association of secondary and higher schools. In 1942 the faculty numbered 36 instructors. Courses leading toward a bachelor's degree are offered in agriculture, arts and letters, business administration, chemistry, civil engineering, education, general science, home economics, mining engineering, and pre-medicine. Preliminary curricula, in which degrees are not yet awarded. are: aeronautical, architectural, chemical, electrical and mechanical engineering, fisheries, forestry, journalism, law, and nursing. Short courses and graduate studies are available in a few specialized fields. Tuition is free to residents of the Territory.

History. During 1943 the scene of active warfare moved westward from Alaska when Japan lost its toe hold in the Aleutians. Defeat of the Japanese at Dutch Harbor on June 3, 1942, and at Attu and Kiska in 1943 permitted the U.S. armed forces to move from defensive to offensive preparations. This Territory held a unique military position: as a valuable base from which to attack Japan and also to supply Russia and China by means of shorter air routes. From Kiska to Manila the distance was only 4,000 miles, but from San Francisco to Manila it was 7,700 miles. From Fairbanks in the center of Alaska the air-line distance to Murmansk was about 3,235 miles or half the route used by most ocean convoys. Military bases in Alaska had now become depots for transshipment of men, materiel, and supplies.

The people of Alaska consistently exceeded their quota of war bonds. Their percentage in the last month of the fiscal year exceeded that of any of the 48 States and was topped only by Hawaii's record. Alaska's most famous industry—gold mining—was suspended for the duration, except in those mines where strategic minerals could be recovered with the gold. Steps were taken by the government to prepare for peace-time conditions. Joint economic committees of the United States and Canada began to collaborate on the development of 1,000,000 square miles of Alaska, British Columbia, and the Yukon Territory. The population of this expanse numbered about 100,000 or roughly one person for every 10 square miles. The problem was how to develop and harness the tremendous natural resources. Completion of the Alaska Highway

(q.v.) was one step in this direction. Another was the formal opening of telephone communications with the United States on Nov. 19, 1943. The final link in this system covered 2,026 miles from Edmonton to Fairbanks, Alaska. Credit for the planning and supervision of the project belonged to the U.S. Army Signal Corps. The introduction in Congress of a bill by Senators William Langer and Patrick McCarran to extend Statehood to the Territory of Alaska reflected its progress and growing importance in American life.

See Aqueducts; Canada and Japan under *History*; War Communications, Board of.

CHARLES F. REID.

Alaska Highway. In an exchange of notes between the Canadian and U.S. Governments, made public on July 22, 1943, they agreed that the so-called Alcan Highway from Dawson Creek, British Columbia, to Fairbanks, Alaska, be given the official name "Alaska Highway." The Alaska Highway was opened to through traffic in October, 1942 (see 1943 Year Book, pp. 23, 25, for map and description). The work of installing permanent bridges and completing construction continued throughout 1943 and was expected to end in 1944. See Aqueducts; Bridges; Roads and Streets.

Albania. A former Balkan kingdom on the east shore of the Adriatic Sea, occupied by Italian troops on Apr. 7, 1939, and proclaimed an Italian protectorate the following day. Excluding the Greek and Yugoslav districts (5,790 sq. mi. with about 700,000 inhabitants) annexed to Albania in 1941, the area was 10,629 square miles and the estimated population 1,063,000 on Jan. 1, 1940 (1,003,124 at the 1930 census). Living births were about 30,662 in 1941; deaths, 18,188. Capital, Tirana (pop. 30,806 in 1930); other chief towns, Scutari (Shkodër), 29,209; Koritsa (Korçë), 22,787; Elbasan, 13,796; Durazzo (Durrës), the chief port, 8,739. Most of the cities of southern and central Albania were badly damaged during the Italo-Greek war of 1940–41.

Education and Religion. Primary education is nominally compulsory, but illiteracy remains high. In 1939 there were 663 state primary schools, with 56,936 pupils; 19 intermediate schools, with 6,235 pupils; and about 500 Albanian students in various foreign universities. The estimated religious division of the population was: Moslems, 688,280; Orthodox Christians, 210,313; Roman Catholics, 104,184

Production, etc. Albania's chief products, with their output in 1939 in metric tons where available, are: Corn, 123,400; tobacco, 2,700; olive oil, over 4,000 in 1942; wool, 2,100; petroleum, 208,000; timber, hides, dairy products, and fish. Crude oil output averaged 13,000 metric tons monthly during the first quarter of 1942. Other production in 1939 (metric tons) was: Wheat, 50,200; barley, 5,200; rye, 3,200; oats, 13,000. In 1938 there were 1,573,857 sheep, 391,175 cattle, 54,426 horses, 44,579 asses, and 10,391 mules. There are copper, chrome, and other mineral deposits, which Italy commenced to exploit in 1940. Flour, olive oil, and cheese are the principal manufactures. For the latest figures on foreign trade and finance, see 1943 Year Book.

on foreign trade and finance, see 1943 Year Book.

Transportation. The highway network extended 1,759 miles in 1940 (750 miles suitable for motor traffic), but this was badly disrupted by war in 1940-41. Italian air services connect Tirana and other Albanian cities with Rome and other points. Construction of a railway between Durazzo and Elbasan, the first line in Albania, was begun in

May, 1940. An Italian-Bulgarian accord of Oct. 7, 1942, called for construction of a motor highway between Durazzo and Sofia.

Government. King Zog I, proclaimed King of Albania by an independent National Assembly Sept. 1, 1928, was dethroned Apr. 12, 1939, by an Italian-controlled Constituent Assembly, which abrogated the existing constitution. An Italian-sponsored government then offered the Crown of Albania to King Victor Emmanuel of Italy. A personal union between the two kingdoms was thus effected Apr. 14, 1939. The following June 3 Victor Emmanuel issued a constitutional statute making the Albanian throne hereditary under his dynasty and vesting legislative, judicial, and executive powers in the King's hands. Legislative powers were delegated in part to an Albanian Fascist Corporative Council, based on a newly organized Albanian Fascist party, and executive and judicial powers to Albanian officials acting under Italian guidance. Albanian remained the official language. A treaty signed the same date placed Albania's foreign relations in the hands of the Rome Government (see Year Book for 1939, p. 22). Under Italian direction, Albania was involved in war with Greece on Oct. 28, 1940. The puppet Government declared a state of war with the Union of Soviet Socialist Republics on June 28, 1941, and with the United States on Dec. 17, 1941.

History. The overthrow of Mussolini on June 25, 1943, and the capitulation of the Badoglio Government in Italy to the Allies early in September led German armed forces to wrest control of Albania from the Italian army of occupation and to establish a pro-German puppet government at Tirana. The Germans also undertook to crush the guerrilla bands that controlled large districts in the interior and had kept some 100,000 Italian troops tied down in Albania.

The three principal guerrilla-patriot groups fighting the Axis forces were those led by Col. Muharrem Bajraktari in the northeast, by Myslim Pesa in the central region around Tirana, and by Col. Bilal Nivica in the south. These groups had intensified their activities early in 1943 as a result of pledges of Albanian independence given by the British, American, and Soviet Governments late in 1942. During the spring they successfully resisted a drive to exterminate them led by the former Italian Chief of Staff, Gen. Alberto Pariani, who was named Lieutenant General of Albania for that purpose. Meanwhile the growing unrest in Albania led to four successive reorganizations of the Italian-controlled puppet government at Tirana in the first half of 1943.

The German drive against the Albanian guerrillas was handicapped during the second half of the year by Anglo-American air and sea attacks upon German military bases. British warships in November and December repeatedly shelled Durazzo and other Albanian ports under German control, while American and British bombers based in southern Italy attacked German airfields and supply bases. Prime Minister Churchill stated in Parliament on November 4 that British liaison officers were aiding thousands of Albanian guerrillas. With the help of Allied munitions and supplies, the guerrillas continued to harass the Germans and disrupt their communications despite German bombing and burning of villages in the guerrilla districts and the slaughter of civilians.

Churchill in his statement of November 4 reiterated his Government's support of Albanian independence. But there was no Allied agreement as to the composition of an independent government. King Zog from his place of refuge in London continued throughout 1943 his unsuccessful efforts to win Allied recognition as the legal head of the Albanian state. In a statement issued in London October 15 he voiced disappointment that "although we have asked many times to be accepted among the United Nations, we are still left out." Apparently there was little support for Zog among the Albanian guerrillas. Late in October the pro-German puppet regime at Tirana appointed a Regency Council, giving rise to reports that the Germans were grooming the Prince of Wied for a return to the throne which he was forced to vacate after a brief and stormy reign in 1914.

See ITALY under History.

Alberta. A western province of Canada. Area, 255, 285 square miles, including 6,485 square miles of fresh water. Population (1941 census), 796,169 (426,458 male; 369,711 female). Racial origin of the population (1941 census): British 399,432, German 77,721, Ukrainian 71,868, Scandinavian 63,494, French 42,979, Polish 25,845, Netherland 20,429, Russian 19,316, etc. Religious membership (1941 census): United Church 193,664, Roman Catholic 191,343, Anglican 113,279, Lutheran 84,630, Presbyterian 68,910, Greek Orthodox 34,991, Baptist 32,268, Mormon 14,960, Mennonite 12,097. Chief cities: Edmonton (capital) 93,817 inhabitants in 1941, Calgary 88,904, Lethbridge 14,612, Medicine Hat 10,571. In 1942 there were 18,203 live births, 6,077 deaths, and 9,033 marriages. Education (1940–41): 180,169 students enrolled in schools and colleges.

Production. The gross value of agricultural output for 1942 was \$365,607,000 (field crops accounted for \$231,568,000, farm animals \$88,720,000, milk \$24,408,000, poultry and eggs \$13,884,000, fruits and vegetables \$3,759,000, fur farming \$1,065,000). Chief field crops (1942): wheat 178,000,000 bu., oats 175,000,000 bu., barley 75,000,000 bu., rye 4,400,000 bu., flaxseed 2,200,000 bu., potatoes 135,400 tons, turnips, etc. 24,000 tons, hay 1,337,000 tons, grain hay 1,600,000 tons, sugar beets 342,000 tons. Livestock (June 1, 1943): 1,627,000 cattle (inc. 376,000 milk cows), 2,337,700 swine, 900,000 sheep, 627,900 horses, 9,202,000 hens and chickens, 570,200 turkeys. Furs (1941–42): 11,

713,686 pelts valued at \$5,162,636.

Mineral output in 1942 was valued at \$46,410,-960, of which coal (7,665,052 tons) accounted for \$22,386,637, petroleum (10,150,000 bbl.) for \$15,-500,000, and natural gas (31,000,000 M cu. ft.) for \$5,270,000. Manufacturing (1941): 1,108 plants, 16,761 employees, \$20,151,705 for wages, \$94,176,-887 for cost of materials, \$45,958,219—the net

value of production.

Government. Finance (year ended Mar. 31, 1942): revenue \$27,213,546; expenditure \$19,965,125; total direct and indirect liabilities (less sinking funds) \$158,742,013. The executive power is vested nominally in the Lieutenant Governor but actually in the ministry of the Legislature. There is a Legislative Assembly of 57 members elected by direct vote of the people (36 Social Credit, 19 Independent, and 2 other members were elected at the provincial general election of Mar. 21, 1940). Alberta is represented by 6 Senators (appointed for life) and 17 elected commoners in the Dominion Parliament at Ottawa. Lieutenant Governor, J. C. Bowen (appointed Mar. 20, 1937); Premier, E. C. Manning (Social Credit), sworn in (May 31, 1943) to succeed William Aberhart (q.v.) who died May 23, 1943. See Canada under History.

ALCAN HIGHWAY. Former name of the Alaska Highway (q.v.).

ALCOHOLS. See CHEMICAL INDUSTRIES; CHEMISTRY under *Alcohols*; RUBBER. Also see Liquor Production. For Alcoholism see Psychiatry.

ALDOL PROCESS. See RUBBER.

ALEUTIAN ISLANDS. See FISH AND WILDLIFE SERVICE; WORLD WAR under The War in the Pacific.

Algeria. A north African territory of France. Area, 851,350 square miles, of which all except 222,206 square miles are desert. Capital, Algiers (Alger). The estimated population on Jan. 1, 1940, was 7,600,000. At the 1936 census there were 7,234,684 inhabitants (6,592,033 in the Northern Territory and 642,651 in the Southern Territory), including 987,252 Europeans (853,209 French citizens) and 6,247,432 Moslem natives. On July 22, 1940, there were 20,000 Italians permanently established in Algeria. Chief cities (1936 populations): Algiers, 264,232; Oran, 200,671; Constantine, 113,777; Bona (Bône), 86,332; Philippeville, 66,112; Sidibel-Abbes, 54,754.

Production. The main occupations of the people are agriculture and stock raising. In 1941 yields of important cereal crops (in metric tons) were: Wheat, 870,900; barley, 696,700; oats, 116,100. Tobacco production was 12,200 metric tons in 1940; olive oil, 8,500 in 1940–41; wool and mohair, 7,400 in 1938; natural phosphates, 450,000 in 1939; pyrites, 44,000 in 1938; iron ore (metal content), 1,500,000 in 1939. Wine production in 1941 was 10,460,000 hectoliters (hectoliter equals 26.42 U.S. gal.). Dates, figs, bananas, and almonds

are other important crops.

Trade and Finance. No trade figures have been published since the outbreak of World War II (see 1943 Year Book for latest statistics). Normally four-fifths of Algeria's trade was with France. Budget estimates for 1940 placed revenues at 2,526,128,968 francs; expenditures, 2,525,778,285 francs. In January, 1943, Gen. Henri Giraud's High Commissariat for French North Africa (Algeria, Morocco, Tunisia) adopted a budget of \$299,302,586, of which all except \$16,000,000 was allotted for military purposes. After the Allied landings in North Africa, the franc was pegged at 300 to the pound sterling and later revised to 200 to the pound.

Transportation. In 1941 Algeria had about 2,734 miles of railway line in operation, 43,239 miles of roads, and air services connecting Algiers with other North African cities and with Marseille, France. Construction of a trans-Saharan railway linking the Algerian and Moroccan railway network with the Niger River in French West Africa was begun in 1941 and carried southward to a point 40 miles south of Colomb-Bechar by July, 1942. Construction was discontinued after the Anglo-American landings in North Africa Nov. 8, 1942. Communications across the Sahara with French West Africa meanwhile were maintained by air and by two motor services linking Colomb-Bechar with Gao, and Algiers with Zinder and Niamey. The shipping tonnage handled in Algerian ports declined from 12,441,000 in 1938 to 6,277,000 in 1940.

Government. Administration was centralized in the hands of a Governor General appointed by the French Government. Previous to the collapse of the French Republic in 1940, the departments of Algiers, Oran, and Constantine in Northern Algeria were considered integral parts of metropolitan France and were represented in the French Parliament by 10 deputies and three senators. Southern Algeria had a French military government. Under

the Vichy regime, full executive and legislative powers for the entire colony were vested in the Governor General. Governor General at the beginning of 1943, Gen. Yves Chatel (appointed November, 1941). Chatel aligned Algeria with the "provisional government" established by Adm. François Darlan at Algiers on Nov. 12, 1942 (see 1943 Year Book, p. 27). For developments during 1943, see below.

### HISTORY

Political Events. Algeria during 1943 played a central role in the Allied drive to expel the Germans from France and the movement for the restoration of French unity and independence. It served as a base of operations for General Eisenhower's armies during the Tunisian, Sicilian, and Italian campaigns. Algiers was used as the Allied headquarters for both military operations in the Western Mediterranean and relief and rehabilitation work throughout French North Africa. The establishment of the Darlan-Giraud regime there on Nov. 12, 1942, had made the city the capital of French North and West Africa. When Ciraud's administration was merged with the Fighting French movement in the French Committee of National Liberation early in June, 1943, Algiers became in effect the provisional capital of the entire French overseas empire.

The political evolution in Algiers and throughout French North Africa away from the pro-Fascist, totalitarian methods and principles implanted by the Vichy Government under German influence is described in the article on France under *History*. In line with this evolution, Governor General Chatel of Algeria was replaced by Marcel Peyrouton late in January and Peyrouton was succeeded by Gen. Georges Catroux in June. Catroux was also appointed Commissioner for Moslem Affairs by the Committee of National Libera-

The Giraud decrees of March 17 repealed all Vichy legislation in North Africa contrary to the principles of the Constitution of the French Republic, including laws discriminating against Jews and Masons. The Algerian Councils General and elected municipal assemblies throughout North Africa holding office up to June 22, 1940, were restored and their powers prolonged until new elections could be arranged by a future constitutional government of France. (The Cremieux decree of Oct. 28, 1870, granting French citizenship to Algerian-born Jews, was revoked at the same time, but was restored the following October 21.) Freedom of speech, press, and assembly was restored to a considerable degree, although subject to the emergency laws issued by the French Republican government in August, 1939. Some 5,000 political prisoners held in concentration and forced labor camps were released under the supervision of an Anglo-American commission. Among them were about 700 Spanish Republican refugees, most of whom obtained visas for Mexico.

This strongly democratic trend, produced by combined pressure from the adherents of Gen. Charles de Gaulle's Fighting French movement and the British and American Governments, was welcomed by most of the French civilian population of the North African cities and by many in the lower ranks of the French armed forces in that region. But it was repugnant to many of the French landowners, the well-to-do business men and industrialists, and many of the higher army officers.

Moslem representatives from Algeria, Morocco,

Tunisia, and French West Africa on the Permanent Council of War Economy at Algiers, affirmed their loyalty to the Allied cause on March 6. However, the danger of an Arab-Moslem rising was not considered ended until after the Allied victory over the Axis forces in Tunisia and the improvement of difficult economic conditions. Some of the native nationalists had placed their hopes for independence in a German victory. A number of Arabs were executed by the Giraud regime for espionage and sabotage on behalf of the Axis early in the year. But the bulk of the Arabs remained sympathetic or indifferent to the Allied cause, partly because of the friendly relations established by American soldiers and the conciliatory efforts of French officials.

As a friendly gesture toward the 18,000,000 Moslems in French North Africa, the Committee on National Liberation on August 24 undertook to provide facilities for the annual pilgrimage to Mecca, which had not taken place since October, 1939. Moslem leaders, however, pressed the French for more substantial concessions in the way of economic and political reforms. The entire Moslem delegation to the Algerian Financial Council demanded certain "financial reforms" with such insistence that Governor General Catroux on September 22 dissolved the delegation of 24 Arabs and interned two of the leaders. The latter were charged with provoking civil disobedience, disturbing public order during time of war, and attempting to impede the functioning of public institutions. The French members of the Financial Council then proceeded to approve an increase in taxation and the expenditure of an additional 257,-000,000 francs (about \$5,140,000) for the French war effort.

An expected political crisis over Catroux's action failed to materialize. On October 16 the French Committee of National Liberation approved the reestablishment of the Moslem financial delegation in response to an Arab petition. The restoration on October 21 of the Cremieux law, which placed Algerian Jews in a favored position as compared with the Moslems, raised the possibility of more trouble. However in a speech at Constantine December 12 General de Gaulle announced the decision of the Committee of National Liberation to grant French citizenship to "tens of thousands of French Moslems" in Algeria, to increase the proportion of Moslems in local councils and public offices, and to improve Moslem living conditions. This was followed on December 14 by a decree granting French citizenship to all Algerian Moslems who could read and write French. Only about 10 per cent of the 6,000,000 Moslems in Algeria had elementary educations.

Economic Developments. The economic relief and rehabilitation measures inaugurated in French North Africa by Anglo-American authorities late in 1942 (see 1943 Year Book) were extended during 1943. Yet the economic situation remained extremely difficult. For two years previous to the Anglo-American landings, North Africa had been drained of food supplies and raw materials by metropolitan France and Germany while receiving very few consumers goods in return. Shortages of sugar, tea, cotton cloth, motor trucks, gasoline, and machinery parts, coupled with distrust of the currency, led farmers to withhold their crops and encouraged widespread black market operations.

Despite the distribution of Anglo-American relief supplies, the situation showed little improvement during the first part of 1943. Giraud's mobilization of men to build up the armed forces and the demand for laborers by the British and American armies caused an acute labor shortage and reduced food production. Requisitioning of trucks by the French army and the strain placed on all transportation facilities by the campaign in Tunisia prevented the delivery of farm produce to the larger cities. Free spending by the Allied armed forces had a highly inflationary effect, and led producers to hold their stocks for higher prices. On August 29 Governor General Catroux was forced to threaten farmers with internment and confiscation of their food stocks unless surplus grain was delivered for sale on the general market by November 1. Effective September 1, he ordered a 25 per cent increase in wages and salaries.

To prevent further deterioration of the economic situation the North African Economic Board, an Anglo-American agency, arranged for a steady inflow of lend-lease and other civilian supplies from America and Britain. Up to May 22 some 600,000 tons of food, fuel, clothing, medical supplies, and other necessities had been distributed, while some 350,000 tons of North African minerals and other strategic raw materials had been delivered to the United States and Britain. Non-military imports from overseas continued at the rate of some 30,000 tons monthly during the rest

of the year.

Of the \$40,000,000 of lend-lease-civilian supplies sent to North Africa by the United States up to June 27, \$25,000,000 had already been repaid by the French authorities. The distribution of cloth proved particularly effective in stimulating production by native farmers. In the five months ending with July, more than 300,000 tons of coal and food was sent to French North Africa from Britain. Due to increased North African production, food imports from United Nations sources were cut off completely during the second half of 1943 except for sugar, tea, and milk.

See Monocco and Tunisia under History.

ALIEN PROPERTY CUSTODIAN, Office of. A war agency of the United States government, established by executive order of Mar. 11, 1942. The Alien Property Custodian has the power to direct, manage, supervise, control, or vest property of nationals of enemy or enemy-occupied countries. As of Aug. 31, 1943, the Office of Alien Property Custodian had taken over the enemy interest in 386 business enterprises, 203 parcels of real estate, 29 ships, 117 lots of miscellaneous tangible property. The Office had also taken title to more than 41,000 patents and patent applications formerly owned by nationals of enemy countries and enemy-occupied territories. Many of the enterprises and all the ships have been put to work supporting the war effort. The patents are being licensed to American industry, as applications are received, on a nonexclusive, royalty-free basis for the life of the patent.

ALSACE-LORRAINE. The two border provinces annexed by Germany after the Franco-Prussian War and returned to France by the Versailles Treaty (June 29, 1919). They were reoccupied by German troops in June, 1940, and placed under German civil administration on or about Nov. 30, 1940. Area, 5,605 square miles; population (1936 census), 1,915,627. Lorraine was merged with the Saar district (Saarpfalz) to form the new German province of Westmark. See France under History.

ALUMINUM. Americans who, in 1942, had tossed their saucepans into community scrap piles, were astounded to find that, a year later, supply of aluminum progressively was forging ahead of requirements and that aluminium scrap was a drug on the market. The War Production Board depicts the winning of the race for adequacy as follows:

| T   | otal Supply                      | Allotments                       |
|---|----------------------------------|----------------------------------|
| <i>194</i> 3  | (Millions                        | of lb.)                          |
| First quarter Second quarter Third quarter Fourth quarter | 582.1<br>633.4<br>790.4<br>871.2 | 534.8<br>585.5<br>661.6<br>774.0 |
| Total   | 2,877.1                          | 2,555.9                          |

Reasons given were (1) more careful screening of aircraft requirements; (2) more conservative statements of requirements by principal consuming groups in the war program as a result of longer experience in compiling estimates; (3) failure of fabricating plants, such as forge shops and extrusion producers, to gobble ingots as fast as they

were produced.

Although occasional bottlenecks in fabricating capacity popped up during the year, downward revision of the Army's estimated requirements and the expectedly high rate of productivity from existing plants made possible cancellation of contracts to build three huge aluminum extrusion plants at Memphis, Tenn., Columbus, Neb., and Hammond, Ind. The aluminum fabricating industry already was a giant. Compared to 1939, estimated 1943 output of aluminum forgings was 45 times as great, tubing 13 times, rod and wire 12 times, extruded shapes 10 times, and aluminum sheets 7 times.

Capacity of primary aluminum plants, those which produce metal from ore rather than from scrap, today is rated at 2,200,000,000 lb. annually for the United States. Since many of these plants were not in full production throughout 1943, and because labor necessary for capacity output was not always available, the year's total was about 360,000,000 lb. less. The value of 1943 output was \$276,000,000, compared to \$150,768,000 in 1942. At the end of 1943, WPB curtailed production be-

cause of oversupply.

An avalanche of scrap aluminum from factorics and demolished aircraft from the battle front broke the OPA ceiling price in the fall of the year, the oversupply of scrap amounting to 10 million lb. by the end of August. For a time there were no buyers at any price. Secondary aluminum smelters—those melting aluminum scrap—had lowered their prices on ingots as much as 2½ to 3 cents per lb. by the end of November, a situation partially recognized by OPA in mid-November when ceilings on aluminum scrap and secondary ingots were reduced 1½ cents per lb. The new base price for secondary in-

got was 12½ cents per lb. To relieve the situation, the government agreed to purchase and stockpile, through Metals Reserve Co., 18 classes of secondary ingot. A corollary program was introduced to encourage greater use of secondary aluminum by the Army and Navy, lend-lease to Russia, and re-laxation of use restrictions.

A scarcity of ore threatened early in 1943 when vessels from Dutch Guiana were sunk with grim regularity in the Caribbean by Nazi U-boats. Arkansas and Alabama bauxite mines increased production, however, and together with the thwarted U-boat menace, prevented an ore paucity. The United States production of domestic bauxite totaled 7,166,000 short tons in 1943, and imports of South American bauxite amounted to nearly 1,500,-000 short tons. Stockpiles of more than 4,000,000 tons were accumulated.

Canada contributed to American supply by delivering 600 million lb. of a 1,300,000,000-lb. contract by the end of November. The balance was scheduled to be delivered at the rate of 40 million lb. a month, which would complete the contract in

early 1945.

Slightly more than one half of primary aluminum capacity is government owned, and more than 80 per cent of new fabricating facilities, which have mushroomed from practically nothing during the war, are government financed. The problem of utilizing these plants following the war, when aircraft requirements will be sharply cut, is a knotty one. Secretary of Commerce Jesse Jones believes that about 900 million lb. of primary aluminum a year represents the immediate postwar market. Three times prewar consumption, this represents only about 40 per cent of present plant capacity.

AMERICAN LEGION, The. An organization of American veterans of both World Wars I and II. It became a two-war organization, Oct. 29, 1942, when President Roosevelt signed Public Act 767, making honorably discharged veterans of World War II eligible for membership. The Congressional amending of the 1919 charter was authorized by the first wartime convention in Kansas City, Mo., Sept. 19-21, 1942. The second wartime convention in Omaha, Neb., Sept. 21-23, 1943, again was a streamlined affair, with attendance restricted to 1,534 delegates, national officers, and a few key committeemen. The annual parade and the musical tournaments again were dispensed with. The outstanding declaration of the Omaha convention was its foreign relations policy. It urged United States participation in the establishment and maintenance of an organization of free and sovereign nations cooperating for the preservation of peace, and called for that cooperation to be implemented with whatever force may be necessary to prevent a recurrence of war.

Major Legislative Program. The national executive committee in Indianapolis, Nov. 18–19, 1943, designated the major legislative program of The American Legion for 1944 to be universal service in time of war, adoption of a permanent policy of universal military training, postwar planning, and adequate protection of disabled veterans of World Wars I and II and their dependents.

War Effort. Accomplishments in 1943 included: Hundreds of millions of dollars worth of war bonds and stamps sold in Legion drives; helping the Navy secure its quotas of WAVES and SEABEES; repeatedly condemning all interruptions of war production, whether due to industry or labor; earning recognition from the War Production Board that the Legion's metal scrap drives were the most valuable in the nation; launching by official government request of a nationwide "America Alert" program to impress upon all citizens that the end of the war is not in sight, that the signal for the relaxation of the war effort on the home front must come from the battlefronts, and that the necessity of protection through civilian defense is continuous until the end of the war; cooperation by 75,000 Legionnaires with the FBI against all subversive activities; creation of an American Legion postwar planning commission.

Special Services to Armed Forces. Approximately 18,000 sets of new records, 48 records to the set, were furnished to members of the armed forces for their entertainment, as the result of shellac made available through many hundreds of thousands of old phonograph records collected over the nation. More than a million decks of playing cards collected by the Legion's fun and honor society, the Forty and Eight, were distributed to service men abroad. More than 2,118,000 copies of "Fall In," a booklet of instruction and advice, went to members of the armed forces, and hundreds of thousands of copies of a booklet "At Home" to members of their families. More than 1,500 posts sent home-town newspapers to members of the armed forces. A free weekly American Legion news and picture service was inaugurated and extended to approximately 1,100 Army and Navy service publications. A comprehensive program of special services to the members of the armed forces and their families was set up, financed by an appropriation of \$250,000.

Rehabilitation. The American Legion launched a

vigorous fight on behalf of disabled veterans of World War II, particularly battle casualties, to eliminate delays ranging from 3 to 11 months in the settlements of their rightful claims for government compensation following their discharges from hospitals, and for the provision of muster-out pay. It drafted an orderly program of demobilization with recommendations for muster-out pay, vocational training, and placing of honorably discharged veterans into jobs without unnecessary delays. The national rehabilitation committee recovered \$2,952,731.48 in various contested benefits of the c fits for thousands of World War I and II veterans and their dependents without any cost to these

beneficiaries.

Americanism. Machinery was set up for raising an Americanism endowment fund of \$10,000,000 or more by public subscription, to aid in the preservation of the American way of life.

Approximately 500,000 boys under 17 years of

age were enrolled in the annual Junior Baseball

program.

In 18 Boys' States, more than 8,000 boys selected for leadership qualities received training in civic government by setting up and performing the functions of a mythical 49th State. Students from 47 States, numbering 120,000 participated in the national high school oratorical contest on the U.S. Constitution and Bill of Rights. More than 11,000 medals were awarded through posts and Auxiliary units to public school pupils outstanding in scholarship and leadership qualities, and 3,000 Boy Scout troops were sponsored.

Child Welfare. A program of visual parent education in the wartime care of children was launched to combat the spread of juvenile delinquency. The known total of \$2,364,484 was expended in emergency financial aid to 493,999 needy children, mostly for food, clothing, and medical treatments; aid was extended to needy children of World War II veterans.

Membership. During 1948 the Legion reached a new high in membership. On Dec. 31, 1943, there were 1,172,971 members. The total included more than 100,000 honorably discharged World War II veterans. Posts numbered 11,941, a new high. The Auxiliary enrolled a membership of 534,630 in 9,375 units. The Sons of The American Legion closed the year with 37,267 members in 3,488 squadrons. The Forty and Eight membership climbed to a new peak with 48,971 members in 717 voitures. The Eight and Forty pushed to a new high with 8,300 members in 300 salons.

National Commander for 1943–44: Warren H. Atherton of Stockton, Cal. National headquarters are at 777 North Meridian Street, Indianapolis, Ind. Legislative, rehabilitation, and employment director offices are maintained in the Legionowned building at 1608 K St., N.W., Washington, D.C.

The American Legion has two national publications, The American Legion Magazine and The National Legionnaire, with combined circulations in excess of 2,500,000, as well as approximately 300 weekly, semimonthly, and monthly State, district, county, and post news organs.

ANDAMAN AND NICOBAR ISLANDS. A province of British India consisting of two groups of islands in the Bay of Bengal: (1) Andaman Islands (2,508 sq. mi.; pop. 21,483 on Apr. 1, 1941), about 120 miles south of Burma; (2) Nicobar Islands (635 sq. mi.; pop. 13,000 on Apr. 1, 1941), south of the Andaman Islands. Total area, 3,143 square miles. Total population (Apr. 1, 1941), 34,483. Capital, Port Blair. There are good harbors at Port Cornwallis, Bonington, and Nankaurl. The principal products are timber and coconuts.

The islands were occupied by Japanese forces on Mar. 23, 1942, the British having previously withdrawn to the Indian mainland. Port Blair and other points held by the Japanese were attacked by British and American bombers at intervals during 1942

and 1943.

ANDARTES. See GREECE under History.

ANDORRA. A small republic in the Pyrénées between France and Spain, under the joint suzerainty of the French chief executive and the Spanish Bishop of Urgel. Area, 191 square miles; population, about 6,000. Capital town, Andorra. The language spoken is Catalan. Sheep rearing is the main occupation of the people. There is a governing body called the council-general consisting of 24 members (12 elected every 2 years). The council-general nominates the First Syndic (President) and Second Syndic (Vice-President). In a decree published

Sept. 24, 1940, Marshal Henri Philippe Pétain, French Chief of State, assumed the title "co-prince of Andorra" formerly held by the President of the French Republic. In line with anti-democratic trends in France and Spain, universal suffrage was abolished in 1941 and electoral rights restricted to heads of families. When the German Army occupied southern France in mid-November, 1942, the troops arriving at the Andorran frontier announced that they had received orders to respect the integrity of the little republic.

ANESTHESIA. See MEDICINE.
ANGLO-AMERICAN CARIBBEAN COMMISSION. See
CARIBBEAN COMMISSION.

ANGLO-EGYPTIAN SUDAN. A British-Egyptian condominium in northeast Africa. Area, 969,600 square miles; estimated population, 6,342,477 including 53,625 nonnatives. Chief towns: Khartoum (capital) 44,950 inhabitants, Omdurman 116,196, Khartoum North 91,530, Atbara 19,757, Port Sudan 18,554, and El Obeid 17,300.

Production and Trade. Cotton (49,600 metric tons of ginned cotton and 89,300 metric tons of cotton-seed produced during 1940–41) and gum arabic (80 per cent of world's supply) are the principal export products. The chief grain crops are great millet (the staple food of the Sudanese) and bulrush millet. Other products: sesamum, groundnuts, dates, vegetable ivory, mahogany, ghee, shea nuts, salt, and gold. Livestock (1938): 2,700,000 cattle, 2,500,000 sheep, 2,000,000 goats, 420,000 camels, 75,850 asses, and 23,000 horses. Trade (1941): There was a large increase in imports, part of which was transit trade. Exports rose to the record high of £E8,500,000 of which larger shipments of cotton to Great Britain and India and the supply of livestock to Egypt accounted for most of the increase over 1940. The exchange (free rate) of the £E(gyptian) averaged \$4.135 for 1941.

Communications. In 1942 two new roads linked the provinces of Darfur and Bahr el Ghazal with the seaport of Duala, French Equatorial Africa. A military railway from the Sudan to Eritrea was under construction during 1942. At the end of 1940 there were 14,240 miles of roads, 1,991 route miles (3.5 ft. gauge) of railway, 2,325 route miles of river transport, 5,854 miles of telephone and telegraph routes, and 23 wireless stations. Shipping (1938): 746.591 tons entered and cleared Port Sudan.

746,591 tons entered and cleared Port Sudan.
Finance. Budget (1941–42): revenue £E4,066,172, expenditure £E4,639,184. Important features of this budget were the withdrawal of the Egyptian subsidy, and the extension of financial assistance by the British government for the Sudan Defense Force. Public debt (1939) U.S. \$33,580,463.

Government. The Governor General is appointed by Egypt with the assent of Great Britain (Anglo-Egyptian Convention of 1899; reaffirmed by the Anglo-Egyptian Treaty of 1936). Ordinances, laws, and regulations are made by the Governor General in council. Governor General, Lieut. Gen. Sir Hubert Huddleston (appointed Oct. 16, 1940).

ANGLO-IRANIAN OIL COMPANY. See IRAN under History.

ANGOLA (Portuguese West Africa). Area, 488,000 square miles. Population (1940), 3,738,010 (3,665,829 natives, 44,083 Europeans, 28,305 half-castes, and 63 others). Chief towns: Nova Lisboa (capital), Loanda, Benguela, Mossamedes, Lobita, and Malange. Education: 73 primary, 2 secondary, and 13 professional schools.

Property of Am-Rus Music Corp., N.Y.

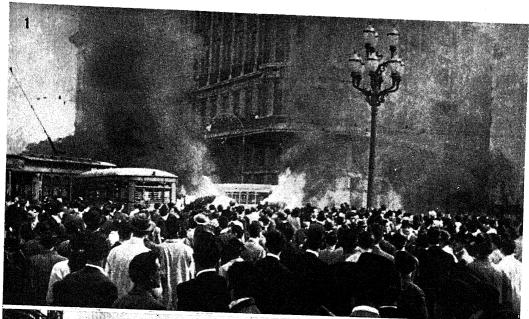

## ANTHEM OF THE SOVIET UNION

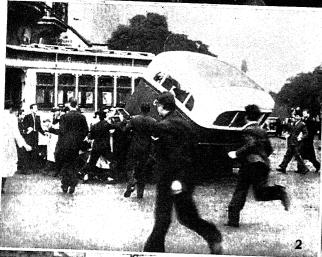

(For translation see the accompanying article "Anthem.")

## A MILLION-DOLLAR MANUSCRIPT

The manuscript of Arturo Toscanini's arrangement of "The Star Spangled Banner" was sold for \$1,000,000 at a War Bond auction held on April 25 by the National Broadcasting Company Symphony Orchestra.

# REVOLT IN ARGENTINA

Although the revolution which overthrew the Castillo government was almost bloodless, street mobs (1–2) in Buenos Aires let off steam by overturning trucks and burning them. 3. Gen. Pedro Pablo Ramírez, who succeeded Ramón S. Castillo as President. 4. Disorder in Capital is quelled.

Production and Trade. Maize (316,800 metric tons produced in 1938–39), manioc (301,590 short tons in 1939), sugar (equal to 40,600 tons refined, 1940–41), coffee (20,000 tons, 1940–41), wheat (12,000 tons, 1940–41), palm oil (5,000 tons exported in 1940), were the chief crop products. Other crops were sisal, cacao, cotton, coconuts, and tobacco. Minerals produced included diamonds, salt, copper, and lignite. Trade (1941): imports 233,205,000 angolares (textiles, coal, and foodstuffs were the main items); exports 434,011,000 angolares (diamonds, coffee, maize, sugar, and wax were the principal items). The angolar averaged \$0.0400 for 1941.

Communications. There were 1,442 miles of railway open for traffic, 22,708 miles of good roads, 20,713 miles of secondary roads, 8,112 miles of telegraph lines, 3,501 miles of telephone lines, and

12 wireless stations.

Government. The ordinary budget for 1942 balanced at 262,525,303 angolares. Public debt (Dec. 31, 1941), 1,049,303,248 angolares, including 836,228,873 angolares owed to Portugal. Angola consists of 5 provinces and 14 administrative districts. The government is headed by a governor general and he is assisted by an advisory council of appointed and ex officio members in addition to members elected by economic organizations. All legislative measures must be referred to the advisory council. Governor General, Comm. Alvaro de Freitas Morna.

ANTHEM, Russian National. The Soviet Union officially adopted a new national anthem in 1943 (see U.S.R. under *History*). It was announced that the "Internationale" would continue to be used as a workers' song. The words of the new anthem were written by Sergei Mikhalkoff and E. L. Gistan. The following is a translation by the American poet Louis Untermeyer.

## HYMN OF THE SOVIET UNION

Republic forever, the land of the free, Joined in love and in labor for all men to see; Long live mighty Russia, the union supreme As the hope of the people, their work and their dream.

Chorus:
Long may she live, our motherland,
Long may her flag be over us;
Flag of the Soviets, our trust and our pride,
Ride through the storm victorious.
Lead us to visions glorious.—
Flag of a people in friendship allied.

(Repeat)

Through terror and darkness the sun shines today, For Lenin and Stalin have lighted the way; We crushed the invader, we hurled back the foe, And our armies in triumph will sing as they go:

Chorus:

Long may she live, our motherland, etc.

ANTI-FREEZE MIXTURES. See National Bureau of Standards.

ANTIGUA. An island presidency of the British Leeward Islands. Area, 171 square miles, including its dependent islands (Barbuda and Redonda, 63 sq. mi.). Total population (1941), 39,036. St. John (10,000 inhabitants), the capital of Antigua, is the seat of government of the Leeward Islands. The chief products are sugar (21,979 tons, 1942) and cotton. Trade (1941): imports £326,483; exports £266,535. Finance (1941): revenue £161,-162; expenditure £133,111; public debt £75,810. Antigua, in addition to representation in the federal legislative council of the Leeward Islands, has a local government consisting of an executive council (presided over by the governor) and a legislative council (presided over by the administrator) of 11 members. Administrator, H. Boon (appointed Apr. 2, 1940).

United States naval and seaplane bases were established in Parham Harbor and along the shore-line of Judge's Bay. The base sites, leased for 99 years, were approved by the Antigua legislative council on Dec. 20, 1940, and confirmed in a formal treaty signed in London, Mar. 27, 1941, by the British and U.S. Governments (see 1943 Year

Воок, р. 33).

ANTIMONY. Although the United States has always leaned heavily upon imports for its antimony requirements, domestic deposits constitute a bulwark available in case of necessity.

The supply and demand for antimony, so far as the United States is concerned, is shown in the ad-

joining War Production Board table.

ANTIMONY SUPPLY AND DEMAND 1943-44

|  | (Contained Antimony)<br>1943 1944 (Est. |                             |  |

| Total Demand Reserve, December 31                                |   | 36,500<br>28,840            |  |

Consumption rose sharply early in 1943. For the first seven months, 4,896 short tons were consumed in the United States compared to 2,742 short tons in the last seven months of 1942. This increased use is at least in part attributable to the need for large quantities of antimony oxide for the manufacture of flameproofing compounds. Its other big use, in alloys, results from two properties: (1) hardness when antimony is alloyed with lead, or lead and tin, it imparts hardness and reduces ductility; (2) expansion on cooling. As a lead hardener, antimony finds its way into electric cable jacketing and lead plates of storage batteries, which would tend to stretch, sag, and buckle were not antimony added. A better known use, as an alloy for type metal, comes from its ability to prevent type slugs from contracting upon cooling, thus blurring the type outline. The crystalline structure characteristic of antimony produces desirable characteristics in bearing metals, such as babbitt, in addition to imparting hardness. It also goes into several specialized alloys with lead, tin, copper, and nickel.

The entire output of Bolivian ore, the world's principal source of supply, went to the United States in 1943, as did the ore mined in Mexico, second largest world producer. China, the former world leader, has little hope of regaining its markets in the postwar period. In the United States, the Yellow Pine Mine of central Idaho, known principally as a tungsten bonanza, mined the most antimony ore. Other domestic production comes from the Sunshine Mine and the Coeur d'Alene Mines Corp. in the Idaho panhandle, and in lesser amounts from California, Nevada, Arizona, and Alaska.

Texas Mining & Smelting Co. at Laredo, accounts for approximately 90 per cent of total metal output. Antimony metal usually is marketed in units 10 in. by 10 in. by 2½ in., variously known as blocks, bars, and pigs. Average weight is about 55 lb. to the bar. On December 4, the Office of Price Administration translated the existing ceiling of 14 cents per lb., f.o.b. Laredo, for 99.0 per cent metal, which prior to the General Maximum Price Regulation had been set by voluntary agreement, into Maximum Price Regulation 497, also blanketing in 15 antimony compounds. WPB released antimony from allocation Jan. 1, 1944.

CHARLES T. POST.

ANTITRUST DIVISION. A Division of the U.S. Department of Justice which enforces the antitrust laws of the United States and handles legal proceedings connected with some 30 other major Acts of Congress involving the regulation of business activity. Under an arrangement with the Board of Economic Warfare, the Division in 1943 conducted investigations and made reports on industrial and economic conditions bearing on the military situa-tion. The Small Business Section received complaints and appeals from small business concerns and, when justified, represented their interests before other government agencies. Assistant Attorney General Wendell Berge is in charge of the Division. For antitrust actions in 1943, see Law: Music; NEWSPAPERS.

APPROPRIATIONS. See Public Finance; United STATES under Congress; countries under History; also the subject, as LEND-LEASE, NAVAL PROGRESS.

AQUEDUCTS. City water supply systems are becoming a wider field for aqueduct construction, since more and more of them have to seek new and more distant sources. In most cases such aqueducts are of the pipeline type, but tunnels and other works are included. The 85-mile Delaware River aqueduct tunnel, at New York, is noted under WATER SUPPLY AND PURIFICATION. Other examples are Baltimore, with a conduit to the Patapsco River and another 12 miles across the city, and Wilmington, N.C., with an 8-mile or 30-mile conduit, according to alternative plans. Salt Lake City is to have a 40-mile aqueduct for domestic, industrial, and irrigation service, its population having been increased 50 per cent by military and industrial activities. Work was ordered stopped in December, 1942, by the WPB, but resumed in October, 1943, for laying 2½ miles of 69-in. concrete pipe. Of the 40-mile length, nine miles are completed completed.

Similar projects are covered in many postwar plans. Surface aqueducts (canals and pipelines), being conspicuous from airplanes, have a new hazard in the development of aerial bombing. Experiments are being made to partially conceal them in emergency by smoke screens; or permanently,

in the case of pipelines, by camouflage painting in colors harmonizing with the surroundings (and therefore changed with the seasons) or by covering some portions with earth.

Of aqueducts in the irrigation and hydraulic projects of the U.S. Bureau of Reclamation, the following may be noted, in addition to the Salt Lake City aqueduct mentioned above. Those marked (\*) are still under construction; the others are halted by order of the War Production Board.

(1) Colorado—Big Thompson project,\* Colorado, with 11 miles completed on the 13-mile Continental Divide

11 miles completed on the 13-mile Continental Divide tunnel.
(2) Provo River project, Utah, with 2¾ miles completed on the 6-mile Duchesne tunnel.
(3) Madera 37-mile canal \* on the Central Valley project, California; 8 miles completed and 29 miles under contract.
(4) Enlarging 22 miles of the Provo Reservoir canal,\* Utah; to be completed in 1945.
(5) Heart Mountain canal, 28 miles, on the Shoshone project, Wyoming; completed in 1943.
(6) Casper main canal, 62½ miles, on the Kendrick project, Wyoming; nearly completed but work stopped.
(7) Pilot canal, 38 miles, Riverton project, Wyoming; nearly completed.

(7) Phot canal, 38 miles, Kiverton project, Wyoming; nearly completed.
(8) Enlarging the 9-mile Weber-Provo diversion canal,\* on the Provo River project, Utah.
(9) Roza main canal,\* 95 miles, on the Roza division of the Yakima project, Washington; 59 miles completed.
(10) Coachella branch,\* 130 miles, of the All-American canal, California; 86 miles completed and 27 miles in progress.

In South Australia, a 240-mile pipeline is reported under construction to supply water from the Snowy River for domestic, industrial, and irrigation purposes in the Whyalla district on Spencer Gulf. Several projects of this type, involving dams and aqueducts, are in prospect for postwar de-velopments in Australia and Africa.

Of numerous pipeline aqueducts for the transport of crude oil, refined products, gasoline, and natural gas, a conspicuous example is that under construction in Canada by the U.S. Army, from wells at Fort Norman to Whitehorse, on the Alaska Highway, 600 miles, to serve airports and defense stations in Alaska. Pipe, machinery, and equipment were carried 800 miles by barge and portages from were carried 800 miles by barge and portages from Fort Smith on Great Slave Lake, to Fort Norman, on the Slave River. The noted "Big Inch" 24-in. pipeline from Longview, Texas, to the Atlantic coast, was completed to Phoenixville, Pa., on July 19. Thence two 20-in. lines diverge to Marcus Hook, Philadelphia, and Bayonne, N.J., on New York harbor, making a total length of nearly 1,400 miles

miles. In the 24-in. line, with 25 pumping stations, the rate of oil flow is about 4 miles an hour, reduced to 3 miles in the smaller branches. Smaller lines paralleling the "Big Inch" from Texas to tank-car loading stations in Illinois and Indiana, 840 miles, were under construction, with prospects of extension to the Atlantic coast. The government concern called the War Emergency Pipe Lines, Inc., completed ten of its projects and had others under way. The line across Florida, from Carabelle to Jacksonville, 185 miles, was completed in January, connecting tank barge services on the Gulf and Atlantic intracoastal waterways. A short line connecting two older lines completed a new route from the mid-west to the Atlantic coast. The line from Baton Rouge to Greensboro, N.C., was extended to Richmond, Va., 175 miles, in June, in order to deliver oil to barges serving the New England states. A proposed line from Albany to Boston was disapproved by the U.S. Government as unnecessary.

Some pipelines were under way for natural gas, which differs from oil in that it must be kept confined under pressure in its transport from the wells to the consumer. Nevertheless, the transportation distance is increasing. In October, 1943, a contract was let for a 1,200-mile natural-gas line from Corpus Christi, Texas, to Cornwell, W.Va. An 82-mile line was built in Ohio on account of the decline in natural-gas supply in the Akron industrial district. An unusual development in pipeline construction was the carrying of pipe in suspension spans up to 1,000 ft. in length, thus saving nearly ten miles of surface construction in rough country. Record-breaking speed was made in the construction of some main pipelines, but strikes caused considerable delays on other lines. See WATER SUPPLY and DAMS.

E. E. RUSSELL TRATMAN.

ARAB FEDERATION. See EGYPT and IRAQ under History.

ARABIA. A large peninsula in southwestern Asia. Area, 1,000,000 square miles; population, said to be 10,000,000. For the various divisions of Arabia see below. Arab countries outside the Arabian peninsula are presented in the separate articles on EGYPT, IRAQ, PALESTINE, SYRIA AND LEBANON, and

Trans-Jordan.

Aden. A British crown colony at the southern tip of Arabia, about 100 miles east of the Red Sea. Included in the colony is the island of Perim (5 sq. mi.; pop., 2,346) in the southern entrance to the Red Sea. Total area, 80 square miles; total population (1931), 48,338, excluding the military forces. Chief towns: Aden (capital), 32,490 inhabitants (1931 census); Sheikh Othman, 12,167. Education (1941): 69 schools and 3,200 students. Aden has a fortified naval base, a free port, and is a fueling station for ships. Early in 1940 the port was made a contraband control port for shipping. The transit trade is important. Local products are salt, soap, cigarettes, dhows, and cured fish. Trade (1939): Rs68,566,887 for imports and Rs39,095,919 for exports (rupee averaged \$0.3328 for 1939; \$0.3016, 1940; \$0.3014, 1941). During 1939 the merchant shipping that entered the port totaled 8,005,764 net tons. Finance (1941–42): Rs4,671,758; expenditure Rs3,953,932. Aden became the colony of Aden on Apr. 1, 1937. The government is administered by a governor, aided by an executive council. Governor and Commander in Chief, Sir John H. Hall (appointed Oct. 24, 1940).

Hall (appointed Oct. 24, 1940).

Aden Protectorate. The region in southern Arabia extending east, north, and west of the colony of Aden. Area, 112,000 square miles; estimated population, 600,000, mostly Arabs. It is divided into two parts: (1) Western Aden Protectorate, comprising 19 sultanates of which the premier chief is the Sultan of Lahej. (2) Eastern Aden Protectorate, comprising the Hadhramaut (made up of the Qu'aiti State of Shihr and Mukalla, and the Kathiri State of Seiyun), the Mahri sultanate of Qishn and Socotra, the Wahidi sultanates of Bir'Ali and Bilihaf, and the sheikdoms of 'Irqa and Haura. The Sultan of Qishn and Socotra resides on the island of Socotra (1,400 sq. mi.; pop., 12,000; chief village, Tamarida), 150 miles from Cape Guardafui, Africa. Dates, gums, tobacco, and butter are the main products. There are large numbers of sheep, cattle, and goats. The local rulers have protective treaty relations with Great Britain and manage their own affairs subject to general supervision by British officials who are under the control of the

governor of Aden.

Bahrein Islands. The chief islands of this state in the Persian Gulf are Bahrein, Muharraq, Nebi Saleh, and Sitra. Total area, 231 square miles; population, 120,000, of whom 75 per cent belong to

the Shia sect, and the remainder to the Sunnis. Capital, Manama (25,000 inhabitants) on the island of Bahrein, is joined to the town of Muharraq (25,000 inhabitants) by a causeway. Chief products: pearls, crude petroleum (936,000 metric tons in 1941), boats, sailcloth, reed mats, and dates. Fine white donkeys are raised. Trade (1939–40): Rs22,159,030 for imports and Rs12,976,230 for exports (excluding petroleum). The rupee averaged \$0.3014 in 1941; \$0.3016, 1940; \$0.3328, 1939. Ruler (since Feb. 3, 1942), Sheik Sulman (in treaty relations with Great Britain).

Kuwait (Koweit). An Arab state south of Iraq. Area, 1,930 square miles; population, 60,000, exclusive of some Bedouins. Capital, Kuwait. Pearls, wool, dhows, and horses are exported. Trade (1937–38): imports Rs5,477,488; exports Rs2,320,075 (rupee averaged \$0.3659 for 1938; \$0.3733 for 1937). Oil was discovered during 1938. Kuwait is in treaty relations with Great Britain, which is represented by a political agent. Ruler, Sheik Sir Ahmed ibn Jabir al Subah (succeeded Feb. 23,

1921)

Muscat and Oman. An independent sultanate in southeastern Arabia. Area, 82,000 square miles; estimated population, 500,000, mainly Arabs, but there is a strong infusion of Negro blood near the coast. Chief towns: Muscat, the capital, 4,200 inhabitants; Matrah, 8,500. On the northern coast of the Gulf of Oman is the port of Gwadur which is a possession of the sultanate. Chief products: dates, pomegranates, limes, and dried fish. Camels are raised by the inland tribes. Trade (1938–39): imports Rs4,876,193; exports Rs3,331,939. Muscat is the only port of call for steamers. Pack animals are used for inland transport. There is a motor road connecting Muscat and Matrah and extending to Kalba. Roads suitable for motor vehicles join Hagar, Bosher, and Qariyat with Matrah. The annual revenue is estimated at Rs700,000. A new treaty of friendship, commerce, and navigation was signed with Great Britain on Feb. 5, 1939. Sultan, Sir Saiyid Said bin Taimur (succeeded Feb. 10, 1932).

Oman, Trucial. The Arab states (Abu Dhabi, Ajman, Debai, Shargah, Ras al Khaimah, and Umm ul Qawain) on the Persian Gulf. Area, 6,023 square miles; population, 75,000 to 85,000. Chief capital, Abu Dhabi. Pearls are the chief export from the coast ports. The rulers of the six states are in treaty relations with Great Britain, which is represented by a resident agent who is under the control of the British political resident at Bushire, Persia.

Qutur. An Arabian sheikdom occupying a peninsula in the Persian Gulf. Area, 8,500 square miles; population, 25,000. Capital, El Beda. Relations with Great Britain are regulated by the Treaty of Nov. 3, 1916. Sheik, Abdullah ibn Jasim al Thani (acceded

in 1913).

Saudi Arabia. An Arab state occupying the northern and central part of Arabia, formerly known as the Kingdom of Hejaz and Nejd. Pending the introduction of a single constitution for the whole country, there are two systems of government—one for Nejd and one for Hejaz. Ruler, King Abdul Aziz ibn Abdur Rahman al Faisal al Saud.

Nejd occupies a large part of central Arabia, including the Nafud and Dahna deserts, and reaches eastward to the Persian Gulf. Area (estimated), 550,000 square miles. Population (estimated), 3,000,000. Chief towns: Riyadh (capital), Hufuf, Mubarraz, Shaqra, Anaiza, Buraida, Hail, Jauf, Sakaka, and Hauta. Chief products: dates, wheat, barley, fruit; hides, wool, clarified butter, Arab cloaks, and crude petroleum (804,000 metric tons

in 1941). Large numbers of camels, horses, donkeys, and sheep are raised. Trade: imports include piece goods, sugar, coffee, tea, rice, and motor vehicles; exports, except for petroleum, are very small. Nejd is governed in a patriarchal manner by the King whose eldest son (Emir Saud), the heir apparent, acts as Viceroy and Commander-in-Chief of the military forces.

Hejaz extends along the western coast from Trans-Jordan to Asir. Area, 150,000 square miles; population (estimated), 1,500,000. Chief towns: Mecca, the capital and holy city of Islam, 80,000 inhabitants; Jidda, the seaport for Mecca, 40,000; Medina, the site of Mohammed's tomb, 20,000; Yenbo, the seaport for Medina. Chief products: dates, butter, honey, fruit, wool, and hides. The analysis of the seaport for Medina. nual pilgrimage of Moslems from abroad to Mecca and Medina is the chief source of income. Hejaz is governed under the constitution of Aug. 26, 1926, and later amendments. There is a council of ministers presided over by the King's second son, Emir Faisal, who is minister of foreign affairs, and Viceroy during the King's absence.

Asir, a province south of the Hejaz, was incorporated in the kingdom of Saudi Arabia during 1933. Area, 14,000. Population (estimated), 750,000. Capital, Sabiya, 20,000 inhabitants.

Yemen. An independent Arab kingdom in southwestern Arabia. Area, 75,000 square miles; population, 8,500,000. Chief towns: San'a (capital), 25,000 inhabitants, Hodeida, 40,000, Taizz, Ibb, Yerim, Dhamar, Mocha, Loheiya. Chief products: coffee, barley, wheat, millet, and hides. Ruler, Imam Yahya b. Muhammed b. Hamid el Din.

#### HISTORY

The policy of benevolent neutrality toward Great Britain and her allies adopted by King Abdul Aziz Ibn Saud of Saudi Arabia during the critical period of World War II strengthened his position as the dominant figure in the Arab world when the war turned against the Axis. This enabled Ibn Saud in 1943 to intervene more actively in the two major issues confronting the Arab peoples. He assumed a leading role in the movement for the federation of the Arab states, and he came out strongly in opposition to the Zionist campaign for a Jewish national state in Palestine

(which see).

Ibn Saud's opposition to the Zionist program and his warning that it would "inevitably lead to more trouble" were set forth in a formal statement to a representative of Life Magazine at Riyadh on Mar. 21, 1943. In the same interview he expressed his belief that with Allied aid the Arabs would be united after the war. The latter project offered the King an opportunity to extend his power far outside the boundaries of his desert domain. However other ambitious Arab leaders-Premier Nahas Pasha of Egypt, Emir Abdullah of Trans-Jordan, and Premier Nuri es-Said of Iraq—were seeking to gain control of the federation movement. Ibn Saud sent agents and observers to the other Arab states to keep abreast of developments. In October he dispatched his private secretary and his acting Foreign Minister to Cairo to discuss federation with Nahas Pasha. According to the Egyptian press, Ibn Saud's delegates demanded that the Arab leaders press for an immediate solution of the Palestine question, while Nahas Pasha considered it inadvisable to force a show-down on the issue until after the war. Meanwhile Ibn Saud's political influence had been increased fur-ther by the election of his close friend, Shukri Quwatly, as president of the Syrian Republic.

A year after Ibn Saud severed diplomatic relations with Italy, the Imam Yahya of Yemen late in February, 1943, was reported to have ordered the internment of all Italians and Germans in his domains for the duration of the war. It was announced October 16 that the British and Saudi Arabian governments had renewed the Treaty of Jidda for seven years. This treaty, signed in 1927, recognized Saudi Arabia's full independence, pledged both parties to prevent their territories from being used as bases for hostile activities against each other, and bound Ibn Saud to maintain peaceful relations with the small Arab states

on the Persian Gulf under British protection.

The official visit made to Ibn Saud's capital at Riyadh in 1942 by Alexander Kirk, U.S. Minister to Egypt and Saudi Arabia, was followed on Apr. 19, 1943, by President Roosevelt's action in authorizing the extension of lend-lease aid to Saudi Arabia. In May James S. Moose Jr. was appointed as the first U.S. Minister to be permanently stationed in Arabia. In October Emir Faisal, Ibn Saud's second son and Foreign Minister, visited the United States as guest of the U.S. Government, accompanied by his brother, Emir Khalid, and the Saudi Arabian Minister to London. During their presence in Washington it was revealed that the U.S. Petroleum Reserves Corporation, a Federal agency, was negotiating with the California Arabian Standard Oil Company for a participating interest in the development of the company's vast oil reserves in Saudi Arabia. Brig. Gen. Patrick J. Hurley had visited Saudi Arabia the previous spring as President Roosevelt's representative to study the growing American oil industry centered at Dhahran on the Persian Gulf coast. He was said to have arranged for Emir Faisal's visit. According to some oil experts, the American oil concessions in Saudi Arabia contained very large potential

U.S. lend-lease aid to Saudi Arabia took the form of pumping machinery for the expansion of irrigation projects. A thousand acres of arid land at El Kharj, 54 miles south of Riyadh, were placed under cultivation with American pumping machinery and with the advice and assistance of the U.S. agricultural mission which visited Saudi Arabia in 1942. Other projects were under development in line with Ibn Saud's program for the permanent settlement of the nomadic tribesmen on irrigated lands. The program was spurred by the great reduction of food imports caused by the war and especially the cutting off of the country's major source of income—the Moslem pilgrimages to the holy cities of Mecca and Medina.

Failure of the crops in Aden Protectorate led the Governor of Aden in June to request 20,000 tons of millet and £30,000 for famine relief during the ensuing twelve months. The Middle East Supply Center in Cairo arranged to supply the millet.

ARABS. See Algeria, Egypt, France, and Tunisia under History.

**ARCHAEOLOGY.** It is astonishing that anything can be reported in the way of archaeological discovery. It is however possible to record that Dr. Nelson Clueck, who is director of the American School of Oriental Research at Jerusalem, has been able to conduct excavations in the valley of the Jordan which brought to light the ruins of some 70 villages dating from the middle of the 4th millennium B.C. down to the 12th century of the Christian era. The results of these explorations reveal that between the 13th and the 6th centuries before Christ there were about 35 villages distributed over some 35 miles of the eastern side of the valley of the Jordan. So far as can be made out the population of this area ran to 35,000 or 40,000 people. Evidence was gathered which confirms the statement in Genesis XIII, 10, "And Lot lifted up his eyes, and beheld all the plain of Jordan, that it was well watered everywhere, before the Lord destroyed Sodom and Gomorrah."

At a place in Iraq, known as Aqer Quf, 18 miles to the west of Baghdad, the Iraq Department of Antiquities conducted excavations in the great mound. The season's work resulted in the clearing out of 12 rooms of a temple in which were found five inscribed pivot stones together with a number of inscribed tablets. These finds supply additional information in reference to a previously uncertain period in the history of Mesopotamia. From the material recovered it is now possible to identify Kurigalzen as the third king bearing that name and to establish the fact that he ruled Mesopotamia for a period of 20 years after Tutankhamen of Egypt had died. Signs of fire suggest the possibility that at a later date the place was burned by the Assyrians.

Coming to America, excavations conducted in preparing the approaches for the Ochomozo bridge of the Inter-American Highway near Rivas in Nicaragua, have brought to light idols, grinding stones, and vase fragments dating in the time of Early Central American Culture. Near Arequipa, in Peru, have been found the ruins of a pre-Inca city. Here, on a mountain 13,000 feet in height, the explorers found remains of streets and public squares. At a depth of some five feet many fragments of pottery mortars came to light. The discovery of well-preserved remains of stone mortars dates the place as pre-Inca, inasmuch as the Incas did not use such mortars.

OLIVER S. TONKS.

ARCHITECTURE. This article has been suspended pending the resumption of non-war construction. AREAS, Bureau of. See FOREIGN ECONOMIC ADMINISTRATION.

ARGENTINA. A federal republic of South America, consisting of 14 provinces, 10 territories, and the federal district, which includes the capital, Buenos Aires.

Area and Population. Land area, 1,079,965 square miles. Estimated population, 13,709,238 in 1942 (7,885,237 at 1914 census). Estimated populations of chief cities in 1942 were: Buenos Aires, 2,408,900; Rosario, 518,515; Avellaneda, 245,301 (1940); Córdoba, 273,852 (1940); La Plata, 199,904 (1940); Tucumán, 149,214 (1941); Santa Fé, 150,634; Bahia Blanca, 115,016 (1940); Mendoza, 102,129. The population is almost entirely of European (chiefly Spanish and Italian) extraction, except for about 400,000 persons of Indian and mixed descent. About 77.4 per cent are Argentine-born. The foreign population in 1941 totaled about 2,500,000, of whom some 779,000 were Italians, an almost equal number Spaniards, and about 236,756 Germans. Living births in 1941 numbered 304,062 (23.9 per 1,000); deaths, 136,050 (10.7 per 1,000); immigrants by sea, 12,132 (2,648 from Spain).

Defense. As of Jan. 1, 1941, Argentina had an estimated 49,705 men in active army service, including conscripts; an additional 2,023 men in the military and naval air forces, with about 272 planes; a trained army reserve of 282,503 men; and

a naval force of 2 old battleships (recently modernized), 3 cruisers, 4 old coast defense vessels, 15 destroyers, 3 submarines, 14 mine-sweepers, and various auxiliary craft.

Education and Religion. Illiteracy fell from 22 per cent of the voting population in 1930 to an estimated 16 per cent in 1939 (less than 2 per cent in the federal district). Educational statistics: Primary, 14,241 schools with 2,024,954 pupils in 1941; secondary, 916 schools with 184,057 pupils in 1942; universities, six with 39,595 students in 1941. The Roman Catholic Church is supported by the state; all other faiths enjoy freedom of conscience

Production. Agriculture, stock raising, and manufacturing are the principal occupations. Before the war, agricultural and pastoral products normally accounted for more than 90 per cent of all exports. Yields of the chief crops were (metric tons): Wheat, 5,400,000 in 1942–43; linseed, 1,500,400 in 1942–43; corn, 1,900,000 (estimated) in 1942–43; rice, 107,750 in 1942–43; cotton, 80,869 in 1941–42; barley, 789,000 in 1941–42; oats, 700,600 in 1942–43; potatoes, 1,056,000 in 1941–42; cane sugar, 405,825 in 1941. The 1942 wine output was 6,916,410 hectoliters (hectoliter equals 26.42 U.S. gal.); maté, 158,998,000 lb. in 1941.

Beef cattle slaughtered at frigorificos (packing plants) during 1942 numbered 3,284,217 (3,552,-260 in 1941) and exports of fresh, boneless, and canned beef totaled 740,234 metric tons on a freshbeef basis (775,112 tons in 1941). The number of swine marketed in 1942 was 2,089,000 (1,411,300 in 1941) and exports of pork products were 83,373 metric tons (41,541 in 1941). Sheep slaughtered in frigorificos in 1941 numbered 5,481,050. Output of dairy products in 1942 (metric tons): Butter, 41,228; cheese, 58,744; casein, 25,632. Industrial establishments in 1941 employed 785,000 persons and produced goods valued at 5,230,000,000 pesos. Meat, textiles, flour, tobacco goods, edible oils, and alcoholic beverages are the leading industrial products. Stone, ores, and minerals produced in 1941 were valued at \$183,000,000. State-owned fields produced 15,382,736 bbl. of oil, the leading mineral product, in 1942.

Foreign Trade. Imports in 1942 were valued at 1,274,148,529 paper pesos (1,276,654,533 in 1941); exports, 1,782,982,579 pesos (1,464,621,550 in 1941). The metric tonnage of 1942 imports was 4,515,461 (6,472,543 in 1941); of exports, 5,303,430 tons (6,241,313 in 1941). Of the 1942 exports, pastoral products accounted for 1,081,124,831 paper pesos and agricultural products for 384,709,508 paper pesos. Leading imports were textiles, chemicals, fuels, wood, paper, metals, iron and their various products, machinery and vehicles, foodstuffs, etc. The United States supplied 31.2 per cent of Argentina's 1942 imports, United Kingdom 18.2, Brazil 17.8, and Sweden 7.6 per cent. Of the exports, the United Kingdom took 32.7 per cent, United States 28.3, Brazil 5.9, and Sweden 4.4 per cent.

Finance. Budget estimates for the calendar year 1943 placed receipts (excluding loans) at 1,014,000,000 paper pesos (964,000,000 in 1942) and total expenditures (including debt redemption) at 1,204,000,000 pesos (1,217,000,000 in 1942). The defense budget totaled 232,000,000 pesos for 1942 and 246,000,000 for 1943. In 1941 actual non-loan receipts were 910,000,000 pesos and expenditures 1,367,000,000. The Federal debt totaled 5,499,-719,000 pesos on June 30, 1941. The free market exchange rate for the paper peso was \$0.2288 in 1940. \$0.2361 in 1941, and \$0.2364 in 1942.

Transportation. Argentina in 1942 had 26,184 miles of railway lines (59 per cent British-owned and 30 per cent state-owned), 253,115 miles of highways (about 10 per cent all-weather motor roads), and nine foreign and domestic air lines providing connections among all the principal cities of Argentina and the Western Hemisphere. A new railway from Salta, Argentina, across the Andes to Antofagasta, Chile, was under construction in 1942–43. Statistics of civil air traffic in 1942: Kilometers flown, 2,247,335; passengers, 55,014; mail, 78,968 kilograms; express, 210,518 kilograms. The net registered tonnage of vessels entering Argentine ports was 6,690,000 in 1940 and 4,638,262 in 1941.

Government. The Constitution of 1853 vests executive power in a president chosen for a six-year term by 376 electors representing the provinces and the federal district. It provided for a National Congress consisting of a Senate of 30 members elected for nine years by the provincial legislatures and a Chamber of Deputies of 158 members elected for four years by universal male suffrage. One-third of the Senate retired every three years and one-half of the Chamber every two years. The governors of the provinces, elected by local suffrage, exercise extensive powers independently of the federal government. The standing of the parties in the Chamber of Deputies elected in March, 1942, was: Government bloc (National Democrats and Antipersonalista Radicals), 68; Radicals, 64; Socialists, 17; others, 9. In the Senate the Government bloc held 24 seats; Radicals, 4; Socialists, 1; others, 1. President at the beginning of 1943, Dr. Ramón S. Casdent at the beginning of 1948, Dr. Ramón S. Casdent at the beginn tillo, the former Vice President. He became Acting President on July 3, 1940, due to the illness of President Roberto M. Ortiz, and succeeded to the Presidency on June 27, 1942, upon the resignation of Ortiz. For 1943 developments, see below.

### HISTORY

Presidential Campaign. The beginning of 1943 found Argentine attention concentrated upon the Presidential election scheduled for September 5. The sudden death on January 11 of ex-President Augustín P. Justo upset all political calculations. General Justo during 1942 had emerged as the leading opponent of President Castillo's isolationist foreign policies and as the chief threat to the perpetuation of his political power (see 1943 Year Book). With Justo's removal from the scene, Castillo had little difficulty in securing the nomination of his own candidate by the Concordancia, or coalition of the conservative National Democratic and Radical Antipersonalist parties, which had controlled the government since 1931.

On February 10 Castillo amounced that he would not seek a second term. A week later he named Dr. Robustiano Patrón Costas, wealthy President of the Senate and a leader of the National Democrats, as his choice for the Presidency. Dr. Patrón Costas, he emphasized, would continue the Castillo policy "as regards both domestic and international affairs." Governor Rodolfo Moreno of Buenos Aires Province, an aspirant for the Concordancia nomination, rebelled at this decision but was unable to carry his political following with him into the opposition and was forced to resign as Governor on April 13. The Concordancia ticket was completed with the announcement by the Radical Antipersonalists on May 16 that they would support Patrón Costas and Manuel María de Iriondo, an Antipersonalist, as candidates for President and Vice President respectively. The Concordancia's platform, published May 31, pledged the candidates to "maintain peace by continuing the pres-

ent international policy" and to "repudiate all extremisms" in domestic politics.

Castillo's stubborn insistence upon his policy of "prudent neutrality" and nonfulfillment of the recommendations for severance of diplomatic and economic relations with the Axis adopted by the Rio de Janeiro Conference of American foreign ministers in January, 1942, loomed as the outstanding issue of the coming election. This policy grew increasingly unpopular, particularly after Chile severed relations with the Axis Powers in January, 1943, leaving Argentina completely isolated among the nations of the New World. However the President overrode criticism within his own party. Using the powers obtained under the state of siege decreed Dec. 16, 1941, he maintained his ban on discussion in the press, the radio, or other media of public information of both international questions and the application of the state of siege.

There was mounting uneasiness at Argentina's diplomatic isolation and, among military circles, at the rapid armament of Brazil and Chile with United States lend-lease aid-denied to Argentina because of her noncooperation. This trend of public sentiment, coupled with the unexpected victory of the opposition Radical party in the Entre Rios provincial election of March 22, pointed to the possible defeat of the Castillo ticket if the Radical, Socialist, and Progressive Democratic parties could unite in an anti-government coalition. The three parties agreed upon a common electoral platform calling for "active solidarity" with the United Nations, defense of the Western Hemisphere's "territorial integrity and . . . democratic institu-tions," and the elimination of electoral fraud, corruption, and monopolies that flourished under the Castillo Government. They also united on the Socialist demand for nationalization of the private petroleum industry, power plants, railways, ports, and telephone system, over which foreign capital had a large measure of control. But while agree-ing that a Radical candidate should head the ticket, the Socialists and Progressive Democrats were unable to get together on a Vice Presidential candidate.

The Military Coup. With the Presidential election only three months away and the opposition parties unable to agree on their candidates, victory for the Concordancia and the continuance of Castillo's foreign and domestic policies seemed assured. At this juncture, four days before the scheduled reconvening of Congress, high army and navy officers executed a military coup on the night of June 3-4 that ousted the Castillo regime. Led by Gen. Pedro P. Ramírez, Castillo's former War Minister, Gen. Arturo Rawson, and Rear Adm. Saba H. Sueyro, the military leaders presented a demand for the President's resignation. He refused and attempted to organize resistance, meanwhile taking refuge on the minesweeper Drummond in the Plata River. With the exception of cadets of the Naval Mechanical School in the city's suburbs, who put up a brief fight, the armed forces and the police made no move to save the regime. Anti-Castillo throngs of civilians greeted the coup with joyous vivas for democracy and liberty. On June 5 Castillo returned to Buenos Aires and resigned. The rebel junta assumed full powers, naming General Rawson as Provisional President. Earlier Rawson had proclaimed martial law throughout the

The circumstances of the revolt and the first statements of the revolutionary leaders aroused widespread expectation in Argentina and abroad that the Castillo policies would be abandoned in favor of active collaboration with the other American republics and the restoration of democratic methods of government at home. The powerful Radical party announced its support of the revolutionary government. However the domestic and foreign policies pursued by the military dictator-

ship soon disabused these hopes

The first shock came with the announcement of the membership of the Rawson Government on June 5. Strongly Rightist military men filled all except two posts in the Cabinet. The two civilian members were extreme reactionaries. Rawson and his associates gave assurances that the Constitution and the rights and freedom of the people would be respected. But on June 6 the dissolution of Congress was decreed—with the promise to form a new Congress at an opportune time—and rigorous suppression of Communist propaganda was ordered.

Ramírez Takes Over. Rawson and the members of his Cabinet were to have been formally inducted into office at noon on June 7. But early that morning he resigned and turned over the Presidential powers to General Ramírez. It developed that Rawson had been forced out by military associates hostile to his policy of breaking relations with the Axis. However the new Cabinet, sworn in with Ramírez that evening, appeared less illiberal and more favorably disposed toward the United Nations. Ramírez immediately issued a statement affirming Argentina's "friendship and loyal cooperation with the other nations of America in conformity with existing pacts." However he added that Argentine policy toward the rest of the world was "for the present, one of neutrality" and that the regime would "tolerate no foreign interference" with regard to its standards of government. Soon afterward the Government sought to remove Rawson from the scene at Buenos Aires by appointing him Ambassador to Brazil.

On June 8 the Ramírez Government ended martial law but continued the state of siege previously in force. The impending Presidential election was called off. A statement that Argentina would "show by acts . . . that she has drawn closer to her sister republics" was followed by a decree prohibiting the use of secret codes in international wireless communications. This was taken as a direct blow to Axis espionage agents in Argentina, and facilitated the prompt recognition of the new government by the United States and the other

United Nations.

Despite these preliminary gestures toward the democracies, the Ramírez Government clung to the Castillo neutrality policies while growing steadily more arbitrary and reactionary in internal mat-ters. Ramírez on June 15 stated that his regime would "hand the country back to its politicians" when it had "cleaned and restored" the nation. Repeatedly thereafter he emphasized that he had no designs against Argentina's democratic Constitution and institutions. Meanwhile the actual measures of his Government assumed an increasingly totalitarian aspect.

The political parties, the newspapers, and the radio were gagged. No public or private meetings "having political aims affecting either domestic or foreign policy" were permitted. Interventors were appointed to replace various provincial governments. Scores of persons suspected of Communist tendencies were arrested and interned in the desolate Neuquen Province of southern Argentina. Any criticism of the regime was forbidden and severely punished. Numerous labor unions were dissolved, along with the Nazi Federation of German Welfare and Cultural Clubs. On the ground that they were tinged with communism, a number of Argentine pro-Allied organizations, including Acción Argentina, were disbanded. Meanwhile pro-Fascist, anti-democratic, and anti-Semitic newspapers and organizations were permitted to carry

on their activities.

Some early actions of the dictatorship won widespread popular support. The former Ministers of Interior and Agriculture were among numerous members of the Castillo regime arrested on charges of corruption or malfeasance in office. Sweeping economic decrees curbed monopolies, checked soaring prices and rising rents, and raised the salaries of laborers and Government employees. A number of foreign-owned public utilities were expropriated while others were arbitrarily forced to reduce their rates.

Friction with United States. Soon after the U.S. Government recognized the Ramírez regime on June 11, the dictatorship proposed the sending of a special mission to Washington for a discussion of political, economic, and military questions. The apparent intention was to obtain U.S. military equipment for the Argentine Army under lendlease in return for the subsequent severance of Argentine diplomatic relations with the Axis Powers. However the State Department made it plain that Argentina could not expect lend-lease assistance until after it had carried out the anti-Axis measures recommended by the Rio Conference.

A diplomatic impasse resulted when the Ramírez Government declined to go beyond the halfhearted gesture taken in curbing Axis diplomatic communications in code. In a July 4 speech be-fore the American Society of the River Plate the Foreign Minister, Vice Adm. Segundo E. Storni, reiterated Argentina's intention to stand by her commitments and "duties of Pan American cooperation." But Washington, insisting on deeds rather than words, did not invite Argentina to the United Nations Conference on Food and Agriculture in July.

On July 31 the Ramírez Government issued unofficially a statement asking United States opinion not to pass "snap judgment" on Argentine policy as that might do irreparable harm to Argentine-American relations. This statement was followed by a decree of August 3 authorizing Argentine ships to violate the German submarine blockade and call at the port of New York. Under an order of July 7, 1942, Argentine shipping had been barred from all United States Atlantic ports.

Subsequent developments reflected a growing coolness in Argentine-American relations. The United States Ambassador went home to report early in August. The Office of Economic Warfare in Washington revoked certain licenses enabling United States exporters to send goods to Argentina. In reply to the warning delivered to neutral nations by the United States, British, and Ca-nadian governments on July 30 against giving refuge to Italian Fascist or German Nazi leaders, the Argentine Government replied September 1 that it would "exercise the faculties that belong to it to decide in each particular case." On September 6 it was announced that the United States and British Governments had protested the arrest in Argentina of British and American officials of the Argentine subsidiary of the American and Foreign Power Co.

Storni-Hull Notes. At this juncture the U.S. State Department on September 8 released a letter addressed to Secretary Hull by Foreign Minister Storni on August 5 and Hull's reply of August 30. The Storni letter denied that either the members of the Ramírez Government or the armed forces were animated by totalitarian ideology or sympa-thy. It declared that, on the contrary, they "base their acts on the firmest democratic convictions." It went on to defend Argentine neutrality as "only theoretical" and as benevolent toward the Allied nations.

Admiral Storni declared that although Argentine sentiment was firmly on the side of the United Nations, the Government could not fulfill its obligation to sever relations with the Axis because (1) the country was "not ready for it," (2) it would violate Argentine chivalry to act "when defeat is inexorably drawing closer to the countries of the Axis," and (3) to act "without a cause to justify it . . . would afford grounds to believe action is being taken under the pressure or threat of forbeing taken under the pressure or threat of foreign agents, and this would not be tolerated by either the people or the armed forces of the country." The letter suggested that to pave the way for a possible future departure from neutrality President Roosevelt "should make a gesture of genuine friendship toward our people" through "the urgent provision of airplanes, spare parts, armaments, and machinery to restore Argentina to the position of equilibrium to which it is entitled with respect to other South American countries." Secretary Hull replied that "the undoubted sen-

timents of the Argentine people have not been implemented by action called for by the commitments freely entered into by their Government in common with the Governments of the other twenty American republics." Argentina, he pointed out, had failed to sever diplomatic, financial, and com-mercial relations with the Axis powers. It had "authorized financial transactions of direct bene-fit to the enemies of the United Nations." It was permitted Axis agents to engage in "systematic espionage which has cost the United Nations ships and lives." It had intervened to assist Axis-subsidized publications in obtaining supplies of news-

print at favorable prices.

Finally, Hull charged, Argentina was the only American republic permitting radiotelephone and radiotelegraph communications with Japan, Germany, and Italy. Since United States policy was guided exclusively by considerations of hemisphere security and the Argentine Government had shown no disposition to join in hemisphere defense measures, Hull's letter said it would be impossible for President Roosevelt to furnish Argentina with arms and munitions under the Lend-Lease Act. The letter added that by failing to comply with its inter-American commitments, the Argentine Government was depriving that country of participation in the solution of postwar problems.

The Cabinet Crisis. Publication of the Storni-Hull letters in Argentina shook the Ramírez Government to its foundations. It inaugurated a bitter struggle between the moderate and extremist nationalist elements within the Cabinet. Admiral Storni resigned September 9 and his two chief aides in the Foreign Office were ousted the next day. Gen. Alberto Gilbert, the anti-United States Interior Minister, assumed the Foreign portfolio

temporarily.

The position of President Ramírez, whom Storni had quoted as approving his letter, was likewise threatened. On September 11 several hundred army and navy officers, affiliated with a pro-Axis military organization headed by Col. Juan Domingo Perón, interrupted a Cabinet meeting to demand an explanation. Ramírez assured them that his good faith had been taken advantage of. The same

day a proclamation attributed to anti-democratic army officers was circulated. It repudiated the Storni letter as "full of falsehoods" and "an af-It threatened "Argentines and comrades in arms." It threatened "Argentines who think and act on behalf of foreign interests" with "violent ejection from the revolutionary crusade."

Pressure from the Perón group of officers was generally considered a major factor in the triumph of extremist elements within the Government when the Cabinet crisis came to a head in October. On October 7 Dr. Felipe A. Espil, pro-democratic Argentine Ambassador to Washington since 1931, was replaced by Dr. Adrian C. Escobar, ardent Falangist and close friend of the Spanish Nationalist dictator, Gen. Francisco Franco. War Minister Gen. Edelmiro Farrell, a member of the Perón or-ganization, was appointed Vice President by Ramírez on October 11. (Vice President Sueyro had

died in mid-July.)

Two days later the three Cabinet members favoring an immediate break with the Axis resigned. Finance Minister Jorge Santamarina was replaced by Cesare Ameghino, reputed pro-Nazi; Public Works Minister Adm. Ismael Galíndez by Naval Capt. Ricardo Vago, a pro-Allied officer; and Justice and Education Minister Gen. Elvio Anaya by Gustavo Martínez Zuviría, a strongly pro-Nazi enemy of the United States who had written violently, anti-Semilio hoole who had written violently. lently anti-Semitic books under the pen name Hugo Wast. The Cabinet changes were accompanied by heavy troop movements in Buenos Aires and the reshuffling of army commanders to eliminate those having political views at variance with the Government. On October 21 General Gilbert was named permanent Foreign Minister and another strongly anti-democratic military man, Gen. Luis C. Perlinger, succeeded him as Minister of Interior.

Trend Toward Absolutism. From this time on the Government displayed an increasingly reactionary and repressive attitude. The suspension of several Jewish newspapers brought an emphatic protest from President Roosevelt on October 15. The ban

was immediately rescinded.

Four leading Argentine newspapers on October 15 published a strongly worded declaration, signed by 150 leading Argentines from all parties except the Nationalists, demanding "effective democracy" and "loyal fulfillment of international obligations." The next day President Ramírez decreed the dismissal of all public officials who had signed the manifesto. This action had wide repercussions. The ousting of many distinguished university pro-fessors set off violent student strikes and riots. More than 40,000 students were reported to have boycotted their institutions, which had been placed under Government interventors. Numerous other government officials resigned.

The Government repressed all opposition with an iron hand. The inter-university student federation was outlawed along with an increasing number of other pro-democratic organizations. Charters of Jewish and Masonic welfare and mutual aid associations were withdrawn in some provinces. All criticism of Government policies was declared illegal and punished by imprisonment in desolate Patagonian concentration camps. The pro-democratic press, which had seized every occasion to urge fulfillment of the Government's initial pledges, was placed under increasingly stringent censorship. All wire and radio communications facilities were put under the War Ministry's control on November 6. On November 9 a Ministry of Press and Information, headed by

Col. Enrique Gonzales, was established to control

all sources of public information.

Perón Bosses Labor. The Government encountered its chief difficulty in attempting to control labor. A ban on strikes issued soon after the coup d'état of June 4 proved ineffective. Late in October Colonel Perón was appointed chief of the National Labor Department to curb rising labor unrest. When he sought to forestall further walkouts by sending numerous labor leaders to the Neuquen concentration camp, the workers in two La Plata packing plants struck and forced a suspension of operations. However the suppression of all news of these events prevented the spread of the labor dis-turbances. On November 30 Perón was appointed head of a new Secretariat of Labor and Social Security, charged with controlling labor-capital re-lations. He retained his post as Secretary General of the War Ministry and also as secretary general of the anti-democratic Army-Navy officers organization, known as the GOU.

Anti-Communist Drive. In suppressing all opposi-tion elements, the Ramírez Government placed particular emphasis upon rooting out communism, both real and imagined. Communist organizations were raided and suppressed. All books and periodicals with anything resembling Communist propaganda were "purged" from schools, libraries, and publishing houses. The campaign against communism was employed to suppress many non-Communist organizations and publications disapproved by the Government. On December 2 Minister of Education Martínez Zuviría ordered the dismissal of professors and teachers "appearing to hold ideas contrary to public order. student taking part in "subversive propaganda or actions" was to be barred from all universities and schools and made liable to "sanctions of another nature."

Political Parties Banned. The culmination of this reactionary trend was reached on December 31 when decrees dissolved all political parties, banned all political activities, and made the teaching of the Roman Catholic religion compulsory in all primary and secondary schools. Meanwhile some hundreds of political refugees had fled Argentina to Uruguay, Brazil, and Chile to escape arrest. Numerous illegal anti-Government publications made their appearance; some were printed in neighboring countries and smuggled across the Argentine border.

Late in December a new Federal police force was created to assist the dictatorship in crushing the opposition. Minister of Public Works Vago, said to be the only pro-democratic figure in the Government, resigned December 23. By the year's end the military dictatorship appeared well on the way toward the establishment of a Fascist regime

modeled on that of Franco Spain.

Other Foreign Relations. On Jan. 1, 1943, the Argentine Foreign Office angrily criticized a statement issued by the British Foreign Ministry the previous day deploring Argentina's continuance of diplomatic relations with the Axis Powers. Nevertheless Britain early in April renewed its annual contract to buy Argentine meat surpluses at slightly higher prices. The contract called for the delivery of 720,000 tons of beef, mutton, and pork at the rate of 50,000 tons monthly. Even more important contracts for Argentine meat and eggs were signed by Great Britain in September. Denying that this action had political significance, the British Foreign Office on September 27 again criticized Argentina's failure to line up with the other American republics.

Price gouging by Argentine exporters led the Union of South Africa in August to impose an embargo on all Argentine goods. On July 28 the Argentine Government took over three French merchant ships that had been lying in port at Buenos Aires since the fall of France; this in-creased the Argentine state mercantile marine to 31 ships of 219,000 tons.

On January 11 the Foreign Office demanded that Germany recall its naval and air attaché in Buenos Aires, Capt. Dietrich Niebuhr, after the latter refused to waive his diplomatic immunity and appear before the Supreme Court to answer charges of espionage made by the Chamber of Deputy's special committee investigating anti-Argentine activities. Niebuhr sailed on a Spanish

ship January 30.

Argentine-Chilean relations remained cordial despite Chile's decision to break with the Axis. In mid-April Argentina signed a 10-year contract to purchase large quantities of natural nitrates and iodine from Chile. Late in August the two countries signed agreements for the exchange of noncompeting goods without customs duties and for the early completion of the Antofagasta-Salta railway and other projected Argentine-Chilean highway routes.

The Argentine Government continued its efforts to develop closer political and economic relations with Bolivia and Paraguay in answer to Brazil's growing contacts with those republics. Without waiting for the other American republics to act, the Ramírez Government on December 30 decided to recognize the newly established revolutionary government of Bolivia, with which it was believed to have close ideological ties. In November Argentina signed a commercial treaty giving important concessions to Paraguay. During a state visit made to Buenos Aires by the Paraguayan President December 11-16 Paraguay obtained a free port in the Argentine capital and other substantial eco-nomic favors, described in the article on PARAGUAY under History.

ART. Despite the war, heavy taxation, and greatly increased cost of living, the year 1943 in art was far from dull. Perhaps as never before in this country, art has been recognized as an important factor in the better living for which democracy aims, and effort has been made on many sides to correlate it with life and so avoid the threatened blackout of

culture. Also, artists have been called upon for definite services which heightened self respect and gave assurance of confidence—in other words of being needed. The experimental type of art, for the time being, gave place to the traditional—there was something to be said which must be said clearly. The art museums redoubled their effort to take art to the people and especially to reach men in the armed service, as well as workers in essential industries. The market for works of art by the great masters was exceptionally good, although that for the works of contemporary paintings and prints dropped sharply. The sculptors especially suffered, as their chief medium, bronze, became unobtainable. There were fewer large benefactions in the field of art than usual and almost no building was done, but the art museums continued to make notable acquisitions through income on endowments for such purpose. From a broad view the prospect

was found to be far from discouraging.

Art Museums. One of the outstanding events of the year was the merger of the Whitney Museum of American Art, of New York, with the Metropolitan Museum of the same city. This took place in March. The last exhibition held in the Eighth Street building by the Whitney Museum before the merger was of sculpture by Gertrude Vanderbilt Whitney, founder and patron, which took the form of a memorial. For twelve years, under Mrs. Whitney's guidance and patronage, the museum had functioned in many ways to advance interest in the work of young American artists. Encouragement was given through prizes and purchases and by facilities for exhibition and sale. A large and representative collection was at the same time built up for the Museum. According to the terms of the merger, a "Whitney Wing" is to be added to the Metropolitan Museum of Art after the war, in which works from the Whitney Museum collection and others belonging to the Metropolitan Museum will be shown. The educational program instituted by the Whitney Museum will be carried on as heretofore and extended. Mrs. Juliana Force, formerly Director of the Whitney Museum, was, when the merger became effective, made Advisory Director. Owing to lack of space in the Metropolitan Museum prior to the building of the new wing, the Whitney Museum's annual exhibition which opened in November, was held in the old building at 10 West 8th Street. No prizes were given but \$20,000 was spent for purchases, each Museum contributing one half.

In February, announcement was made of the transfer of the Albert E. Gallatin Collection of Modern Art from New York University to the Philadelphia Museum, where it will be displayed as a unit and remain on loan during Mr. Gallatin's life, after which it is to become the property of the Museum. This collection had for fifteen or sixteen years occupied alcoves in a study hall in the University's Washington Square building and been known as the "Museum of Living Art." The reason for the transfer was the University's need of the

space occupied.

In April the Chester Dale collection of Twentieth Century French Paintings was put on exhibition in the Chicago Art Institute, as an indefinite loan. This collection, which is world famous, comprises about fifty examples of the work of French modernists-Picasso, Braque, Matisse, Utrillo, and others -which were for the most part acquired by Mr. and Mrs. Dale from the artists. Later in the year Mr. and Mrs. Dale lent a fine group of paintings of the same school to the Philadelphia Museum.

The Jules S. Bache Collection of old master

paintings and objets d'art was removed from the Bache residence on Fifth Avenue and lent, for the summer, to the Metropolitan Museum of Art. One of the galleries in which it was shown was remodeled by Mr. Bache, with the cooperation of the Museum, as an 18th Century dining room in the style of Louis XVI, similar to such a room in his house. The Bache Collection covers the art of four centuries and is of superlative quality. The loan to the Metropolitan Museum was made in order that a larger public might profit by it than the Bache residence could accommodate.

In March announcement was made of the gift to the National Gallery of Art of the Lessing J. Rosenwald collection of prints, drawings, manuscripts and rare books—the prints and drawings designated to the Gallery, the manuscripts and books to the Library of Congress for its Rare Book room. Some idea can be had of the importance and munificence of this gift because among its 8,500 items are unique woodcuts and rare engravings of the 15th Century including 67 of the former and 91 of the latter by Albrecht Dürer; all of Van Dyck's portrait etchings, many in rare states; 230 etchings by Rembrandt, and 367 by Whistler, who is also represented by many drawings. Just before Christmas eighty prints and drawings selected as indicative of the character and scope of this great collection were exhibited in the National Gallery of Art and handsome illustrated and annotated catalogue

In August the National Gallery of Art announced the gift of the Richter "Archive of Illustrations on consisting of over 64,000 photographs and illustrative cuttings, assembled over a long period of years by Dr. George Martin Richter, eminent authority on Italian art. The donor was Solomon R. Guggenheim, founder of the Museum of Non-Objective Art, New York. This Archive, which is expertly connotated, greatly increases the facilities

for study of Italian art in this country.

published.

In this connection mention should be made of the establishment by the Philadelphia Museum of "Archives of American Art," to consist of illustra-tions, reproductions, letters, and other documents having to do with the lives and works of American artists. These are to be preserved in the vault of the Museum's Print Department, available to students and writers at all times and made known to the public through recurring exhibitions. They will be developed under the supervision of a Council of experts headed by Carl Zigrosser, Curator of Prints of the Philadelphia Museum.

One of the outstanding events of the year, was the gift of the Grenville L. Winthrop collection to the Fogg Museum of Harvard University. This collection comprises over 4,000 items of diverse character, paintings, sculpture, water colors, drawings, porcelains, and furniture. It is especially rich in water colors and drawings of the 19th Century of which there are more than 400; among them are 52 by Blake and 42 by Ingres. Also included among the oil paintings are Peale's portrait of Washington, Duplessis' of Benjamin Franklin and David's of Napoleon. The collection was transferred to the Fogg Museum shortly after Mr. Winthrop's death (see Necrology) but not exhibited until October,

and then only in part.

The Cranbrook Academy of Arts, at Bloomfield Hills, Mich., founded and endowed by George G. Booth of Detroit, early in 1943 took possession of its new art building. Essentially modern in design, but simple and sincere, with beautiful setting, this building of functional brick and stone, 400 feet in length, two stories in height, provides exhibition galleries, study halls, work rooms, and library. The architect was Eliel Saarinen, one of the leading exponents of modernism, and head of the Academy. Factors in the setting are works in sculpture by Carl Milles, renowned Swedish sculptor, now a citizen of the United States and head of the Cranbrook Academy's Department of Sculpture.

Gifts and Loans. Numerous gifts and loans were made to the National Gallery of Art during 1943; most notable among them was that of \$5,000,000 given by the Mellon Educational and Charitable Trust, formally accepted by Congress on April 3. The Trust also gave to the National Gallery of Art 63 portraits by early American painters, chiefly derived from the Thomas B. Clarke Collection, acquired en bloc by Mr. Mellon shortly before his death. Included in this gift were 19 paintings by Gilbert Stuart, which, added to the five previously presented by the Trust, collectively afford a survey of Stuart's manner and style not to be found in any other institution. Twenty-two of the portraits given were accepted under the condition that should a National Portrait Gallery be established by the Government within twenty years they would be turned over to it.

Other portraits by early American artists were given the National Gallery by private collectors: five by Mr. and Mrs. Chester Dale, one by Clarence Van Dyke Thiers. From Mr. and Mrs. Dale the Gallery received, later in the year, eleven important canvases by master painters previously loaned. These included works by masters not already

represented in the National Collection.

From the J. H. Whitmore Company of Connecticut, the National Gallery of Art received two very important full-length figure paintings by Whistler, "The White Girl" and "L'Andalouse"—the one of his favorite model "Jo," the other of his sister-in-law, Ethel Birnie Phillips.

The City of New York in January, 1943, appropriated \$40,000 to cover the cost of preparing plans for alterations and improvements to the Metropolitan Museum of Art, included on the Mayor's program for Post-War Public Works. The Museum appropriated from its own funds a like sum and Robert B. O'Connor and Aymar Embury II, architects, were appointed to draw plans. The total cost of construction envisioned is given as \$4,000,000.

The Rhode Island School of Design received from ex-Senator Jesse H. Metcalf \$500,000 for further endowment, he having been a founder and valued Patron of the institution for years.

Building and Development. The Walker Art Center, Minneapolis, established in June an American art section through the purchase of fifteen paintings by contemporary artists, with funds derived from the T. B. Walker Foundation.

The Pasadena Art Institute, through the generosity of Grace Nicholson, acquired the building in the center of the city previously used by her as an art gallery and home. It provides headquarters for the Institute, five large and seven small galleries for exhibition purposes, as well as studios, class rooms, and assembly hall.

The Addison Gallery, Phillips Academy, Andover, Mass., put into effect in September a unique plan for the upbuilding of its permanent collection. An exhibition (to be thereafter an annual event) consisting of paintings, drawings, and sculpture desired for acquisition, was held, and members of the Gallery Association were invited to buy-but with the understanding that works so acquired, after loan to the purchaser for a fixed number of years, would become the property of the Gallery,

A work priced at \$100 or less could be kept for two years, those priced from \$200 to \$500 for three.

A somewhat different, but also novel, plan with similar object was inaugurated in Tucson, Ariz., under the auspices of the University of Arizona, and the generous enterprise of a private collector who gave up collecting postage stamps to collect paintings by contemporary American painters to be placed in public institutions. The goal was 100 paintings in five years, and cooperation on the part of the public was invited. All purchases are to be made under advise, and the cost will not be excessive—about \$250 for oils and \$50 for water colors. The first year's purchases were exhibited in the Whitney Division of the Metropolitan Museum of Art in April.

The Iranian Institute, New York, acquired as a permanent home property at 9 East 89 Street, formerly a private residence. This will house its School of Asiatic Studies and provide space for library, offices, study rooms, and five galleries, the largest of which will be devoted to Chinese and Indian Art, one to the art of Turkey and the Near East, and others to that of Irania.

The Brooklyn Museum opened in February a series of new galleries devoted to the display of the Colonial and Folk Art of South America. Two important period rooms were installed late in 1943one, a stately English drawing room supposed to have been designed by William Kent, is in the Huntington Museum, San Marino, Calif., the other, a drawing room designed by Robert Adam, from Lansdowne House, London, was acquired in 1934 by the late George H. Lorimer and given in his memory to the Philadelphia Museum of Art by Graeme and Sarah Lorimer.

Discontinuance of Federal Activities. By order of President Roosevelt the Work Projects Administration and the Section of Fine Arts, Public Buildings Administration, were terminated on July 1 as no longer essential. In both instances skeleton organizations were retained to wind up outstanding af-

fairs.

The art program of the WPA, directed by Holger Cahill, employed artists all over the country at a minimum wage, to paint and to draw, make prints, and produce sculpture, their works becoming the property of the Government and allocated to various public and semi-public institutions. To cultivate a knowledge and appreciation of art, 90 art centers were established where no art galleries were previously to be found; exhibitions were held and various allied projects sponsored. The "Index of American Design" came into being through these channels. Over ten million dollars were spent on this work between 1935 and the time of its discon-

The Section of Fine Arts, PBA, which was created in October, 1934, was of a different nature. Its function was to secure from artists of ability decorations, chiefly mural paintings and sculpture, for Federal buildings—post offices, court houses, and the like. Anonymous competitions were set up and awards made by juries of outstanding pro-fessionals in the several fields. The cost was met from a one-per cent allocation from the amount appropriated for building. From October 16, 1934 to July 30, 1943, these expenditures reached \$1,870,988. This covered the cost of 1,092 mural paintings and 287 works in sculpture, placed in 1,208 Federal buildings—in almost as many cities throughout the United States. These were obtained through the channel of 191 competitions, in which 40,989 artists were competitors and 40,988 works entered.

No other country in the world has ever put into effect so gigantic a program as this of the WPA and the Section of Fine Arts, jointly, for the advancement of art. It is too early to correctly evaluate results; while no outstanding genius has as yet emerged there is no doubt that horizons have been greatly widened and new estimates of art set up.

Edward Bruce, who instigated this gigantic work and directed its development as Chief of the Public Works of Art Project, the Section of Painting and Sculpture, and the Section of Fine Arts, successively, died on January 27, 1943, in the Hollywood Hospital, Hollywood, Fla. A group of over one hundred artist friends contributed a painting each to be given to the hospital in which his life ended.

Art Education. Two epoch-marking reports on art education were published and given wide circulation here and abroad during 1943. The one issued in this country had chiefly to do with the adjust-ment of the college curriculum to wartime conditions and needs, obviously, however, looking to the future. It came from the United States Office of Education (q.v.) and was drawn up by a group of professors of art in American colleges and instructors in Art Museums, eleven in number, headed by Sumner McK. Crosby, president of the College Art Association and assistant professor of Art at Yale. The British report came from a special committee appointed by the Royal Society of Arts and was published in the Society's Journal. This gave first consideration to the service to be rendered by art in postwar days in the industrial field.

In Britain during 1943 a great educational program in the arts was conducted with outstanding success by a Council for the Encouragement of Music and the Arts, working in cooperation with the National Board of Education. Under this program the best music, drama, and exhibitions of fine arts were taken to the people not alone in the cities but in the rural districts throughout the land. Half of the cost of this program was donated by the Pilgrim Trust, founded and endowed by the late Edward Harkness of New York to promote closer friendship and better understanding between the British and American people. The other half was appropriated by the British Covernment, which never before had been willing to "interfere in the Fine Arts." It was the Pilgrim Trust that took the initiative and thus overcame objection. This "adventurous policy" will, it is thought, have a lasting effect on British life.

A somewhat similar effort has been made in this country but through separate agencies rather than coordination. An outstanding instance is that of the Sunday evening concerts, exhibitions, etc., arranged especially for service men and their guests by the National Gallery of Art. The Metropolitan Museum of Art has likewise given free concerts of the best orchestral music; and has lent paintings, sculpture, and art objects from its permanent collection to a large General Hospital for war wounded, situated on Staten Island. Similar instances might be noted throughout the country under like patron-

Salvage and Restoration of Art in Europe. To protect and salvage works of art in the war zones definite steps were taken early in 1943. The American Council of Learned Societies, of which Waldo G. Leland is director, took the initiative by appointing in January a committee of leading authorities in the field of art, not only to call the attention of the Government to immediate need, but also to place at its disposal the services of those best qualified to serve as advisors. Headquarters were established in

the Metropolitan Museum, New York, and research work was promptly organized in the Frick Library, which generously offered cooperation. This committee was headed by William B. Dinsmoor, president of the Archeological Institute of America, and had as members Francis H. Taylor, director of the Metropolitan Museum of Art, David E. Finley, director of the National Gallery of Art, Charles R. Morey of the Art Department of Princeton University, Paul J. Sachs, Professor of Art at Harvard, Henry M. Lindenberg, historian, Charles Henry Chase of Harvard, author, and Archibald Mac-Leish, Librarian of Congress. To cover actual costs a grant was made by the Rockefeller Foundation, but much service was volunteered. In fact over a thousand experts within the year freely offered assistance. Of these, quite a number were refugees. The information sought concerned the location of works of art and historical monuments which should be protected and restored as far as humanly possible.

In August a second committee was appointed by the President through the Department of State, not to supersede the earlier one but to give governmental sanction and authority. Organization of this official committee (first suggested by Chief Justice Stone) was effected at a meeting held in the National Gallery of Art at Washington, D.C., on August 25. The chairman is Associate Justice Owen D. Roberts. David E. Finley is vice chairman, Huntington-Cairns, also of the National Gallery, secretary; while serving as members are William B. Dinsmoor, Francis H. Taylor, Paul J. Sachs, Archi-

bald MacLeish, and Herbert H. Lehman.

Through these coordinating committees considerable work was done with exceeding promptness. Maps were drawn on which monuments to be spared in bombing raids, if possible without interference with military requirements, were indicated. These, placed in the hands of the government, were transmitted to those in command in the field, duplicated, and placed in the hands of bombers, with suitable instructions. Also instruction was given along these lines, and in the history of art in the schools for officers training with a view to post-war service. Young men called from Art Museum positions to the armed service were selected to receive this instruction and qualify for such duty. One of the most important of such teaching centers was at the University of Virginia, Charlottesville, during the summer of 1943.

The United States is to cooperate in this work with similar committees appointed by our Allies and those of the subject countries. Great Britain has already taken steps in this direction. Men from the British Museum, Ministry of Works, National Gallery, and Royal Institute of British Architects have been assigned and in some instances already

sent to occupied territory.

Artists in the War. In March, 1943, the War Department selected forty-two American artists to paint, under the supervision of the Army, war as witnessed on the several fronts. By the end of April eight of these had gone to the Southwest Pacific theater of combat and one to Alaska, while fourteen in uniform awaited assignment and twenty were working as civilian employees. In July, however, Congress declined to appropriate the \$125,000 estimated cost of salaries and travel of these men, and there was nothing to do but cancel the appointments and order the artists home on a month's notice. On the publication of these facts, the magazine Life, which had already sent artists to the front, took over several of these men, and thus enabled them to continue the work for which they had volunteered. Others stayed on voluntarily. Colliers

signed up for several.

In this connection mention should be made of the series of oil paintings made by Lt. Com. Anton Otto Fischer, U.S. Coast Guard, of the cruise of the Coast Guard cutter Campbell, on convoy duty and sunk by enemy action. These are not only il-lustrative but vividly impressive as works of art. They were made under commission of *Life* and given by its publishers to the U.S. Coast Guard, by whom they were exhibited in Washington and else-

Two very notable series of water colors, one of "American Industries Geared for War" and the other of "Traffic and Transportation" were made by Thornton Oakley, illustrator and mural painter, for the National Geographic Magazine in which they were reproduced in full color, later to be sent

on a nationwide exhibition circuit

At the National Gallery toward the last of the year were shown 101 drawings and paintings by seven American artists picturing Naval Aviation from preflight to combat—and admirably. About the same time a collection of paintings and drawings by Merchant Seamen of the United Nations was put on view in the Corcoran Gallery of Art. Both of these exhibitions were sponsored by the Government and Government owned. They, also, were to be sent out on circuits.

Exhibitions. Professional organizations held their annual exhibitions as usual but under severe restrictions. Prizes were awarded in accordance with custom, but there were fewer sales and less enthusiasm, as well as obvious gaps among contributors. In the large cities several engaging exhibitions were held to raise funds for war relief; others for the benefit of home charities. Among the most notable of these were exhibitions of paintings by Forain in New York and of paintings by Renoir in

Los Angeles.

During the early part of the year the Cleveland Art Museum exhibited as a unit in its galleries the important collection of paintings and other works of art bequeathed to it some years ago by John L. Severance. This collection in many respects paral-lels that given by Mr. Widener to the National Gallery of Art. Later in the year the 250 units of which it is composed were distributed among the galleries according to era and school

In December the Metropolitan Museum placed on exhibition the collection of Medieval and Renaissance Art—200 items—assembled and bequeathed to it by its late president, George Blumenthal.

A delightful collection of French 18th and 19th Century drawings and water colors from the Louvre, other French museums, and private collections was shown in the National Gallery of Art in March and again, by urgent request, in August. These are part of a larger collection of French paintings, derived from the same source, held for the duration and continuously on view.

Two very noteworthy exhibitions were held in the Worcester Art Museum: one of "New England Ancestral Portraits," in cooperation with the Amer-ican Antiquarian Society, consisting of 55 works all of the 18th Century and painted in New England; the other of "Contemporary New England Crafts," likewise calculated to engender local pride. The Metropolitan Museum of Art, New York,

lent to the Milwaukee Art Institute in 1943, 150 of its permanent exhibits—paintings, tapestries, and ceramics for display for from three to five years.

Astounding reports of exhibitions in England and France reached this country in early autumn. From England the news was that 405 works shown

during the summer in the Royal Academy's annual exhibition, Burlington House, London, were sold, for the equivalent of \$56,105. The report from Paris was to the effect that all the art organizations had, during 1943, held their annual exhibitions as usual, and that in the "Salon des Independantes" 3,300 works were shown, while the "Salon d'Hiver" catalogued no less than 2,000. Among other exhibiting bodies chronicled as carrying on were the "Artistes Français" and the "Nationale des Beaux Arts."

In an exhibition, held in the fall in the National Archives, Washington, of materials from the Franklin Delano Roosevelt Library, was shown a painting of Marrakech, Morroco, by Prime Minister, Winston Churchill, done in 1929 and given by him to President Roosevelt in January, 1943, at the time of the Casablanca Conference in North Africa; an excellent and charming work in oils, well up to the

best professional standard.

Painting. Painting in the United States in 1943 was at a low ebb—quantitative rather than qualitative. This may have come from a lowering of standard or from excessive exhilaration under government patronage. Also it may have been affected by the unrest of war time. There were many pictures painted both in oils and in water color but very few that were outstanding. Those organizing the big exhibitions found it difficult to obtain outstanding examples; the dealers complained that there were not enough of fine quality to supply the demand of private buyers. Of course there were exceptions. Some of the best paintings shown were of the war or in the interest of victory. To a large extent, in the rendition of other subjects, the "Main Street" element and the influence of the French modernists were dominant. In this field art seemed to have lost its traditional elegance and beauty.

Especially indicative of current trends in painting were the exhibitions held in the late autumn by the Carnegie Institute, Pittsburgh, the Chicago Art Institute, and the Philadelphia Water Color Club, all of which were made up of works invited. The Carnegie Institute's exhibition was entitled "Painting in the United States" and included 304 oil paintings chosen by John O'Connor, acting director. Of the \$3,200 distributed in prizes, the first and largest (\$1,000) went to Wayman Adams for a portrait of the well-known cellist, Gregor Piatigorsky, playing. The jury of award consisted of three museum men: the directors of the Metro-politan Museum, Francis H. Taylor, and of the Toledo Museum, Blake-More Godwin, and the secretary of the Detroit Museum, Clyde H. Burroughs.

There were only 198 paintings and 29 pieces of sculpture in the Chicago Art Institute's 54th Annual; \$2,700 were distributed in prizes by a jury composed of the director of the Addison Gallery,

Bartlett H. Hayes, Jr., a painter, Charles Sheeler, and a sculptor, Henry Kreis.

In the Philadelphia Water Color Club's 41st Annual Exhibition in the Pennsylvania Academy, there were 340 water colors and prints. Awards were made by a mixed jury of professionals and lay members. To Phil Paradise went the Philadelphia Water Color Club prize, to Millard Sheets the Dana Water Color medal, to Clare Leighton the Eyre medal, and to Stow Wengenroth the Pennell Memorial medal, the last two for prints. All three of these exhibitions were widely representative.

On January 5 a series of four mural paintings by Barry Faulkner was dedicated in the Senate chamber of the New Hampshire State House at Concord. The subjects were all related to the history of the State. One in particular pictured the late Abbott H. Thayer, artist, of Dublin, N.H. pursuing his study of protective coloration which laid the foundation of camouflage.

Three pictorial panels representing the "Reconstruction and Well-being of the Family" by Philip Guston were completed early in the year and placed in the Social Security Building at Washington. On January 6 a mural of Marian Anderson singing to a vast audience from the steps of the Lincoln Memorial in Washington, was ceremoniously unveiled in the Department of the Interior. The artist was Mitchell Jamieson, of Washington. The cost of the mural was met through private subscription.

A large mural entitled "The Four Freedoms" was painted by Hugo Ballin for the new Burbank City Hall, California, primarily, he said, to bring the Atlantic Charter and its meaning home to the people. The composition is very elaborate and in very different vein from the illustrations of the "Four Freedoms" executed by Norman Rockwell and, after publication in the Saturday Evening

*Post*, widely circulated.

A sharp controversy arose over the whitewashing of a large mural painting, seventy feet long, placed in a public high school in Columbus, Ohio, in 1938, by the PWA, which had not, it seems, been approved by the principal or members of his board. The artist offered to remove the whitewash and make necessary restorations free of charge, but his offer was declined. Similar incidents were reported from other locations.

Commissions for seven mural paintings depicting the Negroes' contribution to life in America were commissioned in April for the lobby and li-brary of the Recorder of Deeds' new building in Washington, by the Section of Fine Arts of the Treasury Department. These commissions went to seven different artists. The position of Recorder of Deeds in Washington has customarily been held by a Negro. A mural based on the Negroes' contribution to "Democracy for America," the work of Charles W. White, was dedicated at Hampton Institute during 1943. The work was done under a Rosenwald grant. The painter is a 25-year-old Negro born in Chicago.

A second annual exhibition of the works of Negro artists, at which \$500 were distributed in prizes, was held in Atlanta, Ga. "Young Negro Art," an exhibition of the work of students at Hampton Institute, was held in the Young People's Gallery of the Museum of Modern Art, N.Y., in October. In Washington, the same month, there was established a dealer's gallery for the display and sale of works by Negro artists and others, under the charge of the former curator of the Howard University Art

Gallery.

Latin American Art. To meet the demand of teachers and students for information concerning the art of South and Central American countries the Pan American Union in 1943 prepared an envelope containing thirty-eight photographs, 6 × 9 inches in dimensions, of the works of outstanding Latin American artists. Accompanied by an essay on Latin American painting by Dr. Robert C. Smith of the Library of Congress, it could be circulated at small cost and proved popular. It is Dr. Smith's opinion that the Latin American countries, more than our own, have evolved a distinctive national art.

Exhibitions of paintings by Latin American artists have continued, but on a less extensive basis than during 1942, the war making travel and transportation most difficult. As an international courtesy a number of these have been shown in the U.S. National Museum at Washington and the Pan American Union.

The first of the year the Secretary of State notified those concerned that the increasing exigent demands of the war upon the manpower supply in the United States made it necessary for our government to suspend for the duration the award of official scholarships, fellowships, and travel or maintenance grants to students from the United States. The Secretary also declared the intention of resumption thereafter when conditions would permit. No grants previously made were withdrawn, and visiting students have been made welcome.

Prints. Mention has already been made of the magnificent gift of the Rosenwald collection to the National Gallery of Art, which institution likewise had the good fortune to receive complete sets of Whistler's Venice etchings, the first comprising 12 done in 1880 and the second 26 done five years later, both very rare. These were the gift of Mrs. J. Watson Webb, in memory of her mother, Mrs. H. O. Havemeyer. The Library of Congress, Division of Fine Arts, acquired through gift and purchase, and the generous cooperation of the artist's family, an almost complete collection of the etchings of the late J. Alden Weir, comprising 80 to 90 prints. Through the gift of Albert W. Wiggins the Public Library, Boston, acquired in 1943 a complete set of etchings by Frank W. Benson,

many in rare states.

Financed by income from the Pennell Fund for the advancement of the graphic arts, a national competition was set up, and an exhibition held, under the auspices of the Division of Fine Arts of the Library of Congress, in the late spring and early summer of 1943. Both competition and exhibition were limited to prints made within 12 months of the date of submission. Over one thousand prints were submitted from printmakers in all parts of the country, of which 467 by 386 artists were selected for display. Thirty-five received awards, which took the form of purchases for the national collection at prices a little higher than the market called for. The jury consisted of John Taylor Arms, etcher, Stow Wengenroth, lithographer, and Dr. Holland. From the prints shown, 85 were selected by the American Federa-

tion of Arts for showing throughout the country.

Leicester B. Holland, for nearly fifteen years
Chief of the Division of Fine Arts of the Library of Congress, resigned October 1, nominally to resume teaching. During his term of office the Library's print collection was almost doubled and its uses greatly increased. Also through his in-itiative the "Cabinet of American Illustration" was established and the "Pictorial Archives of Early American Architecture" set up.

The Metropolitan Museum of Art received from the PWA in the autumn a collection of 1,700 prints made by American printmakers under government patronage. These, selected from many more offered, greatly augment the Museum's col-

Sculpture. Sculptors have been much handicapped during the war by restrictions in the use of metals. For this reason many have taken to cutting their works in marble or stone, or casting them in cement and other compositions. Many have sought and, because of technical proficiency, found occupation in war industries. Contracts given by the Government for sculpture are to hold good after the war, but with the conclusion of the Section of Fine Arts the prospect of new contracts through this source came to an end. The war has put a stop to private orders for monumental works.

On April 13, the two hundredth anniversary of the birth of Thomas Jefferson, the Jefferson Memorial in Washington was ceremoniously cated, and a 16-foot standing statute of Jefferson by Rudolph Evans of New York unveiled. Eventually this is to be cast in bronze but temporarily it was set up under the dome of the rotunda in plaster, painted. It is a composite portrait, made after much study of source material, and is thought to well represent the great statesman. On the pediment above the front portico of the Memorial is a bas relief by Adolph A. Weinman, also of New York, depicting Jefferson reading a draft of the Declaration of Independence to a Committee of the Continental Congress including, among others, Franklin, Adams, and Livingston. The veracity of these sculptured portraits was to a measure confirmed by a collection of portraits of Jefferson and his contemporaries, painted by the artists of their day, assembled and set forth in celebration of the occasion by the National Gallery of Art.

Two very acceptable gifts of sculpture were received by the National Gallery in 1943. These were "La Surprise" by Clodion, given by Mrs. Jesse Isidor Straus of New York in memory of her husband, formerly Ambassador to France; and "The Age of Bronze" by Rodin, given by Mrs. J. W. Simpson. Sculpture from the Widener Collection belond to fill the good according to the collection belong to fill the good according to the collection belong to fill the good according to the collection to helped to fill the gap occasioned by the removal, for the duration, of notable works comprised in

the Mellon and Kress gifts.

A bronze statue of Sir William Blackstone by Paul Bartlett was given to the United States for placement in Washington by the sculptor's widow. This was originally produced under commission from the American Bar Association to stand outside of The Temple in London. On being placed within the famous Law Courts the sculptor found it too large and therefore remodeled the subject on a slightly smaller scale and had it cut in stone. The original in bronze, thus released, is to stand on the plaza in front of the District of Columbia Court House in Washington.

The National Sculpture Society limited its annual exhibition in 1943 to ecclesiastical subjects shown for the most part through the medium of

photographs.

Acquisitions. The Art Museums purchases during 1943 strengthened their permanent collections, funds from endowments being available for this and no other purpose. Among the most notable of the works thus acquired were the following:

"Virgin and Child" by Murillo from the Santiago Collection, Madrid, by the Metropolitan Museum of Art; "Virgin and Child in Glory with Saints" by Veronese and "Gentleman with a Book" by Titian, by the Museum of Fine Arts, Boston; "Don Juan Antonio Cuerva" by Goya and "Mille. Romaine Lacoux" by Renoir, by Cleveland Museum of Art; "Marquese de Fortana" by Goya, portraits by Van Cleve and Mary Cassatt, and landscape by Monet, by Joslyn Memorial, Omaha; "Wroth of Neptune" by Rubens, by the Fogg Museum, Harvard; "Lady Gudeford" by Hans Holbein, the Younger, by the City Museum, St. Louis; "The Dance" by Jean Baptiste Pater, by the Worcester Art Museum; "Joshua Heneshaw" by Copley, by Palace of the Legend of Honor, San Francisco; "St. George and the Dragon," a French primitive, and Landscape by Cezanne, by Toledo Museum; Landscape by Albert P. Ryder, by Carnegie Institute; "Croquet" by Winslow Homer, Still Life by Manet, "Polycrates Received the Fish" by Salvator Rosa, by the Art Institute of Chicago.

The Modern French and American Schools were not as much neglected as this might seem, various works by their leading exponents finding their way on further lists of Museum purchases.

Sales. With the many restrictions placed on wartime spending it was astounding to learn at the close of the season of 1942-43 that the auction sales of art conducted by the Parke-Bernet Galleries in New York during that period had amounted to \$3,611,847, the second highest in ten years; the highest amount realized by any one collection was \$266,207 given for that of Mr. and Mrs.

Charles F. McCann.

One of the most notable sales of the season was of American furniture and objets d'art assembled by Mr. and Mrs. Vincent Lockwood, the former long a leading authority on the subject. The highest price at this sale—\$1,650—was paid for a New Hampshire block front secretary of maple with scrolled pediment made in 1782. For a child's inlaid scrutoire on frame the Metropolitan Museum paid \$1,060. The Victorian collection assembled and sold by Mrs. Juliana Force, Director of the Whitney Museum of American Art, is said to have established values for furniture of that era.

Some very distinguished works came under the hammer in the Parke-Bernet sales. These all

Some very distinguished works came under the hammer in the Parke-Bernet sales. These all brought good prices. For example, a painting by Franz Hals of *The Reverend Caspar Sibelious*, from the Frank D. Stout Collection, brought \$30,000, and *The Vintager* by Velasquez, \$15,000. A complete copy of volume 1 of the original folio edition of Audubon's *Birds of America* sold for \$3,900. *Adam and Eve* by Dürer, an engraving, sold for \$3,900, Rembrandt's etching *The Three* for \$2,600, and Bartolozzi's stipple engraving of *Miss Farron* as painted by Lawrence. \$1,000.

ing of Miss Farron as painted by Lawrence, \$1,000. Works by French Impressionists have continued to hold attention and maintain high price. To this fact the sale of the Frank Crowninshield collection at the Parke-Bernet Galleries in October bore ample testimony. At this sale of paintings, drawings, prints, and illustrated books, \$181,747 was spent. The books alone brought \$50,382. They were chiefly those classics of French literature published by Vollard and others in Paris, which famous contemporary French artists had illustrated. Almost all the purchasers were said to be newcomers not yet known as collectors.

Late in December the J. P. Morgan Collection, comprising 42 old-world masterpieces, was exhibited and privately sold at the Knoedler Gallaries, New York, to liquidate the Morgan estate. The total value of this collection was placed, previously, at \$2,000,000 but no report was made of the amount realized at this final sale. Works by Rembrandt, Van Dyck, Goya, Gainsborough, and

others were included in the catalogue.

ASBESTOS. Failure of Canadian spinning fiber, upon which the United States depends for most of its requirements, to keep pace with consumption left this country at the end of 1943 with a minimum inventory. An anticipated shortage in certain fiber grades, notably 3F, 3K, 3R, and 3T, forced the War Production Board to impose more stringent use control, effective November 1, by revision of Order M-79.

Conversely, fiber from Africa, the second principal source for the United States, was received on schedule in sufficient quantities to meet all needs and provide satisfactory inventories at the end of the year. To encourage its use, WPB ordered that no person should process Canadian

spinning fiber grade 3R for textile purposes in greater proportion than five tons for every one ton of Rhodesian fiber grade C & G/3. Since January, 1943, fiber from the two leading African producing companies has been imported by the Federal government, and allocated upon the basis of urgency. At the end of the year, there was discussion of returning the purchase function to private companies during 1944.

Domestic production, mostly in the shorter grades, probably amounted to less than five per cent of total requirements during 1943. Arizona and Vermont were principal producing States, with activity in North Carolina, Georgia, and Cali-

fornia

Chrysotile asbestos, the variety most often employed by industry, is produced principally in Canada (in the province of Quebec), Rhodesia, Union of South Africa, Swaziland, and Soviet Russia. The last-named country stands next to Canada on a tonnage basis, most production being in the shorter grades and coming from the Bajenova district of the Urals. Rhodesian chrysotile, characteristically low in iron, is particularly fitted for electrical insulation.

Amosite asbestos, mined only in Africa, is in demand for lightweight insulation. Long, strong fibers contribute to its superiority for insulation of warship steam machinery. It is also employed for making 85 per cent magnesia pipe covering and block insulation of a similar type that contains no

magnesia

Crocidolite (blue asbestos) is preferred to asbestos-cement pressure pipes, chemical filters, and acid-resistant packings. Long blue fiber is used in making gas masks. This variety is mined principally in Africa. (The Union of South Africa is unique in that it has produced, in varying amounts, five kinds of asbestos—chrysotile, crocidolite, amosite, anthophyllite, and tremolite.) Some crocidolite of premium quality is mined in the rugged Hammersley ranges of western Australia.

Although its production is limited by comparatively small demand, most occurrences in the United States are of the amphibole varieties, anthophyllite and tremolite. The latter, acid resistant,

is used for making chemical filters.

Production figures and imports have not been released since September, 1941 (see 1943 Year Book).

Area and Population. The area of the six States and two Territories, the census population of June 30, 1933, and the estimated population on Sept. 30, 1942, exclusive of aboriginals, are shown in the accompanying table.

AREA AND POPULATION OF AUSTRALIA

| States and         | Area in   | Popu          | lation         |
|--------------------|-----------|---------------|----------------|
| Territories        | sq. miles | June 30, 1933 | Sept. 30, 1942 |
| New South Wales    | 309,433   | 2,600,847     | 2,841,514      |
| Victoria           | 87,884    | 1,820,261     | 1,968,271      |
| Queensland         | 670,500   | 947,534       | 1,034,975      |
| South Australia    | 380,070   | 580,949       | 608,740        |
| Western Australia  | 975,920   | 438,852       | 470,649        |
| Tasmania           | 26,215    | 227,599       | 239,706        |
| Northern Territory | 523,620   | 4,850         | 8,555          |
| Aust. Capital Terr | 939       | 8,947         | 12,231         |
| Totals             | 2,974,581 | 6,629,839     | 7,184,641      |

For the calendar year 1942 living births numbered 136,709; deaths, 75,193 (excluding deaths of Defense personnel, of internees, and of prisoners of war from overseas); marriages, 86,060. The excess of births over deaths in 1942 was 61,516. Net immigration, 1941, was 5,184. The aboriginal population at the census of June 30, 1940, totaled 73,271 (full-bloods, 47,960; half-castes, 25,311). Estimated populations of the chief cities (all of them State capitals) on Dec. 31, 1940: Sydney (N.S.W.), 1,310,530; Melbourne (Victoria), 1,076,700; Brisbane (Queensland), 335,520; Adelaide (S. Australia), 330,000; Perth (W. Australia), 228,000; Hobart (Tasmania), 66,620. The population of Darwin (Northern Territory) was 3,900; Canberra (Federal Capital Territory), 11,000.

Overseus Territories. Under the Commonwealth's political control are the Territory of New Guinea, Territory of Papua, Nauru (mandated to the British Empire), and Norfolk Island (see separate articles on each). Papua and New Guinea were merged in the single territory of Papua in 1942. Also under Australian sovereignty are the Territory of Ashmore and Cartier Islands, off the northwest coast of Australia, and the uninhabited Australian Antarctic Territory, comprising all land except Adelie Land, situated south of 60°S. latitude and between 160° and 45°E. longitude.

Education and Religion. Elementary education is free and compulsory. Less than 4 per cent of the adult population is illiterate. In 1939 there were 9,940 State schools of all types with 927,206 enrolled pupils, 1,863 private schools with 250,860 pupils, and eight universities with 14,236 students. Free kindergartens in 1940 numbered 78 with an average attendance of 3,570 pupils. Religious affiliations at the 1933 census were: Church of England, 2,565,118; Roman Catholic, 1,161,455; Presbyterian, 713,229; Methodist, 684,022; Catholic

(undefined), 127,542.

Production. The total area under crops for 1940-Production. The total area under crops for 1940–41 was 21,118,189 acres; yields of the chief crops for the same year were: Wheat, 82,233,324 bu. from 12,644,646 acres; oats, 10,199,218 bu.; corn, 9,192,744 bu.; hay, 2,177,470 tons; cane sugar, 806,457 tons. Wheat production in 1942–43 was provisionally estimated at 156,820,000 bu. from 9,554,759 acres (166,632,967 bu. from 12,062,682 acres in 1941–42). Provisional 1941 livestock returns showed 125,194,587 sheep, 13,590,172, catturns showed 125,194,587 sheep, 13,590,172 cattle, 1,616,672 horses, and 1,416,594 hogs. The 1941-42 wool clip was estimated at 1,130,000,000 lb. as in the grease. Butter output for the same fiscal year was about 168,711 tons, cheese 29,732 tons, bacon and ham 95,071,400 lb.

The value of all mineral production in 1940 was £40,002,669, of which gold accounted for £17,519,950 and coal (black and brown) for £8,327,-341. The 1942 gold output was provisionally reported at 1,155,804 fine oz., valued at £12,080,-245. Wartime production figures for pig iron, copper, lead, silver, tin, and zinc were not available for publication. Manufacturing statistics for 1940-41 were: Number of establishments, 27,300; number of employees, including working proprietors, 650,073; salaries and wages paid, excluding income of working proprietors, £137,919,068; value of total output, £644,794,908, of which £257,-914,349 was added in process of production.

The total gross value of Australian production for 1940–41 was £550,754,000, divided as follows: Agricultural, £71,398,000; pastoral, £111,-232,000; dairy, poultry, and bee-farming, £62,523,000; forestry and fisheries, £16,847,000; mining, £40,003,000; manufacturing, £248,751, 000 (net value).

Foreign Trade. Merchandise imports for the year ended June 30, 1942, were £149,355,797 (£108,-780,000 in 1940-41); exports, £127,208,381 (£107,445,000 in 1940-41). For the main export items by value, see 1942 YEAR BOOK.

Finance. Receipts and expenditures of the Federal Consolidated Revenue Fund were estimated to balance at approximately £294,459,156 in 1942–43 and at £345,120,000 in 1943–44 (years ended June 30). The accompanying table shows actual receipts, expenditures and loans in 1942–43 and budget estimates for 1943–44.

The aggregate debt of the Commonwealth and State Governments on June 30, 1943, was £2,006,000,000 (Commonwealth, £1,107,000,000; States, £899,000,000). The official exchange rate of the Australian pound was \$3.228 during 1941-43.

Transportation. Government railways open for traffic in 1941–42 extended 27,241 miles; they had gross revenues of £66,482,000 and working expenses of £51,043,000. Highways aggregated 488,749 miles in 1940 and motor vehicles registered Mar. 31, 1942, numbered 770,883. Provi-

夏暖号

sional civil air traffic statistics for June-December, 1942, were: Passengers, 85,391; mail, 630,000 lb.; freight, 1,086,000 lb. Radio broadcast listeners licenses in force Mar. 31, 1943, totaled 1,393,872. A total of 3,814 ships of 13,545,712 tons entered and cleared Australian ports in 1938-39.

Government. Executive power is vested in the King, who acts through a governor-general and a ministry responsible to the Federal Parliament. There is a Senate of 36 members (6 from each State), elected for 6 years and renewed by half every 3 years, and a House of Representatives of 75 members apportioned among the States on a population basis and elected for 3 years. Governor-General, Brig. Gen. Alexander Gore Arkwright, Baron Gowrie, who assumed office Jan. 22, 1936. Prime Minister in 1943, John Curtin, heading a Labor Government formed Oct. 6, 1941. Australia entered into a state of war with Germany Sept. 3, 1939; Italy, June 11, 1940; Japan, Finland, Rumania, and Hungary, Dec. 8, 1941; and Bulgaria, Jan. 6, 1942. For 1943 developments, see below.

#### HISTORY

Japanese Threat Banished. After a conference with Gen. Douglas MacArthur, U.S. commander-inchief of all Allied forces in the Australian-New Guinea area, Prime Minister Curtin on June 10, 1943, announced that the holding phase of the war was over for Australia and that the period of counter-attack had arrived. This prediction was borne out by new Allied offensives in the Solomon Islands and New Guinea that drove the Japanese out of bases from which they had threatened to attack Australia (see World War for a description of these campaigns). Thus the great tide of Japanese aggression that threatened to sweep over the Commonwealth in the spring of 1942 and was halted temporarily in the fringe of islands to the north was now definitely broken and sent reeling backward.

The danger that the Japanese would break through the Allied defenses in New Guinea and the Solomons and renew their threat to the Australian mainland remained acute throughout the first four months of 1943. This danger led the Curtin Government to recall the veteran Ninth Australian Division from the Middle East, where it had played a heroic role in the defense of To-bruk and in the Battle of El Alamein. With the return of the Ninth to Melbourne early in April, there remained in the African-European war theater only Australian air and ground units.

Two other Australian divisions sent to the Middle East at the outbreak of the war had been withdrawn to meet the Japanese threat early in 1942. The Government on April 12 also reduced the recruiting age for the Australian Imperial Forces from 19 to 18 years. The expansion of the militia forces through conscription produced the second of the supplier of the second of the militia forces through conscription was continued despite the increasingly serious shortage of man-power. By the end of July there were 780,000 men and 40,000 women in the fighting services; volunteers in the Australian Imperial Force, the Royal Australian Air Force, and the Royal Australian Navy totaled 530,000 and members of the conscripted militia 290,000. (See Naval Progress.)

In addition to these home defense measures, the Curtin Government and General MacArthur pressed the Combined Chiefs of Staff in Washington and the British and American Governments for increased forces to meet what was said to be a growing concentration of Japanese strength in the islands north of Australia. Late in February Herbert V. Evatt, the Minister of External Affairs,

was sent on another visit to Washington and London to protest against the "holding" role assigned to Allied forces in the Southwestern Pacific. General MacArthur sent his Chief of Staff and his air

commander to Washington on a similar mission. Simultaneously with the announcement on March 4 of the complete destruction of a Japanese convoy in the Bismarck Sea, the House of Representatives in Canberra was informed that several complete squadrons of Spitfire planes had been delivered to the R.A.A.F. by the British Government. Returning to Sydney on July 30, Dr. Evatt stated that President Roosevelt and Prime Minister Churchill had agreed to "very substantial allocations" of additional aircraft to the R.A.A.F. Large reinforcements meanwhile had reached the United States land, sea, and air forces deployed under General MacArthur and Admiral Halsey.

Prime Minister Curtin announced June 24 that American land forces in the Southwest Pacific were equal in number to the Australian forces there and that United States air squadrons were numerically stronger than the R.A.A.F. On September 21 General MacArthur issued a statement from his New Guinea headquarters criticizing any Pacific strategy involving an "island hopping" cam-paign against Japan. His statement was considered a protest against the military decisions taken by Anglo-American political and military leaders at the Quebec Conference (see United Nations).

MacArthur's seeming resentment at the alleged neglect of the Southwest Pacific command found support in some Australian circles. However Prime Minister Curtin on September 28 said the Quebec decision to create a Southeast Asia command under Lord Louis Mountbatten did not impinge upon MacArthur's command or subordinate it in any way. In an interview on October 1 Curtin declared for the first time that Australia was prepared to provide her share of troops for a campaign to recover the Philippines. The Cairo Conference and its decisions (see United Nations) caused general pleasure in Australia. MacArthur and Curtin again met early in December to consider means of implementing the Cairo decisions. On December 3 Curtin announced that Australia "will shift its entire strategy to the offensive and will give the maximum of which it is capable in men, material, and resources." Some uneasiness was reflected in the Australian press lest the "MacArthur for President" campaign in the United States interfere with the prosecution of the war in the Southwest Pacific.

War Casualties. From the outbreak of war to Aug. 31, 1943, Australian forces suffered 61,564 casualties. Of these, 13,908 were killed in action or died of wounds, sickness, etc., 14,702 were wounded, 20,828 were taken prisoner, and 12,-131 were listed as missing. The Australian hospital ship Centaur, brightly illuminated to distinguish it from war vessels, was sunk by a Japanese submarine the night of May 11 with the loss of about 268 lives. Australian feeling toward the Japanese was intensified in October by the disclosure in a Japanese soldier's diary picked up in New Guinea that the Japanese had beheaded a captured Australian airman. Moreover travelers reaching South Africa from French Indo-China in November reported that 22 Australians had been beheaded for undisclosed reasons out of the 965 Australian war prisoners held by the Japanese in that country. The remaining prisoners were stated to be in a pitiful condition.

U.S. Relations. Relations between Australia and the United States in the military, economic, and political fields remained on an extremely cordial and cooperative basis during 1943. Without formal request from Washington, the Commonwealth Covernment on February 18 accorded the United States most-favored-nation treatment on tariffs. Supply Minister John A. Beasley on March 3 announced that the Commonwealth had accepted responsibility for feeding United States forces throughout the South and Southwest Pacific areas. Australia fed all Allied forces in MacArthur's Southwest Pacific command and aided New Zealand in feeding all those in Admiral Halsey's South Pacific command. The cost to the Commonwealth Government of reciprocal aid to the United States increased from £59,000,000 in the 1942–43 fiscal year to an estimated £100,000,000 in 1948–44 or one-sixth of the Australian budget. However the lend-lease balance in the United States' favor was £81,000,000 as of July 1, 1943, and was scheduled to increase by £100,000,000 during the ensuing year.

Speaking before the House of Representatives

Speaking before the House of Representatives on the first anniversary of General MacArthur's arrival in Australia from the Philippines, Prime Minister Curtin declared that the general "not only has been a great organizer against our common enemy but has become the inspiring force in this nation." A public opinion survey in May showed 77 per cent of the Australian people in favor of granting the United States naval and air bases in Australia for a limited period after the war. Mrs. Franklin D. Roosevelt, visiting Australia in September as a representative of the American

Red Cross, received a warm welcome.

Empire Developments. Prime Minister Curtin's insistence upon a greater voice for Australia in shaping Empire and Allied war policies had won for the Commonwealth during 1942 a nonvoting seat on the British War Cabinet and representation on the Pacific War Councils in London and Washington (see 1943 Year Book). In a statement on August 14, elaborated on September 6, Curtin advanced a new proposal for the establishment of a supreme consultative body within the Empire to handle mutual problems and to join with the United States and other Allied powers in the planning of postwar reconstruction. The Canadian and South African Governments showed no enthusiasm for this proposal, but it was scheduled for discussion at the conference of Dominion Prime Ministers scheduled to be held in London early in 1944. The appointment of the Duke of Gloucester, brother of George VI, as Governor General of Australia was announced November 15. He was slated to relieve Lord Gowrie in July, 1944.

In a campaign speech on August 4 Foreign Minister Evatt said that he would seek to conclude arrangements with Britain, the United States, the Netherlands, Portugal, and France for the establishment after the war of "a zone or security in the Southwest Pacific against aggression... from the arc of islands north of us..."

The Curtin and Evatt proposals for collaboration with other peace-loving nations in promoting world prosperity and security represented a complete break with the Australian Labor party's long-standing policy of isolationism and exclusive nationalism. However the new policy was unanimously approved at the triennial conference of the Australian Labor party held in Canberra in mid-December. The conference gave the Prime Minister a free hand to develop his policy subject to confirmation by the Commonwealth Parliament. Meanwhile Australia and New Zealand tight-

ened the bonds forged to meet the threat of a Japanese attack in 1942. The New Zealand Prime Minister announced on February 12 that as a result of the political-military discussions held the preceding July, the two Dominions had pledged mutual aid in the event of an attack. Cooperation between Australia and New Zealand in supplying food to Allied forces on islands of the South and Southwest Pacific was agreed upon at a conference in Canberra early in September of representatives of Australia, New Zealand, the French Committee of National Liberation, and the U.S. Office of Economic Warfare. This program was administered by a special Pacific Supply Division set up within the Australian Department of Supply.

Internal Politics. A general election that returned the Labor party to power, adoption of a measure permitting conscription for military service in the islands north of Australia, and the development of plans for postwar reconstruction were the main internal political developments of the year.

Conscription Issue. A special interstate conference of the Australian Labor party convened in Melbourne January 4 to consider Prime Minister Curtin's proposal for amendment of the conscription act, which restricted the use of the drafted militia forces to the Australian mainland (see 1943 YEAR Book, p. 56). The Prime Minister won the reluctant consent of his party to the partial abandon-ment of its historic opposition to conscription for overseas service. On January 29 he introduced in Parliament a bill authorizing the use of militia and other drafted troops anywhere south of the equator in the zone between the 110th and 159th meridians East longitude, conditional upon the issuance of a special proclamation specifying the particular area of service. The bill was passed by the House on February II and by the Senate on February 18, despite Opposition criticism that it was a halfway measure that had no relation to military or strategic necessities. An Opposition motion removing all restrictions on the use of conscripts outside of Australian territory was defeated in the House 34 to 29 on February 24.

Strike Difficulties. Another challenge to the Gov-

Strike Difficulties. Another challenge to the Government's position and prestige came from elements within the labor unions and the Labor party who opposed the Curtin conscription law and the Government's stringent regulations for the maintenance of war production and essential war serv-

ices.

On New Year's Day about 37,000 Sydney workers took a holiday in violation of the National Security Regulations. Cabinet members vigorously denounced the walkout as "a blot on the nation's war effort" and several hundred of the alleged ringleaders were prosecuted under the regulations. Nevertheless a wildcat strike by 4,000 Sydney stevedores took place at the end of March in defiance of the orders of the workers' union officials. More than 4,000 United States and Australian troops took over the work of loading and unloading ships until the dock workers' strike collapsed. Another one-day walkout by 30,000 workers in the metal trades occurred in Sydney on May 3 after the Government had refused to grant them an extra holiday for Anzac Day, which fell on Sunday. There were repeated short stoppages by the New South Wales coal miners. To check these disturbances, the Cabinet on May 18 issued a "work or fight" ruling authorizing the drafting for national service of any employee or employer in any industry exempted from military conscription who failed to perform his duties,

According to Government spokesmen, the ringleader of these labor disturbances was John Thomas Lang, former Labor Premier of New South Wales and a bitter opponent of Prime Minister Curtin. A showdown between the two men took place at the annual conference of the New South Wales Labor party in Sydney the first week in June. The conference endorsed Lang's expulsion from the Labor party, reaffirmed its opposition to a common front with the Communists, and voted its complete confidence in the Curtin Government.

Despite labor difficulties, Australia's war production reached a high level during 1943, with 48 per cent of the working population in the armed services or engaged in defense construction and the manufacture of munitions. Only 28 per cent of the country's manufacturing capacity was engaged on civilian production. The drawing of too many men from farms and ranches led to dwindling food production and forced the Government in October to announce the rationing of meat, effective in January. On November 12 the Prime Minister announced that Australia would undertake the manufacture of heavy bombers to end its dependency upon foreign aircraft of this

Postwar Reconstruction. Another important issue was the Curtin Government's program for planned postwar reconstruction, the success of which hinged largely on the ratification by the six States of the constitutional amendment adopted Dec. 2, 1942. The measure transferred 14 specific powers from the States to the Federal Government for a period of five years after the cessation of hostilities. Coming before the State Parliaments early in 1943, it was passed unaltered in New South Wales and Queensland, passed with minor amendments in Victoria and Western Australia, passed in substantially weakened form in South Australia, and deferred for a year by the Parliament of Tasmania.

Without waiting for ratification of the amendment, the Ministry of Postwar Reconstruction established Dec. 2, 1942, proceeded with investigations and plans for directing the transition of Australia's economy from a war to a peace basis, and for raising general living standards. In brief, the program called for the rehabilitation of agriculture, expansion of secondary production, decentralization of industry, housing development, slum clearance, intensive national works (especially water conservation and extension of electrical facilities), improved nutrition, better hospital and medical services, the retraining of soldiers and war workers for peacetime jobs, etc.

In addition to its long-range reconstruction program, the Government sought to prevent inflationary economic forces from getting out of hand by boosting the income tax by 30 per cent in February to probably the highest level of any of the United Nations; by greatly extending the price-control system in mid-April; and by broadening both food rationing and food production measures. Attached to the income tax bill was a National Welfare Fund Bill setting aside £30,-000,000 of new taxation annually for a social welfare scheme trust fund to be brought into full operation after the war.

The General Election. The Labor Government's handling of these and other war problems, and the marked improvement in the Commonwealth's military position enabled Prime Minister Curtin and his associates to score an overwhelming victory in a general election held August 21. For the first time since 1914, Labor won firm control of both houses of the Federal Parliament. It cap-

tured 51 of the 74 seats in the House of Representatives and 22 of the 36 seats in the Senate (most of the newly elected Senators were to take their seats in July, 1944). Previous to the election, Labor lacked two seats of having a majority in the Senate and was dependent for its control of the House upon the two Independent members. This precarious balance of power had placed the Government under a serious handicap in prosecuting the war.

The election was precipitated shortly before the expiration of the three-year term of the House by the Opposition coalition, of the United Australia and Country parties. No sooner had Parliament reconvened on June 21 than a no-confidence motion was introduced in the House by A. W. Fadden of the Country party, official leader of the Opposition and Curtin's predecessor as Prime Minister. He charged the Government with weakness in handling strikes, bungling of the food problem, mismanagement of national finances and manpower, and neglect of rural industries. The ensuing debate was embittered by the accusation directed at the Opposition by Minister of Labor E. J. Ward to the effect that an important document pertaining to the former Fadden Government's war policy was missing from the official files. Prime Minister Curtin agreed to the appointment of a Royal Commission to investigate the charge, meanwhile suspending the Labor Minister from his post.

The Government defeated the no-confidence motion on June 24 by a 27-to-26 vote. However the narrow margin of his victory, following recurrent parliamentary crises, convinced Curtin that Parliament as constituted was unworkable, and he called for its dissolution. In the ensuing campaign, the Labor Government stood on its record, while the Opposition demanded a national or all-party government for the duration of the war. Fadden declared that if he regained control of the Government he would renew the ban on the Communist party, which was lifted by the Labor Government Dec. 18, 1942. The Communists, however, made a poor showing in the election, failing to win a single seat. Their membership in March was reported at only 17,000.

The smashing defeat of the Opposition was followed by the dissolution of the coalition by mutual consent on September 22. Fadden remained head of the Country party and former Prime Minister Robert Menzies was elected leader of the United Australia party. At a Labor party caucus on September 20 all members of the previous Labor party Ministry except Minister of Transport George Lawson were reelected for Cabinet positions. Ar-

thur Calwell was chosen to replace Lawson.

In the elections to the State Legislative Assembly held in Western Australia in November the Labor party slightly increased its majority in the

Other Developments. The Cabinet in July approved a decree for the amalgamation of the mandated Territory of New Guinea with the Territory of Papua, effective upon the expulsion of the Jap-anese. Australia's highest court, by a 3-to-2 deci-sion on June 14, declared invalid the Government's suppression of the Jehovah's Witnesses sect under the National Security Subversive Associations regulations. The decision in effect nullified the whole set of regulations.

RONALD STUART KAIN.

AUSTRALIAN ANTARCTIC TERRITORY. See AUSTRALIA under Overseas Territories.

AUSTRIA. A former independent state of central Europe, annexed by Germany on Mar. 13, 1938, and divided on Apr. 1, 1940, into seven administrative districts of the German Reich. Area, 32,369 square miles; population at census of May 17, 1939, 6,650,000, divided into administrative districts as 5,50,000, divided into administrative districts as follows: Vienna, 1,929,976; Lower Danube, 1,697,976; Upper Danube, 1,034,871; Styria, 1,116,407; Carinthia, 449,713; Salzburg, 257,226; Tirol and Vorarlberg, 486,400. Vienna, the former capital, had 1,918,462 inhabitants at the 1939 census; Graz, 210,175; Linz, 131,423.

Roman Catholics comprised 90.57 per cent of the population at the 1934 census; Protestants, 4.38 per cent; Jews, 2.83 per cent (191,481). The 1939 census showed 94,270 racial Jews. Agriculture, manufacturing, mining, and lumbering are the main occupations (see Year Book for 1939, p. 57 for pre-annexation statistics). Iron ore production increased from 1,900,000 metric tons in 1937 to an estimated 3,500,000 metric tons in

1941.

Government. Upon the annexation of Austria, Chancellor Hitler appointed Josef Buerckel as Procurator for the Liquidation of Austria and Reich Commissar for the Reunion of Austria with Germany. Austria was subdivided into seven districts (Gaue), each under a National Socialist responsible to Herr Buerckel in Vienna, who in turn was directly responsible to Chancellor Hitler. Effective Apr. 1, 1940, this system was reorganized. The Nazi leader in each district was given the title Gauleiter (district leader) and Procurator, combining party and state functions, and became directly responsible to Hitler.

History. Reports from both Nazi and anti-Nazi sources in Austria during 1943 indicated a steady growth of unrest, sabotage, and underground war-fare against the Hitler regime. The Nazi authorities retaliated with scores of executions and numerous arrests and deportations. The American Federation of Austrian Democrats made public in New York City in May a manifesto said to have been drawn up at a secret conference of Catholic, Socialist, and other underground leaders in the Austrian mountains and broadcast over a secret Austrian Freedom Station, operating somewhere in Europe. The statement called for constant warfare against the "Nazi-Prussians." Late in July Swiss reports stated that news of Mussolini's overthrow in Italy had been followed by anti-Nazi demonstrative. strations in Vienna and other Austrian cities, which were suppressed by the police.

Apparently Austrian unrest was accentuated by the steady influx of Germans and of foreign industrial workers driven from western and central Germany by the growing Anglo-American air raids. There were frequent reports of the shifting of German war industries to the Austrian provinces dur-ing the first half of the year. In mid-August Swiss sources stated that many departments of the German Government had been moved from Berlin to Vienna. Immediately afterward United States bombers based in North Africa made their first raid into Austria (August 13), striking at the large Messerschmitt aircraft factory at Wiener Neustadt. The subsequent Allied invasion of Italy brought the whole of Austria within easy range of their heavy bombers and led to the evacuation of

many civilians from Vienna. On November 1 the Moscow Conference of Anglo-American-Soviet Foreign Ministers issued a

Declaration in favor of "a free and independent Austria" stating that in the final settlement account would be taken of Austria's own contribu-tion to her liberation (see United Nations). Announcement of this policy was followed by reports of more serious anti-German outbreaks in Austria and of severe repressive action by the Gestapo.

The War Department in Washington announced December 11 that the Austrian battalion in the U.S. Army, in which Archduke Otto von Haps-burg and two of his younger brothers had enlisted, had been disbanded for lack of sufficient volunteers (see 1943 YEAR BOOK, p. 59). See LEND-LEASE; UNITED NATIONS.

AVIATION. See AERONAUTICS. For Aviation Gasoline, see CHEMISTRY under Petroleum; MINES, BUREAU of; Petroleum Administration for War. AVRO YORK. See AERONAUTICS under British Types. AWARDS. See the subject, as CHEMISTRY, MOTION PICTURES, THEATER; also, PULITZER PRIZES; SOCI-ETTES.

AXIS POWERS. The coalition of powers which opposed the United Nations in World War II, comprising Germany, Italy, Japan, Bulgaria, Finland, Hungary, Rumania, Thailand, the puppet states of Croatia, Manchukuo, and Slovakia, and the Nanking puppet regime in China. Dates on which a state of war began between the individual Axis Powers and United Nations are given in the table under WORLD WAR. For a brief description of the alliances and understandings forming the basis of the Axis coalition, see the 1943 YEAR BOOK, p. 59. For the military and other developments during 1948, see World War and the article on each country. See Argentina, Chile, and Colombia under History; PAN AMERICANISM.

AZERBAIJAN SOVIET SOCIALIST REPUBLIC. See Union OF SOVIET SOCIALIST REPUBLICS under Area and Population.

AZORES. A group of nine Portuguese islands in the Atlantic Ocean about 800 miles west of Portugal and some 2,100 miles from New York. Area, 922 square miles. Population (1940 census), 284,755. The largest island, São Miguel (297 sq. mi.), contains more than one-half of the population. Capital and chief seaport, Ponta Delgada (pop. 19,824 in 1940) on São Miguel. The other islands are Corvo, Fayal (64 sq. mi.), Flores (57 sq. mi.), Graciosa, Pico (175 sq. mi.), Santa Maria, São Jorge, and Terceiro (223 sq. mi.). Angra (pop. 11,706) on Terceiro and Horta (pop. 8,407) on Fayal are the other leading cities. The Azores form a province of Portugal and are divided, for political and administrative managinate through districts. ministrative reasons, into three districts—Angra do Heroismo, Horta, and Ponta Delgada. For an account of the 1943 agreement granting naval and air bases to Great Britain for the duration of World War II see Portugal under History.

Agriculture, dairying, and needlework are the chief occupations. The principal crops are corn, hothouse pineapples, sugar beets, wheat, tobacco, and fruits. Imports come mainly from Portugal. In normal times, pineapples are exported to northern Europe and embroidery to the United States. Horta is a seaplane base on Pan American Airways' transatlantic route from New York to Lis-

bon, and an important cable station.

BADMINTON. Despite a falling off in tourney competition, badminton probably gained in popularity during 1943, for many of those thousands of Americans who became "stay-at-homes" because of gasoline rationing discovered that badminton in their own backyards provided great fun and healthy recreation.

The national title tournament was canceled for the first time. Holdover champions are Guthrie Freeman, Pasadena, men's singles; Evelyn Boldrick, San Diego, women's singles; Freeman and Chester Goss, Hollywood, men's doubles, and Miss Boldrick and Janet Wright, San Francisco, women's doubles. THOMAS V. HANEY.

BAHAMAS. A British West Indian colony comprising 20 inhabited and several uninhabited islands and rocks. Land area, 4,404 square miles. Population (1941 estimate), 71,474. Chief islands: Abaco, Acklins, Andros, Bimini, Cat Island, Crooked Island, Eleuthera, Exuma, Grand Bahama, Inagua, Long Island, Mayaguana, New Providence, Rum Cay, and San Salvador (or Watlings). Capital, Nassau (on New Providence), 20,000 inhabitants. Vital statistics (1941): 2,436 births and 1,044 deaths.

Production and Trade. Shell (tortoise and conch), cascarilla bark, pine timber, salt, tomatoes, sisal, and crawfish are the main products. The combined expenditures of the 25,000 tourists who visited the islands during 1941 amounted to \$4,000,000. Sponge fishing was prohibited pending a recovery from the disease which attacked the beds during December of 1941. Trade (1941): imports £1,519,029; exports £301,858. Shipping (1941): 1,377 vessels aggregating 635,666 tons entered. Air services are in operation with the United States, and among the chief islands of the Bahamas.

Government. Budget estimates (1942): revenue £394,690; expenditure £439,889. Public debt (Dec. 31, 1941) £245,000. Executive power rests with the Governor, assisted by an Executive Council of 8 members. There is a legislature consisting of a Legislative Council (9 nominated members) and a House of Assembly (23 elected members). Governor and Commander in Chief, the Duke of Window (assumed office Aug. 17, 1940)

Windsor (assumed office Aug. 17, 1940).

History. The U.S. State Department and the Bahamian Government, on March 16, 1943, made an agreement providing for the importation of Bahamian agricultural workers into the United States. By September about 5,000 Bahamians had gone to work on American farms. On Sept. 15, 1943, the Governor stated that the islands were enjoying the greatest prosperity in their history. They had lost their tourist trade but prosperity was brought about by the construction of airfields,

sugar, rice, coffee and salt pork were placed on ration lists. See Hurricanes.

BALEARIC ISLANDS. See Spain under Area and Population.

BALL See NETHERLANDS EAST INDIES under Area and Population.

BANKS AND BANKING. The banking system completed in 1943 a second year of war financing without any difficulty or extraordinary strain. Through the improved organization of its war loan drives, the Treasury succeeded in expanding sales of new Government security issues to investors other than banks to a point that enabled it to leave banks out of the Third War Loan drive in September, 1943. For the year as a whole, however, the commercial banks not only absorbed some \$16,000,000,000 of additional Government securities in their portfolios, but also facilitated sales of Government securities to other purchasers through an expansion of col-lateral loans against Treasury obligations. The further increase in Government security holdings of the banks produced a corresponding growth in deposits, which increased by some \$10,000,000,000 during the year to the highest level recorded. The Federal Reserve banks provided their members with the additional reserves made necessary by a sharp rise in currency circulation and these added deposits by purchasing Treasury bills to the extent offered by member banks, at the fixed buying rate of % of 1 per cent discount. As a result, despite increased deposits and the expansion of currency in circulation, excess reserves of member banks were maintained around the billion dollar mark through the latter part of the year, after declining from the two billion dollar level in the early months.

The highlights of changes in the commercial banking system as a whole during the year ended June 30, 1943, are shown in Table 1, a comparison of major items from the annual statement of commercial banks insured by the Federal Deposit Insurance Corporation:

the garrisoning of troops, the dispatch of 5,000 farm laborers to the United States, the development of a large fish cannery at Grand Bahama, and the sale of sisal to the United States. Food rationing commenced on July 11, 1943, when lard, white

Commercial Banking. A striking feature of the financing of the present war has been the extent to which the Federal Covernment has provided industry with both the long-term and the working capital required to finance war production. As a result, industries devoted to producing armaments and munitions found it necessary to resort only to a very limited extent to bank loans or new security issues. On the other hand, the volume of Government financing necessary has been far greater than would have been the case if a larger share of war production had been financed through private channels. The impact of the second year of war financing upon the commercial banks of the country from month to month during 1943 is illustrated by the statistics of reporting member banks in leading cities in Table 2.

mercial and industrial loans, which had fallen to approximately \$7,000,000,000 on June 30, 1943. Since June, 1943, a substantial increase in commercial loans has occurred, particularly by banks outside of New York City. A part of this increase reflected bank financing of war production. The Government announced on Sept. I, 1943, a broadening of the basis under which the War and Navy Departments and the U.S. Maritime Commission guaranteed bank loans to war contractors and subcontractors, through the agency of the Federal Reserve banks, up to 90 per cent of the amount loaned. The Government securities purchased by the banks during 1943 were chiefly certificates of indebtedness and notes and bonds falling due within ten years, as shown by the accompanying chart, based on reports received by the Treasury from approximately 5,800 commercial banks.

The decline in commercial loans by banks which characterized the first year and a half of the war came to an end in June, 1943. The total loans of

# COMMERCIAL BANK HOLDINGS OF GOVERNMENT SECURITIES

Based on reports received by the Treasury from approximately 5,800 commercial banks.

all commercial banks aggregated approximately \$17,700,000,000 at the end of that month, representing a decline of approximately \$4,000,000,000 from the beginning of 1942. More than half of this total decrease was represented by a decline in com-

order to assure those engaged in war production that their working capital would not be frozen in the event of Government contract termination, it was provided that the payment of interest on such loans would be assumed by the Government once contracts had been terminated. Such Government guaranteed bank loans to war contractors, providing for the contingency of contract cancellation, were referred to as "VT" loans. During the first nine months of 1943, the amount of "V" and "VT" loans actually outstanding increased by approximately \$900,000,000.

Another reason for the increase in bank loans was the substantial volume of advances made to subscribers to Government security issues. In connection with each successive war loan drive, a sharp increase in loans secured by Government obligations occurred, but such advances were rapidly repaid after the war loan drives were completed.

The continued increase in bank deposits reduced the ratio of capital funds to deposits for most banks well below the traditional 1:10 ratio considered standard in the past. Supervisory authorities noted this development, but felt that it was not serious because of the unprecedentedly high proportion of Government bonds in commercial bank portfolios. However, banks were urged to favor shorter term obligations in adding to their holdings of Government securities, so as to minimize the risk of price fluctuations, and to be conservative in dividend declarations, so as to add to undivided profits and surplus from reinvested earnings. The distribution of maturities of Government securities held by 6,149 commercial banks on Sept. 30, 1943, is shown in Table 4.

TABLE 4—PUBLIC MARKETABLE TREASURY SECURITIES HELD BY COMMERCIAL BANKS

| Due or Callable | Amount Held      |

| FHA. debentures | 7,000,000        |
| Total           | \$54,457,000,000 |

Expansion of Money in Circulation. An accelerated increase of money in circulation was an outstanding development of the year in the banking field. Currency in circulation rose sharply each month during the year, from \$15,410,000,000 at the end of 1942 to over \$20,000,000,000 at the end of 1943. Expanded payrolls and the high level of retail trade contributed to the increase in circu-

banks who retained an option to repurchase them, whenever their reserve position would permit it. Thus, the Treasury bill has become increasingly the chief instrument for credit control in the money market, member banks looking upon their Treasury bill portfolio as a means for securing Federal Reserve credit for whatever period is required through sale of these obligations, under repurchase option,

lation, and large sums were needed to pay the armed forces. The bulk of the increase occurred in smaller denomination currency, although the number of \$100 bills outstanding rose by almost 50 per cent. Black market operations were reported to be a contributing factor to the extraordinary expansion of the volume of cash in circulation.

One of the surprises of the year was the revelation of the ownership of bank deposits shown by a study released by the Federal Reserve Board in October. On the basis of an analysis of the ownership of the deposits in a selected group of banks, the Board estimated that almost 70 per cent of all non-Government deposits were owned by domestic business and financial concerns, and that only a little more than 25 per cent were owned by individuals, including farmers. Nonprofit organizations, such as churches and clubs, owned 2½ per cent of all demand deposits, and foreign businesses and individuals 2.2 per cent. This analysis indicated that the great bulk of the wartime increase in bank deposits was accounted for by corporation deposits, and that individual liquid savings consisted primarily of cash.

The increase in coin and currency outstanding from month to month during 1943 is shown by Table 5.

Credit Control Policy. The Federal Reserve Banks' chief function during the year was to provide mem-

at the pegged buying rate of % of 1 per cent. This policy permits member banks to obtain reserve balances at a cost of % of 1 per cent per annum. It also protects the Government bond market from liquidation by banks, as the latter can obtain any added reserves they require by sale of Treasury bills to the Reserve banks, instead of resorting to liquidation of their Government securities in the open market.

In the two war years 1942 and 1943, the expansion of currency circulation exceeded \$8,000,000,000. Some \$2,000,000,000 of added reserves were required against additional deposits. To meet these greatly increased reserve requirements, member banks obtained some \$8,000,000,000 of new reserves from purchases of Government securities by the Federal Reserve banks, and excess reserves declined by over \$2,000,000,000 during 1942 and 1943. The decline in reserves was particularly severe in large city banks. Nevertheless, no real stringency resulted in the money market because any one bank could get the additional reserves needed by selling some Treasury bills to the Federal Reserve banks, as described above.

One measure of further relief for banks whose

One measure of further relief for banks whose reserve position had become tight was the action of Congress eliminating legal reserve requirements on Government war loan deposits in banks, taken in April. As a result, member banks no longer re-

ber banks with the additional reserves required to support the larger volume of bank deposits and to offset the heavy withdrawals of cash from the banks. This was done chiefly through the purchase of Treasury bills from member banks. The bulk of the Treasury bills acquired by the Federal Reserve banks during 1943 were purchased from member quired additional reserves during the period of the war loans drives, when sharp increases occurred in Government war loan deposits as proceeds of the sale of the new securities were left with the banks.

The Federal Reserve authorities urged the banks to maintain a fully invested position, and not try to maintain excess reserves. Banks in New York and Chicago generally followed this policy, but country banks generally preferred to maintain some excess

The Federal Reserve banks also assumed responsibility for stabilizing Government bond prices, through purchases and sales of various issues when such action was indicated to maintain the interest rate pattern that the Treasury has favored since war began. Under this pattern, interest rates for various maturities of Government securities follow a curve, one anchor of which is the % of 1 per cent Treasury bill rate, and the other anchor the 2½ per cent interest rate on the longest maturities of marketable securities. New offerings, as well as Federal Reserve policy, are adjusted to keep yields on Treasury obligations at these levels.

Changes in the principal items of the combined statement of the 12 Federal Reserve banks from month to month during the year are shown in

Table 6.

World Developments. Currency and bank deposit inflation proceeded apace in all belligerent coun100 per cent in its gold and foreign exchange holdings, and sizeable increases were shown in gold holdings of virtually every other Latin American Central bank. Sales of the yellow metal to these institutions explain why the United States reported a decline of some \$700,000,000 in its monetary gold stock in 1943.

With foreign exchange rates fixed by official regulation, only a few currencies were left free to fluctuate even within narrow limits. These included the free Canadian dollar, the special export Argentine peso, and the free Brazilian cruzeiro. Fluctuations in these three currencies during 1943 are

shown in Table 8.

In all belligerent countries, central banks pursued policies similar to those of the Federal Reserve Banks in that they sought to facilitate Government deficit financing without any consequent hardening of interest rates. The British Chancellor of the Exchequer told Parliament that low interest rates were not only a wartime objective of central bank policy, but that it would be the primary aim also

tries, and to a lesser extent in neutral nations, during 1943. This may be seen from the rise in cur-

rency outstanding shown in Table 7.

With the favorable course of the war, more interest was shown among the United Nations in planning for monetary and banking reconstruction. Holland and Belgium effected a monetary agreement under which each country would allow the other to build up a debit balance up to a specified amount through ordinary commercial and financial transactions, after which discussions would be carried on to work out steps to bring trade into equilibrium. Plans for a simultaneous stabilization of all currencies were formulated by the American, British, and Canadian governments. The United States also advanced a project for a United Nations Bank for Reconstruction and Development.

For the period of the war, normal foreign exchange dealings have been generally suspended.

Through lend-lease (q.v.), the United States is able to maintain a very large excess of exports over imports without causing any strain on other currencies. In fact, apart from lend-lease the United States had a substantial import surplus, chiefly with Latin America. This has enabled Latin American central banks and the central banks of neutral European countries to increase their gold holdings substantially. The Central bank of the Argentine Republic, for example, reported an increase of over

of postwar policy with a view to promoting economic reconstruction and development.

Jules I. Bogen.

BAPTISTS. A religious group, probably evolved from the Anabaptist movement of the 16th century, which adopted the principle that immersion is es-sential to valid baptism. The first Baptist churches were established in Amsterdam in 1608, in London in 1611, and in America, probably at Providence, R.I., in 1639. There are 21 denominations in the United States which use the name *Baptist*, the largest of which are treated below.

Northern Baptist Convention. This body of the Baptist denomination was composed in 1943 of 36 conventions in 33 States, the District of Columbia,

and Puerto Rico.

Owing to the war emergency, the 1943 annual meeting, scheduled to be held in Denver, Colo., was cancelled. Officers elected in 1942 remain in office, with Rev. Joseph C. Robbins as president.

The leading denominational papers are: Baptist Observer (Indianapolis); Baptist Record (Pella, Ia.); Missions (New York); and Watchman-Examiner (New York).

The foreign mission field includes Assam, Burma, South India, Bengal-Orissa, South China, East China, West China, Japan, Belgian Congo, and the Philippine Islands. The work of the Convention covers domestic, city, and foreign missions; higher education, social service, Sunday schools, and pen-

sions for clergy.

The total membership of the Northern Baptist Convention for 1942-43 was 1,556,112, distributed among 7,367 churches, mostly above the Mason and Dixon Line. The total amount of funds received and expended by the churches and their agencies, as of Apr. 30, 1943, was \$17,198,480 for church operating expenses and \$4,451,057 for missions, education, and philanthropy.

Headquarters of the General Council, the executive body to which is entrusted the work of the Convention between annual meetings, are at 152

Madison Avenue, New York, N.Y.
Southern Baptist Convention. This body of the Baptist denomination was formed in 1854, when Southern Baptists withdrew from the national organization. According to the official statistics for 1942, the Southern Baptist Convention comprised 19 State conventions; 25,737 local congregations, and 5,367,129 church members.

The annual session, scheduled to be held at Memphis, Tenn., May 12-15, 1943, was deferred in response to an appeal from the Office of Defense Transportation, Washington, D.C. All the agencies and institutions of the Convention, however, presented their annual reports and went on with their work, until such a time as the Convention could meet in regular session again. Their reports have been gathered up and published as the 1943 Annual of the Convention.

The officers elected for 1942 were continued in 1943, with The Hon. Pat M. Neff, LL.D., of Waco, Texas, as President. The 1944 Convention will meet in Atlanta, Ga., May 16-20. The statistical summary shows a year of very

great progress, as follows:

|                          | 1941          | 1942          |
|--------------------------|---------------|---------------|
| Associations             | 915           | 918           |
| Churches                 | 25,603        | 25,737        |
| Ordained ministers       | 22,747        | 21,986        |
| Baptisms in year         | 209,593       | 209,127       |
| Church members           | 5,238,132     | 5,367,129     |
| Sunday Schools           | 24,629        | 24,745        |
| Sunday School Enrollment | 3,553,467     | 3,430,929     |
| B.T.U. Organizations     | 54,957        | 50,726        |
| B.T.U. Enrollment        | 954,179       | 801,567       |
| W.M.U. organizations     | 41,719        | 40,472        |
| W.M.U. contributions     | \$3,286,252   | \$3,791,755   |
| Church houses            | 23,648        | 23,868        |
| Pastors' homes           | 4,349         | 4,519         |
| Value Church property    | \$232,944,315 | \$240,131,184 |
| Gifts, local work        | 37,035,267    | 42,565,890    |
| Gifts, missions, etc     | 7,822,340     | 9,681,772     |
| Total contributions      | \$44,857,607  | \$52,247,662  |

National Baptist Convention of America. The 63rd Annual Session was held in San Antonio, Texas, Sept. 8-12, 1943. Every Board in the Convention submitted in printed form its annual report of the work done during the interim. The report by the statistician showed a growth of 102,000, bringing the total membership up to 2,176,521. Morris College in South Carolina was adopted as one of the educational institutions, thus increasing the number to five.

Religious intolerance was denounced; mob violence and lynching were condemned; the Four Freedoms, as announced by the President, were commended as a long step in the right direction. An appeal for the return of prohibition was renewed. A request for equal opportunities and advantages for all was urged, along with the enforcement to the letter of the Atlantic Charter in postwar planning.

The following officers were elected: Rev. G. L. Prince, President; Rev. C. P. Madison, Secretary; Rev. A. A. Lucas, Treasurer; Rev. A. L. Roach, Field Secretary; Rev. W. M. Grimble, Corresponding Secretary.

The 64th Annual Session will be held with the First Baptist Church, Beale Avenue, Memphis, Tenn., Wednesday before the second Sunday in September, 1944. The National Baptist Publishing Board, Henry A. Boyd, Secretary, 523—2nd Avenue North, Nashville, Tenn., is regarded as headquarters.

BARBADOS. An island colony of the British West Indies. Area, 166 square miles. Population (Jan. 1, 1942), 197,156. There were 5,786 births and 3,-

902 deaths in 1941. Capital, Bridgetown, 50,000 inhabitants. Education (1941): 138 schools and 30,166 students.

Production and Trade. The chief products are sugar (133,800 tons, 1943), molasses, and rum. Other products are cotton, aloes, tamarinds, and whale oil. In the fishing industry, approximately 300 boats and 1,600 are employed. Trade (1941): imports £2,299,564; exports £1,885,353. Canada supplied 39.7 per cent of the imports and received 63.2 per cent of the exports. Air services are operated by Royal Dutch Air Lines and British West

Indian Airways. Roads (1940): 538 miles.

Government. Financial estimates: (1943–44) revenue £769,432; expenditure £772,370. (1942–43) revenue £660,111; expenditure £657,788. Actual (1941-42): revenue £716,974; expenditure £660,982; public debt £449,170. The executive part of the Government includes the Executive Council (the Governor and 4 other members) and the Executive Committee (the members of the Executive Council, a member of the Legislative Council, and 4 members of the House of Assembly). The Legislature comprises the Governor, the Legislative Council (9 members appointed by the King), and the House of Assembly (24 members elected every two years by the people). Governor and Commander in Chief, Sir H. Gratton Bushe (appointed October, 1941).

## BARBUDA. See LEEWARD ISLANDS.

BARLEY. The barley production of the United States in 1943 was estimated by the U.S. Department of Agriculture at 322,187,000 bu. This represents a drop of 25 per cent from the record crop of 1942, but is still nearly a third larger than the 10-year average of 1932-41. The acreage harvested in 1943 was 14,702,000 acres, compared with the record yield of 16,782,000 for the previous year, but held to a 32 per cent increase over the 10-year average.

| State | Value        | $Acres \ Harvested$ | Production (bushels) |
|-------|--------------|---------------------|----------------------|
| N.D   | \$59,829,000 | 2,652,000           | 63,648,000           |
| Calif | 40,009,000   | 1,299,000           | 36,372,000           |
| S.D   | 34,990,000   | 2.142.000           | 35,343,000           |
| Neb   | 26,801,000   | 1,551,000           | 27,918,000           |
| Minn  | 22,718,000   | 1,228,000           | 22,718,000           |
| Colo  | 16,911,000   | 734,000             | 17.616.000           |
| Kan   | 14,763,000   | 1,110,000           | 15.540.000           |
| Mont  | 13,389,000   | 506,000             | 15,939,000           |
| Idaho | 11.953.000   | 374,000             | 12,716,000           |
| Wash  | 11,232,000   | 300,000             | 11,700,000           |
| Wis   | 10.646.000   | 347,000             | 9,022,000            |
| Ore   | 9,216,000    | 250,000             | 9,125,000            |
| Utah  | 7,239,000    | 151,000             | 7,097,000            |

The average yield per acre, 21.9, dipped below the 1942 yield of 25.5, but compared favorably with the 10-year average of 21.4. In general, the grow-ing season was poorer in 1943 than in 1942 but better than the average. The seasonal average price per bushel received by farmers was estimated at 99.1¢ and the value of production at \$319,216,000.

BARUCH RECOMMENDATIONS. See United States under Manpower and Production.

BASEBALL. The biggest story of the year in baseball did not break until late in November, long after the New York Yankees had won the world series and just about the time major and minor league officials were getting ready to convene in New York and lay plans for 1944.

On November 23, Kenesaw Mountain Landis, baseball's high commissioner, announced that he had barred William D. Cox, youthful president of the National League Phillies, from baseball for

life for gambling on games in which his club was involved. In the most drastic action of his 22-year regime Judge Landis ruled that Cox was permanently ineligible to hold any baseball post, either in the major or minor leagues.

Cox had grabbed the sports headlines earlier in the year when he unexpectedly ousted Bucky Harris as manager of the rejuvenated Phillies and hired the popular Freddy Fitzsimmons as pilot

hired the popular Freddy Fitzsimmons as pilot.

After the removal of Cox by Judge Landis, directors of the Phillies elected 28-year-old Robert R. M. Carpenter, Jr., as president, Cox's stock in the club being bought by Carpenter's father. Fitzsimmons was promptly signed again as bench man-

ager of the team.

When baseball's second wartime campaign opened last Spring many of the most rabid fans were wagering that the majors would be unable to complete a full season. Hundreds of players had been called to the colors and several minor league groups had been forced to suspend operations. But baseball carried through to a remarkably good season and made great contributions to the war effort, the Yankees, New York Giants, and Brooklyn Dodgers alone being credited with the sale of more than a billion dollars worth of war bonds. The sport's contributions to charities including the Bat and Ball Fund for service men, went well over \$2,000,000 and major league clubs collected more than 1,000,000 pounds of scrap metal, 23,000 pounds of rubber, and 12,000 pounds of waste fat, giving away thousands of free tickets for the donations. With service men, and on certain days blood donors, admitted free, the majors had nearly 700,000 free admissions during the season. The teams also played 115 exhibitions in service cen-

Crowds dropped below par in both leagues, although substantial gains were recorded in Washington, Pittsburgh, and Philadelphia, the Phillies more than doubling their 1942 figures. In all, the National circuit attracted 3,800,000 paid admis-

sions and the American 3,300,000.

Although neither pennant race was mathematically decided until well into September it was almost a foregone conclusion as early as August that the Yankees and St. Louis Cardinals would bettle it out for world supremacy in October. The Yanks won their flag by a margin of 13½ games to give Manager Joe McCarthy his eighth victory in the junior circuit and the Cards finished 18

games in front of Cincinnati.

St. Louis, after sweeping over the Yanks in the previous world series, was expected to make a real battle of their 1943 meeting, but New York turned the tables and won by 4 games to 1, Spud Chandler winning the first and fifth contests. The tireless veteran Bill Dickey hit a two-run homer to decide the finale, 2–0, after Mort Cooper, the Cards' big ace, had fanned the first five men to face him. The second battle provided the dramatic highlight of the series. Mort Cooper—the pitcher many said could never beat an American League team—and his brother Walker comprised the battery for St. Louis a few hours after learning of their father's death, and turned back the powerful Yanks for the Cards' only triumph.

With the series cut to one trip by Judge Landis, the first three games were played in New York and the five contests grossed \$1,105,784, with

\$208,373 going to war relief.

The American League also won the annual All-Star contest played the night of July 13 in Philadelphia. Big Mort Cooper again was the losing pitcher, bowing by 5–3 after serving a 3-run homer

ball to Bobby Doerr of the Red Sox in the second

inning

Stan Musial of the Cards, although his stick work was disappointing in the series, was selected for the National League's most valuable player award. The fleet Redbird led the majors in batting with a mark of .357. Chandler was named most valuable in the American, Spud finishing the regular pennant drive with a pitching record of 20 victories and four defeats and an earned run average of 1.67, lowest recorded by a major leaguer in many years. Luke Appling of the Chicago White Sox, paced the junior loop in hitting with .328 and Rudy York of Detroit hit 34 homers to lead both circuits in long-range firing. Bill Nicholson of the Chicago Cubs was first in homers in the National League, driving 29. Nicholson also topped the majors in runs batted in with 128 and York led his league with 118.

Toronto won the International League pennant, but Syracuse triumphed in the Governor's Cup series, while Milwaukee was victor in the American Association. Columbus captured the little world series, Los Angeles finished on top in the Pacific Coast League and Nashville captured the

Southern Association flag.

THOMAS V. HANEY.

## BASIC ENGLISH. See EDUCATION.

BASKETBALL. The court game, despite the handicaps of restricted travel and player losses, rolled on to a new high in popularity in the 1942–43 campaign. New York's Madison Square Garden was the basketball center of the nation, the big Eighth Avenue arena attracting the record number of 512,526 persons to see its program of 18 college double-headers, post-season tourneys, and high school contests.

Both the National Invitation and National Collegiate Athletic Association tournaments were held on the Garden court, St. John's University of Brooklyn winning the invitation play by routing Toledo, 48–27, in the final round, while Wyoming captured the N.C.A.A. crown with a 46–34 triumph over Georgetown. The winners were then matched in a benefit game that netted \$28,000 for the Red Cross and Wyoming took undisputed claim to national collegiate laurels by beating St. John's, 52–47, in an overtime thriller before 18,316 fans. The remarkable Ken Sailors and his Wyoming Cowboys proved just a little too much for St. John's high-scoring giant, Harry Boykoff, the speedy Fuzzy Levane and Co.

Throughout the East, basketball produced keen competition and drew good crowds. Attendance at the Garden, where most of New York's big contests take place, showed a gain at the gate for the

ninth successive year.

Dartmouth captured the Eastern Intercollegiate League title for the sixth straight season, Illinois retained the Western Conference championship, and Washington succeeded Stanford as Pacific Coast ruler. Other college champions were Kansas, Big Six; Creighton, Missouri Valley; George Washington, Southern Conference; Tennessee, Southeastern, and Texas and Rice, co-winners in the Southwest circuit.

The Davenport A.I.C. of Iowa repeated in the women's national A.A.U. tournament and the Phillips 66 Oilers of Bartlesville, Okla., took the men's title. The Columbus Council Knights of Columbus of Brooklyn were first in the Eastern Amateur Athletic Club League and the Philadelphia Sphas came through on top in the American Professional

League. James Madison High won New York City P.S.A.L. honors and La Salle Academy was best in the C.H.S.A.A.

BEIGIAN CONGO. A Belgian colony in west central Africa. Area, 902,082 square miles. Native population (Jan. 1, 1942), 10,363,909 (mainly of Bantu and Sudanese origin); white population (Jan. 1, 1943), 33,226 (22,915 Belgians, 2,200 Portuguese, 1,200 Italians, and 1,200 British). Chief towns: Leopoldville (capital), 36,641 inhabitants in 1940; Elisabethville, the principal mining center, 18,023; Matadi, the chief port; Stanleyville, Jadotville, Coquilhatville, and Boma. Fetishism is the dominant religion of the natives. Christian mission work has been actively carried on. On Jan. 1, 1941, there were 525 mission centers and 3,862 missionaries. Education (1941): 5,285 schools and 265,170 students enrolled.

Production. The chief agricultural products are coffee, sugar, cottonseed, groundnuts, palm oil and kernels, and cotton. Other crops were rubber, bananas, com, cacao, rice, and tobacco. Mineral output (1942): copper 168,000 tons, zinc concentrates 28,000 tons, cassiterite (tin) 28,000 tons, manganese 27,000 tons, diamonds 5,500,000 carats, cobalt 1,800 tons, wolframite 269 tons, tantalocolombite 126 tons, refined gold 16 tons. Iron, lead, coal, silver, cadmium, salt, uranium, and radium were other mineral products. The annual output of copal amounts to 17,000 tons.

Foreign Trade. In 1941 imports were valued at 1,477,728,141 francs and exports at 3,256,613,428

Foreign Trade. In 1941 imports were valued at 1,477,728,141 francs and exports at 3,256,613,428 francs. On Jan. 21, 1941, the established exchange rate was: £1 sterling equals 176.625 Congolese francs. The main import items were machinery, textiles, metals and metal manufacture, vehicles, and coal. Products forming the chief exports were copper, gold, cotton, precious stones, palm oil, palm nuts, coffee, and copal.

Transportation. The Congo and its tributaries provide 8,000 miles of navigable waterways. Matadi, Boma and Banana are the principal seaports. Of more than 20 river ports, the chief ones are Leopoldville, Stanleyville, and Luebo. Highways extend 50,000 miles; railway lines, 3,500 miles; interior air lines, over 2,000 miles. A Pan American Airways service links Leopoldville with New York via Natal, Brazil.

Finance. Estimates (1942): revenue and expenditure balanced at 1,123,892,000 francs. In 1941 revenue amounted to 920,563,800 francs and expenditure to 806,714,574 francs. Public debt (Jan. 1, 1940), totaled 5,841,941,679 francs. Official exchange rate in 1942: one Congolese franc equalled \$0.0226.

Government. The administration is under the control of the Belgian Minister for the Colonies, aided by a colonial council of which he is the president. The Belgian Government-in-exile in London is represented in the colony by a governor general (aided by a vice governor general, state inspectors, and six provincial commissioners). Governor General, Pierre Ryckmans (appointed September, 1934).

Ruanda-Urundi, Territory of. Two districts mandated to Belgium by the League of Nations. Area,

20,152 square miles; population (Jan. 1, 1940), 3,775,335, all natives except for 1,404 Europeans. Capital, Usumbura. Cattle raising is an important industry. The chief products are maize, cotton, potatoes, groundnuts, tin, and gold. The territory was united (Aug. 21, 1925), for administrative purposes, with the Belgian Congo and placed under the direction of a vice governor.

History. In order to increase the Belgian Congo's output of tin a large percentage of the European staffs and native workers of the gold mines were transferred to the tin mines. Other native workers had to be recruited and some 25,000 native workers began work in new mines. New plantations were placed in production to provide food for the native workers and their families in the new tinmining area. It was reported during May, 1943, that a large detachment of Belgian colonial troops had arrived in the Middle East to serve with the Allies. See Belgium under History; Chemistry under Foreign; Tin.

BELGIUM. A kingdom of Western Europe, occupied by German military forces in May, 1940. Capital, Brussels. King, Leopold III, who was crowned Feb. 23, 1934; he became a German prisoner-ofwar May 27, 1940.

Area and Population. The districts of Eupen, Malmédy, and Moresnet, ceded to Belgium under the Versailles Treaty, were reannexed to Germany on May 19, 1940, leaving Belgium with an area of 11,393 square miles and an estimated population of 8,294,674 on Dec. 31, 1940 (8,386,553 on Dec. 31, 1938). The official estimate for Jan. 1, 1942, was 8,257,392. The people are of two distinct races, the Flemings, of Germanic stock and the Walloons, of Celtic or Alpine racial origin. French and Flemish are official languages. Estimated populations of the chief cities on Dec. 31, 1938: Brussels and suburbs, 912,774; Antwerp, 273,317; Ghent, 162,858; Liége, 162,229. Living births per 1,000 inhabitants numbered 15.3 in 1939, 13.4 in 1940, 12.0 in 1941, and 12.9 in 1942; deaths, 13.8 in 1939, 16.1 in 1940, 14.5 in 1941, and 14.6 in 1942 (including military casualties). According to the German-controlled press, there were 9,617 living births and 11,432 deaths in the month of January, 1943. The infant mortality rate per 1,000 live births was 73 in 1939, 85 in 1940, 84 in 1941, and 78 in 1942.

Education and Religion. Previous to the war there were (Jan. 1, 1939) 1,222,164 pupils in 13,438 elementary schools, 86,279 students in 273 secondary schools, and 10,775 students in the four universities at Brussels, Louvain, Ghent, and Liége. The German occupation brought education under Nazi control. Many schools, including the University of Brussels, were closed and attendance in others declined. A considerable majority of Belgians professing a religious faith are Roman Catholics.

Production. Previous to the war Belgium's manufacturing, mining, intensive agriculture, and extensive foreign commerce enabled it to support one of the densest populations of Europe (712 per square mile on Dec. 31, 1938). The British blockade and the conversion of Belgium's productive facilities for German war purposes beginning in 1940 reduced the population virtually to the subsistence level (see below under History). The area under cultivation was substantially expanded in 1941 and 1942 and a substantial increase in cereal production was reported. Potatoes, beets, and tobacco are other leading crops. Beet sugar production in 1940–41 was estimated at 231,000

metric tons (237,300 in 1939–40). As of Jan. 1, 1940, there were 245,549 horses, 1,599,837 cattle, and 855,928 swine. Many of these were slaughtered during the ensuing years. Mineral and metallurgical production in 1940 was (metric tons): Coal, 25,605,000; pig iron and ferro-alloys, 1,791,000; steel ingots and castings, 1,896,000. The output of briquets in 1939 was 1,525,190 metric tons; coke, 5,176,650; wrought steel (except semi-finished), 2,202,420. Belgium was an important pre-war producer of glass, paper, cardboard, cement, cotton yarn, rayon, metal products, alcoholic beverages, furniture, etc.

Foreign Trude. Following the German conquest, Belgium's trade was restricted largely to Axis countries and areas under their control. All trade payments were cleared in reichsmarks through the German Clearing Office in Berlin. In 1941 Germany supplied 66 per cent of the imports and received 72 per cent of the exports; the Netherlands, 12 and 13 per cent, respectively; France, 11 and 10 per cent, respectively. According to the German-language newspaper Brüsseler Zeitung, Germany took 72 per cent of Belgium's 1942 exports, France 16 per cent, the Netherlands 6 per cent, and other European countries 6 per cent. The actual trade figures were not published.

Finance. Actual receipts of the German-controlled administration were reported at 8,992,000,000 francs in 1940 and 12,376,000,000 francs in 1941, as against expenditures of 21,400,000,000 francs in 1940 (including occupation costs of 4,500,000,000) and 36,600,000,000 francs in 1941 (occupation costs, 16,300,000,000). Estimated receipts for 1942 were 14,607,000,000 francs and estimated expenditures (excluding occupation costs) 17,425,-

000,000 francs.

Public debt (in millions of francs): 98,202 on March 31, 1943 (consolidated, 57,623; floating, 40,579), as compared with 71,904 on Dec. 31, 1941, and 40,318 on Dec. 31, 1939. The belga, equal to five francs, is the unit of currency for foreign transactions. The Germans in 1940 fixed the official exchange rate of the reichsmark at 2.50 belgas instead of the pre-war rate of 1.67 belgas, thus overvaluing the reichsmark by 50 per cent.

Transportation. Previous to the German invasion,

Transportation. Previous to the German invasion, Belgium had 7,068 miles of railway line, 20,244 miles of highways, an extensive network of rivers and canals which carried about one-fourth of the total merchandise traffic, 8,313 miles of air routes in Europe and Africa (August, 1939), and a merchant fleet of 88 ships totaling 353,997 gross tons. Internal communications were badly damaged by the 18-day German blitzkrieg of May 10–28, 1940, but most of this damage was said to have been repaired by the end of 1941. Including smaller boats not included in the merchant fleet described above, about 350,000 tons of shipping escaped from Belgium to Great Britain at the time of the German invasion. These ships, with their Belgian crews, entered the service of the United Nations. Over half of this tonnage was reported to have been lost through enemy action.

Government. The Constitution of 1831, as amended in 1921, vested executive power in the King, acting through a Ministry responsible to Parliament. See Year Book for 1940, p. 63, for the governmental system existing at the time of the German invasion of May 10, 1940. When the Belgian army capitulated at the order of King Leopold on May 27, 1940, the Belgian Government in Paris repudiated the King's action and assumed the right, granted by the Constitution, to exercise the King's powers while he remained a prisoner of war. The

Belgian Government-in-Exile was transferred to London from Vichy, France, in October, 1940. For its war declarations, see table under WORLD WAR.

The composition of the Government at the beginning of 1943 was: Premier, Minister of Defense, Hubert Pierlot; Foreign Affairs, Communications, Labor, Paul-Henri Spaak; Finance, Economic Affairs, Camille Gutt; Colonies, Education, Albert De Vleeschauwer; Justice, Information, Antoine Delfosse; Ministers without Portfolio, August Edmond de Schryver and August Balthazar. On May 20, 1940, Gen. Baron Alexander von Falkenhausen was named German military administrator of Belgium and northern France. German military governors replaced the Belgian provincial governors, but the central administrative functions in Brussels were retained temporarily by the permanent chiefs of the Belgian governmental departments. For developments in 1943, see *History*.

### HISTORY

German Rule. May 10, 1943, was the fourth anniversary of the German invasion of Belgium. What happened to the Belgian people during those four years was described by the Belgian Information Center in New York (News from Belgium, May 15, 1943, p. 153-4) as follows:

Seven per cent of the Belgian population has been killed, been taken prisoner of war, rots in concentration camps or has been deported to Germany as forced labor. Out of the 8,350,000 inhabitants... nearly 600,000 have suffered or are suffering a terrible fate at the hands of the Germans. During the battle of Belgium, in May, 1940, nearly 7,000 Belgian soldiers and some 10,000 civilians were killed, while out of the soldiers taken as prisoners of war, 75,000 are still in German camps. From the time of occupation up until March of this year, 3,000 Belgian civilians have been executed by the Nazis, 7,500 are in German prisons, and 430,000 have been deported. Several more thousands—the exact number is not known—are in prisons or concentration camps in Belgium. Most of the 3,000 civilians who have been shot were hostages. This number is ten times greater than that of the Belgian civilians who were killed in the 1914—1918 occupation...

German rule became steadily more oppressive during 1943 as Germany's military and economic difficulties increased and as the Belgian people resorted to more and more violent and widespread resistance. The Belgian weekly newspaper La Belgique Indépendante, published in London, reported in September that Allied victories in Russia, Africa, and Sicily had caused a sharpening of the German reign of terror. The number of Belgians deported for forced labor in Germany had risen to more than 500,000. "Every month," the report continued, "the Nazis arrest three or four thousand patriots and take two or three hundred hostages, about 100 of whom are shot. . . . There are few families that have not lost a father or a son, deported or imprisoned. Thousands of students, workmen, and middle-class people are hiding out, preferring to face the cruelest privations rather than work for Germany."

As the manpower shortage in the Reich became more serious, the German authorities in Belgium speeded the process of mass labor conscription authorized by the decree of Oct. 9, 1942 (see 1943 YEAR BOOK, p. 69). A decree of Mar. 6, 1943, required male and female university students to "volunteer" for six months of labor service before March 20 on pain of being deprived of their ration cards. In April the Germans ordered the conscription of all farmers and farm workers born in 1922, 1923, and 1924 for work in the Reich. The number of deportations for forced labor was estimated in September at between 3,000 and 4,000 monthly. Many others were rounded up for work on fortifications or in German war industries in Belgium. Of Belgium's 52,000 Jews, nearly all had been sent

to concentration camps in Germany, Poland, and occupied Russia, according to a statement by the Belgian Government in Exile on June 14.

The economic looting of the kingdom, described in previous Year Books, continued at an accelerated pace. It was reported in April that in the Liége area, once the biggest industrial region of Belgium, all except two or three factories had been ordered closed and the usable machinery shipped to Germany. According to a statement broadcast from London by the Belgian Minister of Justice on Mar. 12, 1943, Germany had accumulated a debt of over 25 billion francs "for compulsory exports extorted from Belgium," which the Germans never expected to pay. "At the same time," he continued, "by round-about means, working more often than not through German private firms, she has gained possession of the controlling shares of numerous mining, metallurgical and textile undertakings, insurance companies, department stores, and the like. Finally, she openly confiscated the so-called enemy property of Jews and non-Jewish Belgians who had left the country."

The growing harshness of the German military administration was reflected in the decree of Apr. 28, 1943, issued by General von Falkenhausen. It ordered that henceforth German law be applied in Belgium wherever possible. The death sentence was made mandatory for the possession of firearms or explosives, the failure to report the known possession of arms and explosives by others, the failure of managers of factories and warehouses to prevent industrial sabotage, and the failure to report information leading anyone to believe that acts of sabotage were being planned. Death was also prescribed for anyone hiding "enemy" soldiers or airmen or failing to disclose knowledge of their presence, for inciting laborers to stop work or dis-turbing 'labor peace," for stealing, receiving, or distributing ration coupons, and for acts of violence against collaborationists or members of their families. The decree imposed the penalty of forced labor for the following offenses: possession of Allied propaganda, membership in unauthorized po-litical associations, and circulating statements "detrimental to the prestige of the occupying power or to the Reich or which might provoke trouble in the occupied territories.

Belgian Resistance. The harshness of the German measures of repression and the systematic ruthlessness with which they were imposed only served to intensify Belgian opposition. Sabotage of communications, industries, crops, and other economic activities of value to the German war effort became a major problem for the occupationary authorities. Attacks by patriots upon German officials and soldiers and upon Belgian Rexists and Frontists collaborating with the Germans were of daily occurrence. The police chief of Brussels, several burgomasters, editors, publishers, and numerous other leading quislings paid with their lives for assisting the conqueror. So did scores of less im-

portant collaborationists.

The deportations for forced labor in Germany provoked open defiance. From his chateau at Laeken where he was held prisoner, King Leopold wrote a letter of protest to Hitler. The Fuehrer replied that the necessities of war forced Germany to continue this policy. Members of the Belgian Catholic hierarchy violently denounced the deportations in a pastoral letter read in all churches on March 21. On March 20 the Belgian Supreme Court of Appeals in a letter to the occupationary authorities denounced them for "reducing the Belgian people to slavery" and committing "injustice"

and wrong which . . . are in opposition, not only to the dispositions of The Hague Convention signed by Germany and Belgium, but also to the imperious demands of conscience." Deputies and Senators of the dissolved Belgian Parliament and other former officials joined in the chorus of protest.

In carrying out the deportations and in other repressive measures the Germans encountered both active and passive resistance from the Belgian courts, the police, and many of the nonpolitical civil servants who were still in office. The German radio in Brussels on March 10 announced the removal from office of Baron Albert Houtart, Governor of Brabant. He was the last to be ousted of the nine Provincial Governors regularly appointed by the King before the German invasion. The Germans in July arrested 112 policemen in the Brussels area, including several district superintendents. Twelve Brussels judges of the Belgian Grand Jury were ousted about the same time for refusing to approve German measures.

Thousands of workers in industrial and coalmining centers went on strike against the deportations in February. The Germans broke the strikes by seizing numerous hostages and threatening to machine-gun unarmed workers. Students at Ghent University struck against the forced labor decree of March 7. There were anti-German demonstrations at both Ghent and Liége universities. The rector of Louvain University was imprisoned for refusing to turn over the student registration lists to the Germans for use in enforcing the labor decree.

Despite the constant threat of betrayal by Belgian quislings and of imprisonment, torture, deportation, or death, the resistance movement steadily gained momentum. Scores of underground newspapers were widely circulated. The anti-Nazi Front of Independence formed late in 1941 strengthened its organization and its preparations for assisting the expected Allied invasion. It united all religious and political groups in a solid anti-German front. Numerous other underground organizations, such as the White Brigade and the Communists, intensified their work of sabotage and espionage. Sabotage of the railways reached such proportions early in the year that the Germans placed Belgian hostages on military trains and created a special corps of troops to guard the lines.

Allied Air Attacks. On April 5 U.S. heavy bombers based in Britain attacked the Erla airplane works and the Gevaert war factory in the thickly populated Mortsel suburb of Antwerp. Both factories were badly damaged, but some of the bombs created havoc in adjoining residential areas. A few days later the R.A.F. bombed the General Motors and Ford factories in Antwerp, which were working on German war orders, and on May 5 U.S. bombers again attacked these works. The German authorities took great propaganda advantage of these raids, asserting that the American and British airmen had ruthlessly sacrified the lives of large numbers of Belgians. They claimed that 2,006 civilians were killed in the U.S. raid of April 5.

The Belgian underground press later reported that only 843 death certificates were made out, and pointed out that the Germans failed to sound the air raid warning signal. The acting Mayor of Antwerp asked General von Falkenhausen to transfer the war factories to port areas separated from the residential sections of the city. Instead the Germans reportedly requisitioned two additional factories in the heart of Antwerp for war work. It was significant that no further Anglo-American raids on factories in thickly populated urban dis-

tricts were reported, even though the London radio on June 21 warned Belgians living near such plants

to move from the danger zone.

Food Shortage. The British Government, with the apparent support of Washington, in March again rejected pleas from Premier Pierlot of the Belgian Government and from Anglo-American churchmen and laymen for relaxation of the blockade to permit food shipments to undernourished Belgian children. The Parliamentary Secretary to the Ministry of Economic Warfare reiterated the Government's contention that such shipments would benefit the enemy directly or indirectly. Reports of the sabotage of crops and food stores by anti-Nazi underground groups seemed to indicate their agreement with the British view. The Germans, however, were reported to have found the Allied food policy one of their most powerful propaganda weapons. The German authorities sought to check the spread of anti-Nazi activities by threatening in July to halve the already insufficient food supply. They also exploited the food shortage to force Belgians to accept work in Germany

According to the Belgian Information Center in New York, the food shortage at the end of June was increasingly acute, with Belgium facing the early prospect of famine. "Two years and a half of semi-starvation," it stated, "has lowered physical resistance to such an extent that the future of

the race is at stake."

Government-in-Exile. The Government-in-Exile in London continued preparations for its return to Belgium and for the prompt initiation of relief and rehabilitation measures as soon as the Germans were driven out. Premier Pierlot outlined the Government's plans in this respect in a broadcast to occupied Belgium on July 21, the 112th anniversary of Belgium's independence. The invading armies, he said, would be accompanied by Belgian military-civilian missions, which would distribute food supplies, establish contact with Belgian patriots, cleanse the public administration of "traitors and collaborators," and arrange for the transfer of the Government to the liberated zone as soon as it was possible to maintain order. The Premier said that King Leopold, "now a prisoner among his people," would again exercise constitutional powers; that Parliament would meet again; and that the Ministers would submit their resignations after seeking Parliament's approval of their actions since the German occupation. A new Government would then be formed, "including in it men who lived through the occupation." He promised "swift, exemplary punishment for all who have given criminal help to the enemy."

On March 18 the Government issued a decree deferring the prelimentary elections which under

On March 18 the Government issued a decree deferring the parliamentary elections which, under the Constitution, should have taken place during 1943. The same decree extended the existing parliamentary mandates until such time as elections could be held. Premier Pierlot pointed out that a similar decree was issued in World War I during the German military occupation. Another decree of March 18 called up for military service all eligible Belgians born between Jan. 1, 1900, and Dec. 31, 1924. In May the Government completed financial arrangements with the Canadian Wheat Board for the delivery of 200,000 tons of wheat upon demand for the relief of liberated Belgium.

Alarmed by the agitation in some British and American circles for "generous" treatment of defeated Germany, Premier Pierlot and several of his Ministers made repeated demands for stern punishment of Germans and Belgian collaborationists responsible for the sufferings of the Belgian people.

The Government also continued its close coperation with the British and American war efforts. It was disclosed April 10 by Minister of Finance Camille Gutt that the Government in March, 1941, had lent Great Britain 3,000,000 oz. of gold to pay for vitally needed war materials purchased in the United States. This loan, equivalent to some three billion Belgian francs, helped to tide Britain over a critical foreign exchange shortage until the adoption of the American lend-lease policy relieved the situation. M. Gutt stated that Britain had since repaid the Belgian loan in full. On April 29 the Belgian Government announced that a large detachment of colonial troops from the Belgian Congo had arrived in the Middle East to serve with the Allies.

In a broadcast to occupied Belgium on February 26, Foreign Minister Paul-Henri Spaak forecast closer military and economic ties between Belgium and Great Britain after the war. He said that Belgium would continue her customs union with Luxembourg and would seek closer cooperation with France and the Netherlands. As a step in this direction, the governments of Belgium, the Netherlands, and Luxembourg on October 21 signed a monetary agreement pegging the Belgian franc and Netherlands guilder at the prewar exchange rate of 1 guilder to 16.52 francs. An agreement specifying the principles and procedures for the provision of reciprocal lend-lease aid to the United States and its armed forces by the Belgian Government was concluded through an exchange of notes on January 30. It supplemented the American agreement to extend lend-lease aid to Belgium, signed June 16, 1942.

At the year's end the British and U.S. Governments were negotiating with the Government-in-Exile an agreement providing for the control of civil affairs in Belgium following the landing of Allied armies. In mid-December it was reported from Sweden that Hitler had appointed Gen. Richard Jungklaus, a trusted Nazi, to replace Lieut. Gen. Baron von Falkenhausen as German military commander in Belgium. BENTONITE. Vastly increased production by steel foundries, which use bentonite as a bonding material for molding sand, has correspondingly brought this versatile clay into war prominence. As with many other minerals, labor was the limiting production factor, reserves and plant capacity being adequate.

Five producers in the Wyoming-South Dakota district account for more than 60 per cent of domestic production. Other deposits are nonswelling therefore mostly unsuitable. Total United States production for 1942, the last year for which statistics are available, set a new record at 374,967 tons according to the Bureau of Mines. For 1941, production was 354,028 tons; for 1940, 251,032 tons. Production in 1943 approximated 1941–42 levels. A fire which destroyed the South Dakota plant of Eastern Clay Products Co., although it was quickly rebuilt, was a factor in reducing total 1943 output.

Use of bentonite in the steel industry increased from 53,872 tons in 1939 to 149,384 tons (40 per

cent of the total tonnage) in 1942. Thirty-one per cent of the total 1942 tonnage was used for filtering and decolorizing oils, 13 per cent in oil well drilling muds, and the remaining 16 per cent in a wide variety of applications including cement, concrete admixture, and filler (other than paint and paper).

and paper).

Reflecting the high quality of the bentonite produced in the Wyoming-South Dakota district, in 1942 its 61 per cent of national tonnage commanded 76 per cent of the national value, which totalled \$2,548,509. For the entire United States the average value in 1942 was \$6.80 per ton which compares with \$6.93 in 1941 and \$7.65 in 1940. Charles T. Post.

BERMUDA. A British colony in the Atlantic, 677 miles southeast of New York. Included in its area are some 360 islands, of which 20 are inhabited. Area, 19.3 square miles. Civil population (1940 estimate), 32,086 (12,319 white, 19,767 colored). Chief towns: Hamilton (capital), 2,978 inhabitants in 1939; St. George. Vital statistics (1941): 23.5 births per 1,000; 13.2 deaths per 1,000; 295 marriages. Education (1941): 29 aided schools and 5,182 pupils; a garrison school, a naval school, and 14 unaided primary schools. The islands contain bases for the British Navy and for the United States military and naval forces (see 1943 Year Book, p. 71).

Production and Trade. Most of the 1,400 acres of land under cultivation bear from two to three crops a year. The chief products are onions, potatoes, lily bulbs, cut flowers, and green vegetables. Arrowroot and bananas are grown. Trade (1941): imports £2,422,106; exports £125,000. In 1942 imports were valued at £2,401,225. The United States, Canada, and Great Britain supplied the bulk of the 1941 and 1942 imports. Shipping (1940): 3,128 vessels aggregating 13,304,639 tons entered and cleared the ports. Bermuda is a port of call on the New York to Lisbon transatlantic air service.

Government. Budget estimates (1942): revenue £713,580; expenditure £783,000. Public debt (1940), £75,000. Bermuda has a representative form of government and laws are enacted by a legislature consisting of the Governor (aided by an Executive Council of 4 official and 3 unofficial members), the Legislative Council (3 official and 6 nominated unofficial members), and an elected House of Assembly of 36 members. Governor, Lord Burleigh (appointed August, 1943). See BRTH CONTROL; HURRICANES.

BERMUDA CONFERENCE. See REFUGEES; UNITED NATIONS.

BERYLLIUM. In great demand as an alloy for copper, beryllium was the object of widespread exploration and metallurgical research in 1943. Alloyed in the approximate ratio of 98 per cent copper, 2 per cent beryllium, this element hardens copper and increases its tensile properties without greatly decreasing electrical conductivity. Beryllium-copper alloys are fabricated into springs, diaphragms, low-sparking tools, and motor parts subject to wear.

The principal ore of beryllium is beryl, Be<sup>3</sup>Al<sup>3</sup> (SiO<sup>3</sup>)<sup>3</sup>, which is typically a pale green, bluegreen, or white mineral that occurs as hexagonal crystals or crystalline masses in pegmatite dikes. Pegmatite dikes containing a few crystals of high-grade beryl occur in nearly every State of the United States, but are widely separated and limited in extent. Therefore most production results when beryl crystals encountered in the quarrying of mica

or feldspar are hand-cobbed and tossed aside to be sold after several tons of ore have accumulated.

Most domestic production is in the Black Hills of South Dakota, with some from Colorado, Maine, New Hampshire, and Wyoming. Output of United States mines was 121 short tons in 1940 and 158 tons in 1941, the last year for which figures are available because of wartime restrictions. Imports were 1,635 tons, all from Brazil and Argentina, in the first nine months of 1941, the last for which figures were released. To stimulate domestic production, Metals Reserve Co., the Federal ore-buying agency, has inaugurated a wartime purchase program, with purchase depots in ten western States. Small lots are purchased on the basis of \$120 per dry short ton for 10 per cent BeO grade ore. For lots over one ton, Metals Reserve pays a premium of \$12 per dry short ton for each 1 per cent of BeO content in excess of 10 per cent, with an equivalent penalty for ore analyzing less than 10 per cent. Minimum grade acceptable is 8 per cent BeO. These may be considered to be market prices. The theoretical content of pure beryl is 14 per cent BeO (5 per cent Be).

per cent BeO (5 per cent Be).

Beryllium-aluminum light alloys are still in the experimental stage. Pure metallic beryllium is principally used for X-ray tubes. Beryllium oxide is utilized in fluorescent lamps, luminescent paints, and special refractories. Ground raw beryl is in demand for ceramics. Transparent beryl crystals of gem quality are prized as emerald and aquamarine. Because of the limited availability of beryllium, electrolytic manganese is substituted widely in alloys. Beryllium is insufficient for war plus essential civilian demands under existing administrative controls according to the War Production Board, being rated as the fifth most critical

metal.

BILLIARDS. In the absence of tournament play in 1943, competition in this age-old pastime was limited to a world pocket billiards challenge match, held in Kansas City, Mo. The veteran artist Andrew Ponzi of Philadelphia dethroned Willie Mosconi of Jackson, Mich., as world ruler in this type of cue play, defeating his rival by the score of 1,250 to 1,050 in their ten-block meeting. The victory brought the title to Ponzi for the third time.

No three-cushion tourney was held, so that crown remained on the aging head of the Old Master from New York, Willie Hoppe, who kept his weapons fit for future challenges by playing a number of exhibitions.

BIRTH CONTROL. The Planned Parenthood Federation of America, Inc., formerly The Birth Control

Federation of America, Inc. and its 34 affiliated State leagues, made marked advances in 1943. Its objectives were not altered but were broadened. They were: to foster the acceptance of child spacing as part of the public health programs of the States; to make information on family planning, both in the spacing of pregnancies and promotion of the fertility of childless couples, available under medical direction, through hospital, public health and extra-mural clinics, as well as through doctors in private practice; to carry on a program of education and service, addressed to physicians, nurses, social workers, labor and management in war industry, industrial hygiene physicians, clergymen, Negro leaders, and the general public, explaining the aims of Planned Parenthood and its potential contribution to family health.

Richard N. Pierson, M.D., who had been President of the Federation for four years, was succeeded by J. H. J. Upham, M.D., former President of the American Medical Association, as President. C. C. Pierce, M.D., continued as Medical Director, and Eva F. Dodge, M.D., became Associate Medi-

cal Director.

In the medical field efforts were continued to interest State Departments of Health in the inclusion of pregnancy spacing in their State maternal health programs, in promoting adequate indemnity programs in industrial plants, in broadening the educational programs of affiliated State Leagues and adding professional personnel to their staffs. The District of Columbia and twelve States were visited by the Federation's staff during the year. At the end of the year, five more States had initiated the inclusion of pregnancy spacing in their public health program of maternal care, bringing the total to 11. The Federation became an associate member of the National Health Council during the year, along with other established health agencies.

Efforts to stimulate better teaching of contraceptive technique in medical schools continued. Although the American Medical Association, at Annual Meetings in 1937 and 1942, had recommended that its Council on Medical Education and Hospitals be instructed to promote in medical schools, thorough and adequate teaching of the various factors pertaining to human fertility and sterility, and although 45 per cent of the Grade A Schools were giving some instruction, the Federation's survey in 1943, indicated that much remained to be done. A teaching manual, a Syllabus for the Theory and Teaching of Conception Control, by W. E. Brown, M.D., of the University of Cincinnati was prepared and sent to all Grade A medical schools by the Federation. Dr. Brown visited and surveyed teaching of contraception in 26 schools. Dr. Upham, in an article in the Journal of the Association of Medical Colleges, stressed the need for adequate teaching of contraceptive measures in such institutions. Over 11,000 copies of Dr. Robert L. Dickinson's manual, "Techniques of Conception Control" were sent on request to general practitioners, and 19,000 copies to nurses. Training institutes for public health nurses on the indications for pregnancy spacing were conducted in Florida, Delaware, and North Carolina.

Research in the field of human fertility con-

Research in the field of human fertility continued during the year. A special committee of the Council on Pharmacy and Chemistry of the American Medical Association did research work in Chemical Contraceptives and its Council on Physical Therapy initiated a cooperative program on the investigation of mechanical articles and devices. No important new discoveries were made

during the year.

Birth Control centers and services totaled 786 at the close of the year: 288 extra-mural; 286 in public health quarters; 211 in hospitals, and 372 of the total supported in whole or part by public funds. Services for treatment of involuntary sterility were listed in the Federation's Clinic Directory, and those seeking such information were referred to hospitals or centers with sterility services,

or to doctors in private practice.

In the field of industrial hygiene, absenteeism, due often to pregnancy or abortion, was found to be a contributing factor in the slow-down of production in plants employing numbers of women war workers. The problem was acute in many areas, and the Division of Industrial Hygiene of the U.S. Public Health Service, recommended, in an outline issued for use in industry, that counselors in plants give women workers "advice on the proper spacing of pregnancy, as a means of protecting the health of the mother and her children." The Director and Associate Medical Director of the Federation visited a number of plants and found that there was no uniform policy on employment of pregnant women, or of safeguarding their health if employed. In cooperation with the Alabama State Department of Health two pamphlets dealing with the problem were published, one addressed to workers and one to management. A radio transcription, "Freedom From Fear," dealing with the problem of absenteeism due to pregnancy, was issued by the Federation for use of its affiliated Leagues and Committees.

was issued by the Federation for use of its affiliated Leagues and Committees.

A new pamphlet, "The Case Worker and Family Planning," was written and sent on request to 2,000 social workers. This group and the nurses are in constant contact with families needing help in pregnancy spacing, and both are in a position to refer such cases to centers or physicians where information can be given them. The Federation's Advisory Committee on social work directed work in this field. The Federation participated, as a kindred group, in the National Conference of Social

Work.

The Division of Negro Service organized an Advisory Council of 46 and a Sponsoring Committee of 146 members, representing national professional, medical, religious, educational, and civic leadership. A pamphlet, "Better Health for 13 Million," was published, reporting on the two public health projects for Negroes, one in a rural and one in an urban area, undertaken to determine whether, given the opportunity, under medical direction, Negroes would use child-spacing information effectively. Results in both areas proved that once such services were provided they would be used by the educationally and economically handicapped in the most impoverished areas.

capped in the most impoverished areas.

A National Clergymen's Advisory Council of the Federation was organized and had nearly 1,000 members at the close of the year. The functions of the Council were in part: to make clear the attitude of its members on the religious values in Planned Parenthood, to emphasize to the clergy their need to inform themselves on child spacing as an integral part of their premarital and marriage counselling, and to answer attacks emanating from religious sources. A preliminary edition of a namphlet on "Marriage Counsel" was printed.

from religious sources. A preliminary edition of a pamphlet on "Marriage Counsel" was printed. A sample mailing to 5,000 clergy of five Protestant denominations, offering them literature on various aspects of Planned Parenthood, elicited a 20 per cent response. None of these were members of the Council, and the mailing was undertaken to test the interest of a group which had not been reached previously.

A large number of magazine and newspaper articles kept the public informed of the work of the Federation and the principles for which it stood. The output of leaflets and reprints was large. The Federation began production of a series of pamphlets on special health problems with the publication (in cooperation with the Virginia League for Planned Parenthood) of "Tuberculosis and Parenthood."

Nine affiliated State organizations, Maryland, Delaware, West Virginia, Florida, Iowa, Tennessee, Virginia, Minnesota, and Missouri, broadened their programs and strengthened their professional staffs, some adding full-time executives. Ohio became affiliated, making a total of 34 State organizations

affiliated with the Federation.

The case of Dr. Wilder Tileston of Connecticut was taken to the U.S. Supreme Court for review. He had asked the Supreme Court of Errors of his State for a declaratory judgment on his legal right to prescribe contraceptives for patients whose lives or health are threatened by pregnancy. The Court's decision was that under the State law, which they pronounced Constitutional, he had no legal right to advise these patients. The U.S. Supreme Court, on February 1, ruled that, since Dr. Tileston did not assert that his life was threatened, "there is no basis on which we can say that he has a standing to secure an adjudication of his patients' Consti-tutional right to life, which they do not assert in their own behalf," thus dismissing the case on a technical point.

Estimates indicated that the largest number of babies in the country's history were born in 1943, refuting the claim that if people have contraceptive information fewer babies will be born. See VITAL STATISTICS. The Federation raised \$190,000

in contributions during the year.

Australia. The regulations issued by the Governor General under the National Security Act in 1942 (see 1943 Year Book) did not affect physicians in private practice nor clinical service.

Bermuda. Health Boards asked the Assembly for aggressive action on the problems of over-population and illegitimacy, stating that they were arranging for a medical lecturer on birth control to visit Bermuda.

France. The Vichy regime continued to suppress birth control and to clamor for a rise in the nation's birth rate, but there was an estimated deficit

of 40,000 deaths over births.

Germany. No reliable national vital statistics were issued, but figures from various cities showed a marked drop in the birth rate. Contraceptives were manufactured and sold in spite of propaganda

aimed to stimulate the birth rate.

Great Britain. Marriage and birth rates were the highest in years. Clinics remained open and active, three new ones being added to the list. Research in comparative value of chemical contraceptives was continued, clinically and in the laboratory, and work on the diagnosis and treatment of sterility was part of the service in some clinics. Lord Horder remained head of the Family Planning Association.

India. Reports on extension of clinical service and training of physicians in contraceptive technique were few during the year. The increase of almost 52,000,000 population in the last ten years was announced, together with the most disastrous fam-

ine in India's history. (See India.)

Japan. Claims that Japan's high birth rate was being maintained, in spite of the war, and that 1,000,000 population was being added annually to the nation, could not be substantiated. Birth control continued to be suppressed rigorously in

Japan.

Puerto Rico. Contraceptive services continued work with the cooperation of various health agencies. The reduction of infant and maternal mortality and still-birth rates, due to better public health facilities, coupled with a continued high birth rate, created a population problem of major proportions for which no solution was being offered.

Europe. No news on birth control activity was allowed to filter through the rigid control exercised by Germany in the occupied countries. The net reproduction rates were low.

BOEING B-17, B-29, and 314. See AERONAUTICS.

BOHEMIA AND MORAVIA. Two provinces of Czechoslovakia, which after being shorn of their Sudeten districts by the Munich Accord of Sept. 29, 1938, were occupied by German troops on Mar. 15, 1939, and proclaimed a Protectorate of the Reich the fol-

lowing day. Capital, Prague.

Area and Population. The Protectorate has an area of 19,058 square miles (Bohemia, 12,525; Moravia, 6,533) and a population estimated at 7,380,000 on Jan. 1, 1940, excluding German armed forces and German citizens immigrating into the Protectorate since 1939. As of Jan. 1, 1939, there were 4,472,353 inhabitants in Bohemia and 2,332,522 in Moravia. The inhabitants are Czechs except for a small German minority. The chief cities, with their 1937 populations, are: Praha (Prague), 962,200; Brno (Brünn), 291,800; Moravská Ostrava, 178,099 in 1935; Plzeň (Pilsen), 124,353 in 1935. The live birth rate per 1,000 inhabitants rose from 14.7 in 1939 to 18.3 in 1942; the death rate, from 13.0 in 1939 to 18.9 in 1942.

Production, etc. See YEAR BOOK for 1939, p. 181–182 for data on Czechoslovakia before the partition. Little statistical information on Bohemia and Moravia has since become available. Agriculture, manufacturing, forestry, and commerce are the principal occupations. Cereals, corn, potatoes, beet sugar, tobacco, and flax are the chief crops. Leading industrial products: Arms, rayon and other textiles, wood pulp, cement, shoes, glass, leather goods, iron and steel products, and innumerable others. Western Bohemia is one of the leading industrial areas of Europe. Estimated mineral and metallurgical production within the former Czech-

dustrial areas of Europe. Estimated mineral and metallurgical production within the former Czechoslovak Republic in 1940 was (in metric tons): Coal, 31,000,000; iron ore, 2,000,000; pig iron, 1,200,000; zinc, 3,000; lead, 4,500; antimony, 900;

bauxite, 1,000; mercury, 100.

Finance. The budget for the autonomous administration of the Protectorate in 1939 was: Receipts, 4,638,000,000 crowns; expenditures, 4,902,000,000 crowns (one reichsmark equalled 10 crowns). With the establishment of the customs union between the Protectorate and the Reich on Oct. 1, 1940, the German tax system was applied to Bohemia and Moravia. The puppet government at Prague thereafter had to obtain its small independent income from other sources. Since 1940 no budgetary accounts have been published. An annual assessment of 2,000,000,000 crowns was levied on the Protectorate by the Reich in 1939; according to a Berlin dispatch of Jan. 2, 1941, this sum was doubled in a new German-Czech agreement conducted at the time.

cluded at that time.

Government. The Berlin Cabinet's decree of Mar. 16, 1939, establishing the Protectorate, stated that Bohemia and Moravia "belonged henceforth to the territory of the Great German Reich." Germany assumed direct control of defense, foreign affairs, communications, transportation, customs, and currency, but declared the Protectorate autonomous in other matters, with its own organs and officials. The autonomous powers extended were purely nominal, being rigidly circumscribed by other provisions of the decree (see preceding Year Book, p. 67). The German Reichsfuehrer appoints a "Reich Protector in Bohemia and Moravia," who "has the task of seeing that the lines of policy laid down by the Fuehrer . . are observed." Baron Constantin von Neurath, appointed as Protector Mar. 18, 1939, was "temporarily replaced" on Sept. 27, 1941, by Police General Reinhard Heydrich, who assumed the title of Deputy Reich Protector.

Heydrich, right-hand man of Heinrich Himmler, head of the Gestapo, was mortally wounded by an assassin on May 27, 1942. On May 28 Hitler appointed Kurt Daluege to succeed him as Deputy Reich Protector. German State Secretary for Bohemia and Moravia, Karl Hermann Frank.

Dr. Emil Hacha, elected President of the Czechoslovak Republic by the National Assembly Nov. 30, 1938, and signer of the capitulation agreement of Mar. 15, 1939, remained in office as President of the Protectorate. Gen. Ing. Alois Eliáš, who became Premier of the Prague Government Apr. 27, 1939, was arrested by the Gestapo Sept. 27, 1941, and condemned to death for treason. He was succeeded by Dr. Jaroslav Krejci. For developments in 1943, see *History* below. Also see separate article on CZECHOSLOVAKIA.

#### HISTORY

German Rule. Throughout 1943 the German authorities of the Protectorate continued their systematic efforts to stamp out the Czech spirit of independence. Wholesale executions, imprisonment, torture, deportation, conscription for labor or military service, economic pressure, manipulation of the educational system, and incessant propaganda were all employed with ruthless German efficiency to induce the Czechs to accept their assigned role as "an inalienable component within the Reich's frontiers." A handful of quislings collaborated, willingly or unwillingly, with the German overlords. But the great majority of Czechs resisted the campaign of mingled oppression and beguilement with fierce determination and implacable hatred. Bohemia and Moravia remained sullen centers of espionage and sabotage, of labor slowdowns and passive resistance. As the tide of war turned against the Axis Powers, the Czechs strengthened their underground organizations, established closer liaison with the Czechoslovak Government-in-Exile in London, and speeded preparations for the day of liberation and revenge.

The price the Czechs were compelled to pay for their resistance was detailed by Minister of State Hubert Ripka before the Czechoslovak State Council in London on July 23. On the basis of a report just received from the Czech underground, he said that the Germans had executed 50,000 Czech men and women, many of them without rial, between Mar. 15, 1939, and May 15, 1943. In the same period, Dr. Ripka reported, about 200,000 Czechs were thrown into German concentration camps while more than 500,000 others were conscripted for forced labor in Germany or German-occupied countries. He said that official German announcements recorded the execution of 3,500 Czechs between September, 1941, and June, 1943, after trial on charges of high treason, sabotage, hiding parachutists, possessing arms, and distributing illegal papers. He pointed out that many more Czech patriots died from torture or were executed without benefit of trial. Nor did his figures include the thousands of Czech Jews who were killed, imprisoned, or deported.

In a warning broadcast by the Prague radio on February 27, State Secretary Frank promised to break Czech resistance with harsher measures applied with "German thoroughness." He disclosed that recalcitrant Czech farmers were being dispossessed to make way for German farmers. On April 27 the Prague radio said that the relatives of President Eduard Benes of the Czechoslovak Government-in-Exile had been imprisoned in realiation for his broadcasts of March 13 and April 23 from London to the Czech people. The

Czechoslovak Information Bureau in New York announced April 27 that it had received confirmation of the execution by hanging of Mme. Franciska Plaminkova, former Senator in the Czechoslovak Parliament and for two decades president of the Czechoslovak Women's Council. On October 29 the Czechoslovak Information Bureau in London reported that German courts-martial at Olomouc in Moravia had sentenced 519 Czech patriots to death, the largest mass death sentence imposed at one place in the Protectorate since the German occupation.

Labor conscription was extended to include all Czech women between 17 and 45 except those with young children in a decree issued February 2 by Walter Bertsch, German Minister of Economy and Labor for the Protectorate. At the same time he made the issuance of new ration books conditional upon registration for war work. Another decree issued by Bertsch on March 29 made owners and managers of closed enterprises personally responsible for the registration of former employees for war work. His labor mobilization drive netted an additional 550,000 Czechs, according to reports reaching London in September. Reports also indicated that the conscription of Czech youths for military and semi-military service in German armed forces was being extended from the Sudeten areas into the purely Czech areas of the Protectorate.

Frick Appointed Protector. A shake-up among the high German officials of the Protectorate took place August 24 simultaneously with the reorganization of Hitler's Cabinet (see GERMANY under History). Dr. Wilhelm Frick, whom Hitler replaced as Reich Minister of Interior, was appointed Reich Protector of Bohemia and Moravia in place of Baron von Neurath. Von Neurath's office had been a purely nominal one since the appointment of Reinhard Heydrich as Deputy Reich Protector on Sept. 27, 1941 (see above under Government). Dr. Karl Hermann Frank, the German State Secretary for Bohemia and Moravia, retained his post but was elevated to the rank of Reich Minister. He assumed formal direction of the Protector's administrative offices and thus became actual ruler of the Protectorate. Frick's position was understood to be largely that of a figurehead. Frank's appointment to the German Cabinet was interpreted as a further step toward the incorporation of the Protectorate in the German Reich. The sole powers retained by the Czech puppet government at Prague concerned local finances, cultural affairs, and the administration of civil courts.

Influx of Refugees. From time to time during the year the German authorities issued additional lists of Czechoslovak men and women active in the liberation movement who were deprived of their citizenship. A list published May 17 in Berlin contained 176 names. Another issued June 30 and July 1 gave the names of 171 Czechs whose property had been confiscated by the Reich. Loss of citizenship was equivalent to the loss of property and was frequently accompanied by the seizure of relatives as hostages. The Germans were said to have imprisoned more than 4,000 relatives of Czechoslovak officials and other emigrées in London. Many of the confiscated properties were turned over to Germans evacuated from the bombravaged cities of western Germany. In October it was estimated that some 300,000 Germans from the western provinces had taken refuge in Prague and other Czech cities.

These refugees were reportedly regarded as unwelcome guests not only by the Czechs but also by the older German inhabitants of the Protectorate. They placed an additional strain upon the scanty food supply. A report presented to the Czechoslovak State Council in London in September stated that the food rations in Bohemia and Moravia were everywhere "under the minimum requirements for nourishment" but that conditions were better in industrial Bohemia than in Moravia, where the Germans were not so much interested in maintaining production.

R.A.F. Raids Skoda Works. Industrial sabotage by Czech workers was supplemented on April 16 by a heavy R.A.F. raid on the huge Skoda munition works and arms factory at Plzen (Pilsen) in Bohemia. Extensive damage was inflicted upon the Skoda plant. German reports, believed to be exaggerated, stated that 800 persons, mostly Czech and German workers, were killed during the raid. With the establishment of Allied airfields in Italy later in the year, German war factories in Bohemia and Moravia were exposed to the danger of more frequent and devastating attacks.

BOK FOUNDATION. See PHILANTHROPY under Foundation Activities.

BOLIVIA. A republic of South America. Sucre is the seat of the Supreme Court and nominally the capital, but La Paz, the largest city, is the actual seat of the government.

Area and Population. Taking into account the Chaco boundary settlement of 1938 (see Year Book, 1938, p. 131 f.), Bolivia has an area estimated at about 416,040 square miles. The population is estimated at 3,533,900, divided racially as follows: White 13.08 per cent: mestico (mired) tion is estimated at 3,555,900, divided facially as follows: White, 13.08 per cent; mestizo (mixed), 27.51; Indian, 52.34; others, 7.07. Foreigners in Bolivia number about 7,500, with Peruvians and Germans predominating. Population of La Paz at the municipal census of Oct. 15, 1942, 301,450. Estimated populations of other chief cities: Cochabamba, 80,000; Oruro, 40,000; Potosí, 85,000; Santa Cruz 30,000; Suore 32,000 Spanish is the Santa Cruz, 30,000; Sucre, 32,000. Spanish is the language of the educated classes. The Indians

speak mainly Quechua and Aymara.

Education and Religion. The illiteracy rate of the population seven years and over was 83.5 per cent in 1900. It still remains high, although all illiterates are nominally required to attend school. The 1936 (latest available) school enrollment was: Elementary, 73,854; secondary, 5,522; special schools, 4,615; universities, 1,482. Roman Catholicism is the state religion but other forms of wor-

ship have full liberty.

Defense. Military training is compulsory. As of Jan. 1, 1941, the active army numbered 9,600; trained reserves, 82,187; active air force, 160. Defense appropriations were 246,000,000 bolivianos in 1943.

Production. Although only 60,000 persons (less than 2 per cent of the total population) are engaged in mining, the industry accounted for 99 per cent of Bolivia's exports in 1941. Agriculture and stock raising support about two-thirds of all Bolivians. The chief crops are wheat, quinoa, corn, rice, barley, sugar cane, cotton, coca leaves, tobacco, and coffee. Manufacturing is confined almost entirely to the production of foodstuffs and beverages, textiles, furniture, tobacco, glassware, chemical products, and other commodities for local consumption.

Tin and silver are the most important minerals, but copper, gold, tungsten, bismuth, lead, antimony, zinc, and petroleum also are produced. The production of fine tin was 38,905 metric tons in 1942 and 42,887 tons in 1941, as compared with the peak production of 46,338 tons in 1929; tung-

sten, 3,363.2 metric tons in 1942. Provisional figures for the chief mineral exports in 1941 in fine metric tons, with the value in pounds sterling in parentheses, were: Tin, 42,740 (£11,978,908); tungsten, 2,613 (£1,136,406); silver, 229 (£545,925); antimony, 14,872 (£531,884); lead 15,654 (£436,687); copper, 7,274 (£379,897). Output of crude petroleum in 1940 was about 110,000 bbl. Beginning Aug. 29, 1942, a pipeline linking the oil wells of southeastern. Politics with Argentian carges the of southeastern Bolivia with Argentina across the River Bermejo began the delivery of crude petroleum to the Argentine Petroleum Monopoly at the rate of 50,000 cubic meters annually. Exports of crude rubber increased to 1,486 metric tons in 1942 as a result of the active war demand. See ANTI-MONY; TIN.

Foreign Trade. Imports in 1941 were valued at £7,769,000 (in pounds sterling of 13.33 bolivianos of 18 pence each to the pound) against £5,-700,000 in 1940; exports, £15,900,199 (£13,-063,641 in 1940). In U.S. dollars the 1941 totals were: Imports, \$31,309,037; exports, \$64,077,805. See *Production* for principal 1941 export items. For distribution of trade by countries in 1941, see

1943 YEAR BOOK.

Finance. Preliminary budget estimates for 1943 balanced at 1,227,000,000 bolivianos compared with actual receipts of about 847,000,000 bolivianos and expenditures of 957,000,000 bolivianos in 1942. Taxes on mineral exports provided about 60 per cent of the 1942 revenue, while 500,281,419 bolivianos of expenditures were set aside for the payment of debts and 510,526,899 for general expenses. Actual receipts and expenditures in 1941 were 1,041,000,000 and 1,018,000,000 bolivianos, respectively.

The boliviano was pegged to the U.S. dollar at 40 to 1 on May 10, 1940, 46 to 1 on June 21, 1941, and 42 to 1 on Feb. 12, 1943. The average official exchange rate of the boliviano was \$0.023 in 1941 and \$0.0215 in 1942; average curb rate, \$0.0185 in 1941 and \$0.02 in 1942.

Transportation. Bolivia in 1943 had some 1,402 miles of railway lines in operation and over 10,300 miles of highways. Construction was continued on the Corumbá-Santa Cruz railway, financed jointly by Brazil and Bolivia, which will provide direct connections between Santa Cruz and the port of Santos, Brazil. In accordance with the 1941 report of U.S. Army engineers (see 1942 Year Book, p. 70), it was decided in 1942 to construct a modern automobile highway between Santa Cruz and Cochabamba (225 miles) with part of the \$25,000,000 credit obtained from the United States (see below under History). Construction was started in 1942 upon the following other main highways: Sorata-Apolo; Oruro-Potosi, Oruro-Independencia, San Antonio-Todos Santos, Uyuni-Ollagiie, Cochabam-ba-Chimoré, Tarija-Fortin Campero, Valle Grande-Lagunillas. Extension of the North Central Railway of Argentina from Yacuiba on the Bolivian frontier to Villa Montes was under way in 1943 (see 1943 YEAR BOOK, p. 81-82).

La Paz is a trunk line station on the Pan American-Grace air route from the United States to Buenos Aires. The same system operates a line from La Paz to Rio de Janeiro via Cochabamba, Santa Cruz, and Puerto Suárez in eastern Bolivia. Lloyd Aereo Boliviano, a Panagra subsidiary, operates domestic airlines from La Paz to Oruro in the south, to Apolo in the Yungas, and to the north-eastern cattle and rubber regions via Cochabamba, Trinidad, Riberalta, Cobija, and Guayaramerin, terminus of the Madeira-Mamoré Railway, Modernization and improvement of airports at La Paz,

Cochabamba, Oruro, Uyuni, Santa Cruz, Riberalta, and Guayaramerin were under way in 1943. Also see History.

Government. The 1938 Constitution (see YEAR Book for 1938, p. 96) vested executive power jointly in the President and his cabinet and legislative power in a Congress of two Chambers. The President is elected for four years by direct suffrage and may not succeed himself. The Senate has 27 members (3 from each department), one-third elected every two years for six-year terms. The Chamber of Deputies has 109 members elected directly for four years and renewed by halves every two years. The suffrage is restricted to male Bolivians of 20 years or over who can read and write and who are inscribed in the Civic Register. President, Gen. Enrique Peñaranda del Castillo, who assumed office Apr. 15, 1940. For developments in 1943, see below.

#### HISTORY

Bolivia Enters War. Continuing the policy of close collaboration with the United States inaugurated in 1941, the Peñaranda Government on Apr. 7, 1943, declared war against Germany, Italy, and Japan. The decree was issued while Vice President Henry A. Wallace was in La Paz on his successful tour of the South American countries. It was followed by Bolivia's formal adherence to the United Nations Declaration of Jan. 1, 1942, through an exchange of notes with Secretary of State Cordell Hull in Washington on May 1. The war declaration of the Wife of the National Secretary of State Cordell Hull in Washington on May 1. The war declaration of the National Secretary of State Office of the National Secretary of State Office of Secretary Office o tion was subject to ratification by Congress, which did not reconvene until August. Congressional approval was finally given on November 26, and on December 4 the Government promulgated a formal war declaration. Two weeks later it was overthrown by a military coup led by pro-Axis military men and civilians.

Labor Conscription. The declaration of war had little significance from a military standpoint. But it was of direct aid to the United Nations war effort. For under the mobilization order contained in the decree, an estimated 10,000 additional workers were conscripted for labor in the mines. This meant increased production of tin, tungsten, antimony, and other scarce strategic minerals for the use of United States and British war industries. An earlier decree of January 24 had given all mine workers the status of army conscripts, thus exempt-

ing them from military service.

The additional workers needed by the mining companies were called up and transported to the mines by the army in accordance with instructions issued by the General Office of Mobilization Coordination (established April 30). Other workers were conscripted for labor on farms and on highways in order to increase food production and facilitate its distribution—a measure prompted by the difficulty of maintaining the normal heavy flow of food imports. According to Bolivian officials, all labor conscripts were employed at the prevailing wages in the industries to which they were assigned.

The Government's labor conscription policy was adopted soon after the fatal clash between troops and striking miners of the Patiño tin mines at Catavi in December, 1942 (see 1943 YEAR BOOK). This clash precipitated both an international incident and an internal political issue that rocked the Peñaranda Government throughout 1943. It moved Ernesto Galarza, Mexican-born official of the Pan American Union, to accuse the U.S. Ambassador to Mexico, Pierre Boal, with bringing pressure upon the Bolivian Government to prevent application of a new labor code designed to improve the miners' wages and working conditions. Under-Secretary of State Sumner Welles flatly denied the charge. He said Boal had merely inquired as to the effect of the labor code upon the cost of tin and other Bolivian minerals purchased by U.S. war agencies. Welles pointed out that the labor code had been promulgated by the Bolivian Government on Dec. 8, 1942, some days before the clash at the Catavi mines.

Inquiry into Labor Conditions. These developments exposed the Peñaranda Government to the charge that it was serving as the tool of "Yankee imperialism" in exploiting Bolivian labor. The Government answered this propaganda by establishing on January 23 a committee of labor experts to "study the improvement of the conditions of health, hygiene, salaries, and security of workers in general and particularly of mine workers." The U.S. Government, as purchaser of the bulk of Bolivia's mineral output, was invited to participate in the inquiry. The State Department appointed five American labor experts, headed by Judge Calvert Magruder of the U.S. Circuit Court in Boston, to join Bolivian experts in conducting the investigation.

The American mission arrived in La Paz February 2 and went on tour of Bolivia's principal mining districts and of the agricultural and rubber-producing regions of the east and northeast. At the Catavi mines it obtained the promise of labor leaders that no disturbances would occur to hamper the output of tin ore. At the same time representatives of the Patiño interests and the government agreed to cooperate in improving conditions

of the workers.

The report of the joint U.S.-Bolivian commission, as submitted to the Bolivian Government on March 14, was made public by the State Department in Washington April 20. It found low wages the rule rather than the exception (tin miners received the equivalent of 10 cents a day for 12 hours work), widespread insufficiency of medical, dental, hospital and nursing care, frequent lack of safety appliances, promiscuous use of child labor, "total absence of free association and collective bargaining," and inadequate educational facilities.

Recommendations of the commission included: Higher standards and pay for teachers, appointment of a group of U.S. educators to Bolivian normal school faculties for a period of years, elimination of restrictions on free association, lifting of the ban on labor meetings unless attended by labor inspectors, establishment of collective bargaining by the mining companies and a minimum wage system, and improvement of workers' sanitation, housing, and health conditions. For a good description of Bolivian economic conditions and labor problems, see the following article by a member of the U.S. mission: Robert J. Watt, "Bolivian Puzzle," The Inter-American, July, 1943, p. 17f. Labor Reforms. The Bolivian Government indi-

Labor Reforms. The Bolivian Government indicated its desire to carry out the recommendations of the commission so far as possible. A bill for the establishment of a social security system was drafted for submission to Congress. Studies were initiated looking toward the creation of a system of inspection and supervision over working conditions. Two hospitals and a number of dispensaries were constructed in the rubber-producing regions.

were constructed in the rubber-producing regions.

U.S. Economic Aid. While cooperating with the foregoing short-term program for stimulation of mineral production, the U.S. Government extended its contribution to the long-term program for economic development initiated in 1941 and 1942 (see

preceding Year Books). In brief this program called for the development of Bolivia's resources through a development corporation jointly financed by the Bolivian Government and the U.S. Export-

Import Bank.

The Bolivian Development Corporation got under way Dec. 29, 1942, with the signing in Washington of a tripartite contract by the Bolivian Government, the Development Corporation, and the Export-Import Bank. Under the contract the Government contributed \$10,500,000 toward the capital of the Corporation and guaranteed a credit of \$15,500,000 extended to the Corporation by the Export-Import Bank. This gave the Corporation a capital of \$26,000,000 to increase farm production in the eastern mountain valleys and lowlands and to build transportation links between these farming and ranching districts and the mining cities of the high Bolivian plateau, which were dependent upon high-priced food imports from abroad. The board of directors of the Corporation was composed of three appointees of the Bolivian Government and three appointees of the Export-Import Bank. Rowland Egger, an experienced U.S. business man, was named manager and Carlos Guachalla, former assistant manager of the Banco Central of Bolivia, president of the board of directors.

Of the Corporation's capital, \$12,000,000 was allocated for the construction of highways, including some \$8,000,000 for a modern road connecting Cochabamba on the plateau with Santa Cruz in the eastern lowlands. Work on this important highway was begun during 1943 with machinery imported from the United States (see above under Transportation). Another \$5,500,000 was allocated for the development of the oil industry in eastern Bolivia. Four millions were to be devoted to the development of the sugar industry, \$1,000,000 to mining, and lesser amounts for the promotion of

rice growing, cattle raising, etc.

Vice President Wallace witnessed the signing in La Paz on April 6 of a U.S.-Bolivian agreement for the establishment by the Bolivian Development

Corporation of six experimental stations to encourage farm production and cattle breeding. The agreement called for the expenditure of \$150,000 annually on the project, with the U.S. and Bolivian governments and the Corporation contributing equally. Later in the year the Corporation arranged to lend \$500,000 to the Banco Agricola to encourage rice and wheat production, the importation of improved strains of cattle, and the establishment

of sugar refineries.

In response to the invitation extended in 1942, President Peñaranda in May made an official visit to the United States, accompanied by military and economic advisers. After conversations held in Washington, he and President Roosevelt on May 14 issued a joint statement saying they had considered war and postwar problems affecting the long-term economic interests of the two countries. They announced that officials of the two governments were studying ways of intensifying cooperation and insuring a continuing exchange of products and raw materials on a stable and durable basis. Peñaranda addressed both the U.S. Senate and House of Representatives. Besides the United States and Canada, he visited 11 other American republics during a nine-weeks' tour. Upon his return home July 5, he was greeted by more than 50,000 residents of La Paz.

Drive for Ports. Bolivia's declaration of war against the Axis was accompanied by the renewal of the recurrent diplomatic and press campaign for the restoration of one of the Pacific ports lost to Chile in 1883. President Peñaranda reaffirmed Bolivia's aspirations for an outlet on the Pacific in a speech at Mexico City while on his tour. The Bolivian demand was once again firmly rejected by the Chilean Government, which granted Bolivia free port privileges at Arica in 1929.

On the way home from Washington Peñaranda stopped in Rio de Janeiro for important conferences with President Vargas. There he obtained important concessions from Brazil, including a trade pact, free port privileges at Santos, and a tentative agreement to exchange unspecified Bolivian frontier territory for an undeveloped Brazilian port on the Paraguay River. In the trade pact Brazil agreed to provide financial aid and materials to complete the Santa Cruz-Corumbá railway in return for Bolivian oil and other export products.

The free port concession at Santos was of great potential importance for the development of the eastern Bolivian lowlands, which would have direct railway communications with that Atlantic port once the Corumbá-Santa Cruz line was completed. This was scheduled for late in 1944.

Following his return to La Paz Peñaranda renewed his demand for a Pacific port and sought to enlist Argentine aid. The Argentine Foreign Office, however, was reported to have sided with Chile. Bolivia was dissuaded from formally raising an issue likely to disturb the peace of South

America.

Economic Conditions. The mining industry enjoyed an extraordinary boom in 1943 as a result of the heavy U.S. and British demand for tin and other strategic minerals. There were minor booms in rubber and cinchona bark. Export taxes levied on these products boosted Government revenues to the highest levels ever recorded and enabled it not only to balance the budget but to reduce its debt to the Banco Central while providing capital for the Bolivian Development Corporation. The boliviano was strengthened by the accumulation of dollar and sterling exchange. However no move to renew payments on Bolivia's defaulted foreign

debt was made by the end of the year.

The encouraging picture offered by the mining boom and the Government's improved financial position was offset by the continuance of extreme price inflation, which provoked mounting unrest among low-income groups of the population. In some cases rents had risen 500 per cent in three years. Government efforts at price control proved of little avail for lack of adequate enforcement machinery. A United States "decentralization plan" of export control, which went into effect on Apr. 1, 1943, restricted the importation of U.S. goods into

Bolivia to actual needs.

Internal Politics. The Government was under persistent attack during the year from the Leftist and pro-Nazi groups in Congress on the one hand and from the powerful mining companies on the other. The Leftists attacked the conservative government coalition for its social and economic policies, which they declared were ruining the country, and particularly for the disturbances at the Catavi mines. The mine owners objected strenuously to the heavy

export taxes on minerals.

President Peñaranda adopted a conciliatory attitude toward both groups of opponents. While in New York he invited his former rival for the Presidency, Dr. José Antonio Arze, chairman of the Left Revolutionary party, to confer with him. According to a report of the interview made public by Dr. Arze on May 22, Peñaranda stated that several Leftist leaders exiled after the Catavi strike

had been permitted to return home, that he would grant "the fullest guarantees to labor unions, that the labor code would be resubmitted to Congress to revise some aspects of it objectionable to the workers. The President also authorized Arze's Left Revolutionary party to hold its second annual convention in 1943, but warned it against inviting the participation of foreigners in Bolivian politics.

Upon the reconvening of Congress in August, the Left Revolutionaries joined with the National Revolutionary party in an attack upon the Government that forced the resignation of the entire Cabinet on August 27. A bitter debate on responsibility for the Catavi incident continued until September 15, when a vote revealed 48 Deputies supporting the Government and 47 in favor of censure. On September 17 the President appointed a new Cabinet representing a coalition of the four "traditional" parties—Republican, Genuine Republican, Republican Socialist, and Unified Socialist. It was anticipated that if these four parties could remain united against the opposition they could win the Presidential and Congressional elections scheduled for May, 1944, without difficulty.
The state of siege decreed on Dec. 14, I

continued in effect, but the press censorship imposed under the decree was lifted on February 3. On May 18 a general censorship of the press and of all forms of communication was again imposed. The press censorship was lifted on July 27.

Government Overthrown. Before dawn on December 20 politicians and young army officers of nationalist leanings overthrew the Government by a military revolt in La Paz. The coup was led by Victor Paz Estenssoro, former Cabinet Minister and chief of the National Revolutionary party, who had strongly opposed Peñaranda's close collaboration with the United States. Paz Estenssoro had been arrested in 1941 in connection with the abortive pro-Nazi coup of that year (see 1942 YEAR BOOK), and shortly before the 1943 revolt had conferred with Argentine nationalists and Germans in Buenos Aires. The platform of his National Revolutionary party was anti-United States, anti-Communist, and hostile to foreign capital. His chief aide was Major Alberto Taborga, head of the Bolivian traffic police. The revolt was carried out by Taborga's well-armed police, assisted by army officers and a group of armed civilians believed to be members of the National Revolutionary party. They surprised and overwhelmed the Government officials and the higher army officers and then over-came the La Paz regular army garrison in street fighting which lasted for four hours. One person was killed and 34 wounded.

By 7 a.m. the revolutionaries were in full control. Two hours later they broadcast an announcement of President Peñaranda's resignation. He was allowed to leave the country. Upon his arrival in Arica, Chile, two days later, Peñaranda denied that he had resigned. Meanwhile a revolutionary junta had assumed control of the Government at noon on December 20. The members were: President, Major Gualberto Villarroel, a veteran of the Chaco War; Foreign Minister, José Tamayo; Finance, Victor Paz Estenssoro; Defense, Major Ceruster Control of the Chaco War; Foreign Minister, José Tamayo; Finance, Victor Paz Estenssoro; Defense, Major Cerus Carlos Control of the Chaco War; Foreign Minister, José Tamayo; Finance, Victor Paz Estenssoro; Defense, Major Cerus Carlos Ca lestino Pinto; Government, Major Alberto Taborga; Public Works, Major Antonio Ponce; Education, Major Jorge Calero; Agriculture, Carlos Monte-negro; Economy, Gustavo Chacón; Labor, Victor

Andrade; Secretary-General, Augusto Céspedes. The leaders of the junta took immediate steps to calm apprehension among the other American republics by declaring their support of the United

Nations' cause and professing pro-democratic sentiments. They asserted the revolt was motivated entirely by the Peñaranda Government's alleged corruption and repression of the masses and announced their intention of restoring constitutional government. On December 24 the Nationalist Revolutionary Government decreed that the 1938 Constitution should remain in force with minor changes, that Bolivia's commitments to the United Nations should be adhered to in their entirety, and that a plebiscite should be held "at the first opportunity."

Recalling that similar assurances had been given by the leaders of the Argentine military revolt the previous June, only to be repudiated after recognition had been obtained, 19 of the American republics withheld recognition of the new Bolivian regime for closer scrutiny and mutual consultation. Argentina granted recognition the end of December. In an apparent effort to dispel these suspicions of its objectives, the La Paz Government on December 30 instructed its Washington representative to initiate negotiations for recognition of the Soviet Union.

BOMBS. The bazooka rocket gun made its debut against enemy tanks in the North African campaign in the summer of 1943. The bazooka launcher is a metal tube open at both ends, more than 50 inches long and less than 3 inches in diameter. It is operated by two men; the loader who inserts the rocket, and the firer who squeezes the trigger. This electrically ignites the propellant which flashes from the rear of the launcher tube and sends the rocket on its sinister journey. The rocket itself is about 2 feet long with high explosive in the head, a propelling charge in its tubular body, and a finned tail to provide accuracy in flight.

and a finned tail to provide accuracy in flight.

The rocket is the terrible new weapon of this war. Rocket machines presumably first appeared in Russian Stormovik planes strafing Nazi tanks; subsequently they were used by the Germans against American heavy bombers in an attempt to demoralize Fortresses or Liberators flying in close formation without exposing the German fighters to their heavy fire. The Soviet anti-tank rockets were fired by contact fuzes like ordinary naval shells; the German anti-bomber rockets are fired by devices like the flak sent up by anti-aircraft guns. In both, the theory is to impart additional thrust forcing the rocket to pierce through thick armor plate. Unlike a shell which has its maximum velocity at the instant it issues from the muzzle of the gun, the rocket attains its maximum velocity at the moment of impact.

The British counterpart of the bazooka is the PIAT (Projector, Infantry Anti-Tank). This weapon projects a 2¾-lb. bomb, filled with high explosives, which explode on impact with the target. The propellent force is derived from the explosion

of a cartridge in the tail.

Several types of incendiary bombs are described and diagramed in the Office of Civilian Defense publication 2016 issued in March, 1943. One-kilogram and two-kilogram magnesium incendiaries with or without high explosives, and six types of containers for holding 36 to 700 of them, are included. German phosphorus bombs are described:

one weighs 90 pounds and contains 30 pounds of a viscous solution of phosphorus, oil, benzene, and rubber. On impact the bomb is split open, and the liquid, scattered some yards, simultaneously ignites. The phosphorus can be extinguished with water, but care must be exercised lest the material be washed into some inaccessible spot where it can later re-ignite. Japanese incendiaries described in the publication include: a one-kilogram incendiary with a lethal range of 50 feet, filled with picric acid burster charge and with a main filler of phosphorus; a 50-kilogram bomb containing black powder burster charge and three magnesium alloy-thermit inserts; a 60-kilogram incendiary high-explosive bomb filled with approximately 475 rubber pellets impregnated with phosphorus dissolved in carbon disulphide, which scatter for 50 yards; and a 60-kilogram bomb filled with paraffin wax and kerosene in six steel compartments—upon landing thermit melts and ignites the oil, which is scattered.

Flame throwers have been revived in this war by the Russians in Finland, by the Germans in Belgium, and by Americans in the Pacific. Essentially a blow-torch in theory, it produces terrific heat, consumes oxygen in any confined space such as a foxhole, and produces deadly carbon monoxide.

Other new devices include fragmentation bombs dropped in parachutes to delay the explosion, so that low-flying bombers can get out of range; radioguided rocket gliders; a torpedo carrying two auxiliary torpedoes attached to it; and a steadier-flying bomb with the propellant in a detachable tail, which falls off when the bomb is clear of the bore.

Colored smokes have been developed so that ground forces can identify themselves to planes overhead. One form, packed as a hand grenade, emits red, orange, yellow, green, violet, black, or white smoke, and may be used on water as well as on land. Special patterns laid on the ground can signal in code between tanks and airplanes. For laying smoke screens, the Germans are using a six-barreled fog thrower, the "nebelwerfer," a weapon that launches ordinary field-gun caliber projectiles.

The Chemical Warfare Service issued in December, 1943, new symbols for the more important war gases. These include Lewisite (L), mustard (M), mustard-Lewisite mixture (HL), brombenzyl cyanide (BBC), phenyl dichloride (PD), Arsine (SA), cyanogen chloride (CC), hydrogen cyanide (OC), and nitrogen mustard (HN).

BOWLING. Bowling continued to gain in popularity in 1943 despite cancellation of the American Bowling Congress tournament and the women's national championships, the sport's biggest events. Industrial, club, church, and "good neighbor" leagues kept thousands of alleys humming and many service men became devotees of the game with the in-

troduction of kegling to camp recreation halls.

The individual, two-man, and five-man matchgame contests were the only tourneys of national scope. Ned Day of Allis, Wis., whose four-year reign as singles king had been interrupted by Connie Schwoegler of Madison, Wis., last winter, won the title for the fifth time in December of 1943. Voted the bowler of the year by writers, Day toppled 13,371 pins, won 47 games and lost 18 in winning the title. Nelson Burton and Frank Mataya, St. Louis stars, won the doubles, and the Detroit Strohs retained team honors. The Strohs defeated the A.B.C. champion Chicago Budweisers by 461 pins in an eight-block \$1,000 challenge match.

Miss Laura Stellmacher, Chicago match-play queen, turned in the best series for a woman

bowler when she rolled 718 in a mixed doubles contest, marking up games of 287 (only 13 pins short of a perfect score), 197, and 234.

The Bowlers Victory Legion made a distinct contribution to the war effort in 1942–43, raising \$300,000 for the Red Cross and \$90,000 for the U.S.O. in addition to selling more than \$1,000,000 worth of bonds through the medium of local

tournaments.

Buffalo will be the site of the A.B.C.'s first post-Buffalo will be the site of the A.B.C.'s first postwar tourney and till then the champions remain: John Stanley, Cleveland, individual; Ed Nowicki and George Baier, Milwaukee, doubles; Chicago Budweisers, team, and Tod Moskal of Saginaw, Mich., all-events. Women's national titleholders for the duration are: Tillie Taylor, Newark, N.J., singles, Stella Hartrick and Clara Allen, Detroit, doubles, Chicago's Logan Square Buicks, team, and Nina Van Camp, Chicago, all-events.

THOMAS V. HANEY.

BOXING. With more than 4,000 professional boxers, including five champions, serving in the armed forces, it was only fitting that the Boxing Writers Association name all our pugilists now fighting for Uncle Sam as 1943 winners of the Eddie Neil Memorial Trophy, a prize awarded annually to the "boxer of the year."

Joe Louis, heavyweight; Gus Lesnevich, light heavyweight; Tony Zale, middleweight, and Red Cochrane, welterweight, were in the service all year and Willie Pep joined up after a successful defense of his featherweight crown. With such champions as these missing and most of the titles "frozen" for the duration, boxing faced some rough going at the start of the year, but managed to keep moving, with the result that the sport enjoyed a rather good year. For a while the prospects of a return meeting between Sergeant Joe Louis and Corporal Billy Conn for the heavyweight title appeared bright, but the War Department stepped in and firmly refused to permit the match. Louis carried on in an extensive tour of Army camps, giving exhibitions, and Conn confined his activities to Army duties

After Pep joined the Navy there was champion-ship activity in only two divisions—lightweight and bantamweight—and it was a case of "Little man what now?" for Mike Jacobs and other promoters who managed to escape near disaster by the skillful matching and rematching of the little

fellows.

Beau Jack, the one time bootblack in a Georgia golf club, who soared to the top of the light-weight ranks in 1942, lost and regained his title

in 1943. The Beau, recognized as 135-pound ruler by New York and New Jersey as the year opened, lost to Bob Montgomery of Philadelphia in May, whereupon Pennsylvania promptly granted recognition to his conqueror. Then in November, Jack outpointed his Negro rival to regain the championship. Jack proved the greatest gate attraction of the season, his six bouts at Madison Square Garden grossing \$485,515. The year's biggest ring crowd, 19,986 persons, paid \$104,976 to see the Beau outpoint Henry Armstrong in a nontitle fight at the Garden in April.

Manual Ortiz, little Mexican who wears the world bantamweight crown, proved the "fighting-est" champion of them all, defending his title no fewer than eight times, which set a new modern record for a champion. Ortiz defeated Kenny Lindsay, former champion Lou Salica, Lupe Cordoza, Joe Roberts (twice), Fileo Gonzalez, Leonardo Lopez, and Benny Goldberg.

Pep, who had compiled a record of sixty-two straight triumphs, finally met defeat in March when Sammy Angott, coming out of the retirement which had caused him to surrender his world lightweight laurels in 1942, outboxed the Hartford fighter in an over-the-weight bout. Three months later Pep successfully defended his featherweight championship against Sal Bartolo in Boston, and shortly after that entered the Navy

Meanwhile the National Boxing Association, withholding championship recognition from Pep, sanctioned a featherweight match between Jackie Wilson and Jackie Collura, and the latter won. Two months later Collura again beat Wilson, but in August Phil Terranova defeated Collura to gain

recognition as the N.B.A. champion.

Beau Jack's lightweight crown also is very much in dispute, New York State recognizing the Beau as king of his class while the N.B.A. still regards

Angott as its champion.

Ray Robinson, top welterweight, after winning 41 bouts in a row, was outpointed by Jack La Motta in one of the year's biggest surprises, but Robinson reversed this setback before going into the Army. Other major upsets were Lee Savold's heavyweight defeat by Eddie Blunt, a rival he later knocked out in one round, and Bobby Ruffin's clear-cut triumph over Beau Jack shortly before the Beau regained the disputed lightweight honors.

The University of Wisconsin dominated the National Collegiate A.A. championships, its boxers capturing titles in five of the eight classes contested, while Syracuse carried off the Eastern Intercollegiate team laurels, the upstate New Yorkers winning in six of the eight divisions. Walter Moore of Chicago annexed honors in the most important national A.A.U. class, the heavyweight group. See Radio Programs.

Populations admixtures of Negro and Indian Blood, Populations of the chief cities: Rio de Janeiro, 1,801,784; São Paulo, 1,500,000; Recife (Pernambuco), 348,472; Salvador (Baía), 291,500; Pôrto Alegre, 275,739; Belo Horizonte, 211,650; Belém (Pará), 208,706; Fortaleza, 174,855; Niterói (Nictheroy), 143,004; Curitiba (Curityba), 142,185; Santos, 140,000; Manaus, 107,456. Portuguese is the official and principal language but Italian and German are principal language, but Italian and German are

widely used in the southern States. Defense. Military training is compulsory for all males from 21 to 45 years of age, the first year in the ranks and the rest in the reserve. Brazil entered World War II on Aug. 22, 1942, with an active army of more than 100,000 and with some 291,000 trained reserves, including 32,500 State troops. The independent air force had about 3,500 officers and men and 150 planes. The navy consisted of 2 battleships and 2 cruisers, all laid down in 1907 but extensively refitted, 1 destroyer, 6 torpedo boats, 4 submarines, 6 minelayers, and various auxiliary craft. Reserves of all armed forces were mobilized by the decree of Sept. 16, 1942. Six months later it was reported that the military forces had been tripled, and that air and naval forces were likewise rapidly expanding, with the aid of equipment supplied by the United States. Six destroyers and nine mine-sweepers constructed in Brazilian yards were reportedly added to the fleet

in 1943. U.S. military, naval, and air missions advise the Brazilian forces. Under the lend-lease agreement of Oct. 1, 1941, the U.S. Government agreed to furnish arms and other military equipment valued at \$90,000,000 to \$110,000,000. Another agreement signed Mar. 3, 1942, provided for expanded lend-lease aid. After Brazil entered the war, American and Brazilian naval and air forces patrolled Brazil's coastal waters from Brazilian bases. U.S. funds and technicians helped to complete during 1943 a chain of important new air bases at Natal, Recife, Belém, and other strategic points. In March Parnamarin Field at Natal was reported in full-scale operation, handling a volume of traffic to and from Africa that made it one of the world's largest transoceanic airports. See also *History* below.

Education. According to government figures, illiteracy dropped from an estimated 65 per cent to less than 50 per cent in the last ten years. Of an estimated 4,500,000 children of school age, about 2,700,000 were in primary schools in 1937. In 1940 there were 39,650 primary schools, with 3,109,784 pupils; 718 secondary schools, with 143,289 pupils; 564 commercial schools, with 40,537 pupils; 153 industrial schools, with 14,540 pupils; 213 degree-conferring institutions, with 22,300 students. There is a national university in Rio de Janeiro and three private universities in Porto Alegre, Belo Horizonte and Curitiba. Roman Catholicism is the predominant religion.

Production. About 75 per cent of the working population is engaged in agriculture and stockraising, 15 per cent in industry, and 10 per cent in trade, transport, etc. All goods produced in 1939 were valued at 27 billion milreis, of which industry accounted for about 12.5 billions (13.6 in 1940), agriculture 9, livestock 3, and minerals 1 billion. Brazil is the world's largest producer of coffee and normally ranks second in cacao, third in sugar and tobacco, and fourth in cotton. Coffee production was 20,850,000 bags (of 132 lb.) in 1940–41,

12,787,000 bags in 1941-42, and an estimated 14,-000,000 bags in 1942-43. Between 1931 and Mar. 15, 1943, a total of 77,481,988 bags of coffee were destroyed in connection with the Government's price-maintenance program. Yields of other leading rops were: Lint cotton, 399,866 metric tons in 1941–42; cocoa beans, 1,808,035 bags (of 132 lb.) in 1942–43; cane sugar, 1,191,900 metric tons in 1940–41; maté, 186,231,000 lb. in 1941. Rubber output was less than 40,000 metric tons in 1943 and was expected to reach about 50,000 tons in 1944.

The approximate production of other crops was (in metric tons): Tobacco, 86,600; rice, 1,401,000; raw silk, 700; wheat, 150,000; corn, 6,000,000; potatoes, 334,000; beans, 798,000. Oranges, bananas, pineapples, grapes, and numerous other fruit are grown in quantity. Average yields of the chief forest products (in metric tons): Balata, 1,250; babassu nuts, 39,267 (exports in 1941); vegetable oils, 124,483 (1940); oil seeds, 117,495 (1940 exports); carnauba wax, 11,766 (1941 exports). Livestock in 1941 included 41,872,874 cattle, 23,521,666 swine, 5,850,801 goats, 6,709,310 horses, and 4,118,073 asses and mules. Meat production was 720,000 metric tons in 1941.

Mineral and metallurgical production in 1941 was (metric tons): Steel ingots and castings, 154,-189; rolled steel products, 149,928; pig iron, 208,-795; coal, 1,040,000; manganese ore (exports), 437,402; iron ore (metal content), 480,000 in 1940; salt, about 1,700,000 annually. A newly discovered oil field was under development in the State of Bahia. Output of the Itabira iron ore mines in 1943 was thrice that of 1942 as a result of the development program undertaken with U.S. aid (see 1943) YEAR BOOK, p. 88). Gold output (1941), 4,581,811 grams; diamonds, about 20,000 carats. The leading manufacturing industries are cotton weaving, sugar refining, flour milling, meat packing and the fabrication of machinery, paper, textile products, to-bacco products. There were, in 1941, 825,425 in-dustrial workers and 75,834 industrial establishments powered from 1,200 electric plants with a capacity of more than 1,100,000 kw. Also see History below.

Foreign Trade. Imports in 1942 totaled 4,644,000,-000 cruzeiros (5,514,000,000 in 1941); exports, 7,495,000,000 (6,725,000,000 in 1941). The favorable trade balance rose from 1,211,000,000 cruzeiros in 1941 to 2,851,000,000 in 1942. This trend was due primarily to higher export prices. The average per-ton price of exports in 1942 was 2,818 cruzeiros (1,902 in 1941); of imports, 1,547

cruzeiros (1,361 in 1941).

Raw materials accounted for 40.6 per cent of the total export values in 1942 (48.3 in 1941); food-stuffs, 44.2 per cent (46.2 in 1941); manufactures, 14.9 per cent (5.5 in 1941). Coffee exports accounted for 40 per cent of the total export value in 1939, 30 per cent in 1941, and 16 per cent in 1942. Of the 1942 imports, the United States supplied 54 per cent by value (60.8 in 1941); Argentina, 17 (11.8); United Kingdom, 6 (5.7). Of Brazil's 1942 exports, the United States took about 46 per cent (56.9 in 1941); United Kingdom, 16 (12.2). Argentina, 13 (2.2)

(12.2); Argentina, 13 (9.2).
Finance. Ordinary budget estimates of the national government for 1943 were: Receipts, 4,777,675,000 cruzeiros; expenditures, 5,270,160,789. In the extraordinary budget, receipts and expenditures balanced at 600,000,000 cruzeiros. The year 1942 closed with an actual deficit of 1,182,100,000 cruzeiros in the ordinary budget (revenues, 4,565,-900,000; expenditures, 5,748,000,000). Extraordinary revenues totaled 611,100,000 cruzeiros and expenditures 595,200,000.

The external bonded debt of the Federal, State, and municipal governments outstanding Dec. 31, 1942, was equivalent to about \$935,600,000 par value, distributed as follows (in millions): Dollar debt, \$305; sterling debt, £147.1; French debt, 520.3 paper and 229.2 gold francs; Dutch debt, 6.4 florins. On Nov. 1, 1942, the milreis was replaced as the unit of currency by the cruzeiro, equal in solve to the milreis was represented in value to the milreis. Average exchange rates of the cruzeiro: Official rate, \$0.06058 in 1941 and 1942; free rate, \$0.05071 in 1941 and \$0.05143 in 1942.

Transportation. In 1943 there were about 21,242 miles of railway lines, over 129,100 miles of highways, 40,000 miles of navigable inland waterways, and an extensive network of air lines. With the nationalization of the former German-controlled air lines and discontinuance in 1942 of the Italian (LATI) transatlantic service, Pan American Airways remained the only international system or erating in Brazil. The Brazilian army operates 9,000 route-miles of air lines to isolated points in the interior. Total air traffic statistics for 1941: Passengers, 99,662; baggage, 1,612 tons; express, tons; mail, 233 tons. In 1941, 3,780 ships of 6,286,-838 tons entered the port of Rio de Janeiro and 3,705 ships of 5,251,299 tons entered at Santos.

Government. The Constitution of Nov. 10, 1937, provided for the reorganization of Brazil along the lines of a corporative state (see YEAR BOOK, 1937, p. 102). However the Parliament and other governing institutions provided for in the Constitution were not established. President Getulio Dornelles Vargas continued to rule as a personal dictator, having dissolved all political parties. He became provisional President Nov. 3, 1930, after leading a successful military revolt. Under the Constitution of July 16, 1934, he was elected constitutional President the following day for a four-year term. The 1937 Constitution extended his term for six years from 1938. Subsequently his tenure of office was further extended pending a plebiscite, the date for which had not been announced up to the end of 1943. Members of the Cabinet at the beginning of 1943 were: Foreign Affairs, Oswaldo Aranha; Finance, A. de Souza Costa; War, Gen. Eurico G. Dutra; Marine, Adm. Henrique A. Guilhem; Transportation and Public Works, Gen. João de Mendonça Lima; Labor, Industry and Commerce, and Acting Minister of Interior and Justice, Dr. Alexandre Marcondes Filho; Agriculture, Dr. Apolonio Salles; Education and Public Health, Dr. Gustavo Capanema; Aeronautics, Dr. Joaquim Pedro Sal-gado Filho. In September, 1942, João Alberto Lins Barros was appointed to the important new post of Coordinator of National Economy. For 1943 developments, see below.

# HISTORY

Brazil at War. "Brazil's position is one of determination that nothing is too trifling or too great to give to attain victory," said President Vargas on the first anniversary of Brazil's entrance into the war. This attitude was reflected throughout 1943 in the vigor with which Brazil pressed forward with the mobilization of its military and economic resources in support of the United Nations.

Military Preparations. With the aid of substantial shipments of modern weapons and equipment supplied by the United States under lend-lease agreements, Brazil made rapid progress in the creation of a relatively small but up-to-date army, navy, and air force (see above under Defense). On January 9 military conscription was widened to include youths of 18 years of age and all naturalized citizens. The Brazilian navy and air force, joining forces with U.S. units based in Brazil, waged effective warfare against Axis submarines. In the year ended Aug. 22, 1943, Brazilian air units alone destroyed 13 subs to compensate for 124,000 tons of Brazilian shipping sunk by enemy action. Meanwhile War Minister Eurico Gaspar Dutra on July 1 began recruiting volunteers from 21 to 26 years of age for overseas service. Arrangements for the final training and shipment overseas of a volun-teer force of at least two divisions were pushed forward with United States aid. An advance reconnaissance party of this expeditionary force arrived in Algiers in mid-December and began final

battle training with French troops.

Roundup of Spies. The Government continued its efforts to root out Axis spies, saboteurs, and propagandists as well as to eliminate the activities of native fifth columnists. On February 10 it announced that a Nazi conspiracy to train Brazilian soldiers of German descent to assist an Axis invasion had been broken up four months before; Rio Grande do Sul authorities arrested about 130 army officers, soldiers, and civilians, including three Lutheran ministers. Santos police on February 20 accused the son of the former German consul there of plotting to sink British ships calling at the port by means of delayed-action bombs. A radio message intercepted by U.S. authorities led to the arrest and trial of Capt. Tulio Regis do Nascimento of the Brazilian Coast Artillery as alleged head of German espionage activities in Brazil. The prisoner had been scheduled to visit the United States with other Brazilian officers.

Trials of numerous other Axis spies and suspected conspirators continued before both military and civil courts during the year. Dr. Cauby de Araujo, president of Panair do Brazil, a subsidiary of Pan American Airways, was absolved on March 5 of the treason charges lodged against him in 1942. Four other defendants accused with him of conspiring to obtain Brazilian military secrets were each sentenced to 20 years imprisonment by the military court. One director and one reporter of the German Transocean news agency, which distributed German propaganda throughout Brazil prior to the republic's entrance into the war, were convicted of sedition and each sentenced to seven

years' imprisonment on November 28. On August 18 the police announced the breaking up of another large Axis spy ring, including both Germans and Japanese. Its leader, a German named Niels Christensen, was sentenced to 30 years' imprisonment by the National Security Tribunal October 7. Thirteen other members of the ring received sentences of 25 years or less. They were linked with a secret broadcasting station that transmitted data on ship departures and routes. It was revealed that the British liner Queen Mary narrowly escaped being sunk in the autumn of 1942 as a result of information supplied by the ring. Two other German leaders of an espionage organization with branches in the United States were sentenced to eight years at hard labor on August 30.

The presence of members of the Fascist Integralista movement among Axis espionage organizations led the Government to give semi-official support to the observance of Anti-Fascist Week the second week in May. Various anti-Fascist ceremonies were held to commemorate President Vargas's escape from assassination by Integralistas on May 11, 1938 (see 1938 YEAR BOOK). On July 8 the police ordered all German and Japanese nationals and suspected Italians removed from the coast of São Paulo to the interior.

Early in October President Vargas decreed the liquidation of 34 German firms which were shown to have been controlled by the German Government through members of the Gestapo posing as employees. Two weeks later 45 additional Axis properties were ordered liquidated, including 25 Japanese properties. Among the latter was the Nippon Colonization Corporation, which Brazilians claimed was controlled by the Japanese Government and used to cloak Japanese plans and movements in the Amazon Valley. The Germans continued to hold the personnel of the Brazilian Embassy at Vichy, seeking to exchange them for German nationals convicted or accused of anti-brazilian activities. However Brazil reportedly declined to release any Germans in this category. On November 24 the Government seized the Banco Hipotecario Agricola, capitalized at \$1,000,000, which the press charged was German-controlled

Economic Mobilization. Brazil's most valuable contribution to the United Nations war effort was in increasing the output of strategic materials for the war industries of the United States and Britain. Among these materials were rubber, bauxite, manganese, bismuth, beryllium, tin, iron, quartz, vegetable oils, hides, fibers, industrial diamonds, etc. The United States aided the expansion of production in these lines by technical and financial assistance, provided for by the series of economic accords concluded in 1941, 1942, and 1943 (see preceding Year Books and below under U.S.-Brazilian Collaboration.

The entire economic mobilization program was directed by the Brazilian Coordinator of the National Economy. At his suggestion, President Vargas on April 17 issued a decree forbidding industrial workers to leave their jobs. Another decree of September 17 banned collective bargaining for the duration of the war and forbade workers to retard production in any way. The Coordinator also waged war upon hoarders and speculators in scarce commodities, whose activities contributed to the strong inflationary movement. On March 2 he established ceiling prices on all commodities at the Dec. 1, 1942, level. Finding it impractical to control prices without adequate enforcement machinery, the Coordinator in August decided to rely exclusively upon the expansion of production and better distribution to counteract inflation. The railways were required to give priority to the distribution of essential commodities.

Twenty-two basic raw materials were placed under strict Government control in May to balk hoarders and profiteers. Imports were restricted to essential supplies. Cocoa production and export was nationalized May 22. Rationing of sugar, butter, and bread was introduced. Agreements were made with the textile mills and other producers of staples to provide for the needs of the poorer classes at low prices. As the shipping situation improved, there were increasing arrivals of essential supplies from abroad. Yet the rise in prices continued unabated, spurred on by an unprecedented boom in the construction of housing and industrial plants. Higher taxes on incomes, dividends, and excess profits were provided for in the 1944 tax bill signed by President Vargas on September 24.

bill signed by President Vargas on September 24.
A favorable result of the economic boom was the marked increase in Brazil's gold and exchange reserves and improvement in its budgetary position. It was revealed in June that Brazilian pur-

chases of U.S. gold under the Stabilization Agreement of 1942 had exceeded the \$100,000,000 limit. Consequently the U.S. and Brazilian Treasuries agreed upon a new ceiling of \$200,000,000. Brazil's improved financial status enabled the Government to begin negotiations for increased payments on its external debt. The existing 1940 debt-payment accord was due to expire Mar. 31, 1944. On November 25 the Government undertook to service outstanding dollar and sterling bonds at rates reducing the original charges from about \$100,000,000 to about \$30,000,000 annually. The plan called for the repayment of the Brazilian foreign debt in 23 years at a saving of 37 per cent standing loans.

Rubber Campaign. The joint U.S.-Brazilian program for the expansion of rubber production in the Amazon Basin (see 1943 Year Book, p. 89) encountered difficulties in 1943 and the output was well under the scheduled total of 50,000 tons. The shortage of river vessels and planes to transport men and supplies into the rubber regions and to export the rubber delayed Coordinator de Barros' plans for rushing 50,000 rubber gatherers into the interior. However 8,000 men had been transported from drought-stricken regions of northeastern Brazil to the rubber areas by the end of May. The arrival of the needed ships and planes from the United States later in the year overcame most of the original handicaps. Plans called for increasing production of rubber to some 50,000 tons in 1944 and to a maximum of 70,000 tons the following year.

Meanwhile work was rushed on new airports, docks, trails, camps, and health and sanitation projects designed to facilitate the task of the rubber gatherers. In mid-July a Brazilian expedition set out from Leopoldina, State of Goyaz, to survey the virtually unexplored regions of the Río dos Mortes and Rio Xingú for new sources of rubber and to establish a colonization center on the Río dos Mortes. Army engineers were at work on a 1,000-mile highway linking the city of São Paulo with Cuiabá, capital of Mato Grosso.

Paulo with Cuiabá, capital of Mato Grosso.

Under the general direction of Dr. George M. Saunders of the Institute of Inter-American Affairs at Washington, a staff of some 1,500 Brazilian doctors, nurses, and technicians were working on a health and sanitation program designed to overcome malaria and other scourges of the Amazon region. By August, 1943, some 20 dispensary infirmaries were in operation, including hospital launches that regularly visited outlying settle-ments and camps. Five major hospitals and some 50 infirmaries (35 floating) were expected to be in operation at strategic points along the great river system by the end of 1943. A million atabrine tablets were being distributed free of charge each month. In one district, this measure reduced the incidence of malaria from 15 to less than 3 per cent of the population. In districts of the lower Amazon where rubber was being harvested, 500 men were at work on a mosquito-prevention program. Under a new Brazilian-United States sanitation and health agreement signed late in 1943, Brazil undertook to spend \$5,000,000 and the United States \$3,000,000 to improve health conditions in the Amazon and Rio Doce valleys as part of the rubber program.

A Brazilian-American Food Commission, established under the agreement signed Sept. 3, 1942, in Rio de Janeiro, provided machinery, equipment, and expert advice for the expansion of vegetable and meat production in the Amazon basin to sup-

port the growing population. Up to the end of August, 1943, this commission had distributed 760 tractors, 1,300 ant exterminators, 10,500 hoes, and seeds and insecticides. Another U.S.-Brazilian agreement concluded in April, 1943, provided for the establishment of stores to distribute foodstuffs and equipment to rubber workers, who were being exploited by private traders. A predominant share of the cost of the entire rubber development pro-

gram was borne by the United States.

Other U.S.-Brazilian Relations. Returning home by air from the Casablanca Conference, President Roosevelt stopped over at Natal for an important conference with President Vargas on January 28–29. According to a joint statement and a joint declaration issued by the two Presidents they (1) discussed the Casablanca conference and the future safety of the Americas, (2) agreed that the coast of West Africa and Dakar should "never again under any circumstances be allowed to become" an invasion threat to the two Americas, (3) declared their common aim "to make the Atlantic Ocean safe for all," and (4) expressed themselves as "deeply grateful" for the "almost unanimous" help which their neighbor nations were giving "to the great cause of democracy." The latter allusion was a pointed reference to the uncooperative attitude of Argentina An immediate result of the tude of Argentina. An immediate result of the Vargas-Roosevelt meeting was the Brazilian Government's formal adherence on February 6 to the Declaration of the United Nations and to the Atlantic Charter.

New U.S. Credits. Warren Lee Pierson, head of the Export-Import Bank, announced on March 15 that the Bank's total credits to Brazil amounted to \$150,000,000. Three days later he signed two agreements in Rio de Janeiro granting (1) an additional credit of \$14,000,000 to the Rio Doce Corporation for the exploitation of the Itabira iron deposits, and (2) an additional credit of \$20,000,-000 to the Brazilian Government for construction of the big Volta Redonda steel plant. Following upon similar accords signed in 1942 (see 1943 YEAR BOOK), these agreements raised the total credits granted the Río Doce Corporation to \$28,-000,000 and the Volta Redonda project to \$45,-000,000. Repayment of the \$14,000,000 Río Doce credit was to be made within 25 years, 15 per cent of Itabira iron ore prices f.o.b. Victoria being segregated for that purpose. A contract for doubletracking and improving the Victoria-Minas Railway tapping the Itabira mines was let to a U.S. construction company on October 9.

Lend-lease materials and services supplied to Brazil were in addition to the Export-Import Bank credits. Besides equipment for the army and air force, a number of submarine chasers were delivered to the Brazilian navy during the year. Beginning in May, 120 Brazilian youths were sent to the United States monthly for air training. As a reciprocal gesture, President Vargas on October 20 delivered 400,000 bags of coffee, valued at more than \$5,000,000, as a gift from the Brazilian peo-

ple to the U.S. armed services. In 1942 the U.S. Commodity Credit Corporation had contracted to buy the entire unshipped surplus of Brazil's 1942-43 quota for coffee sales to the United States. The Commodity Credit Corporation also undertook to buy 1,300,000 bags of Brazil's 1942-43 cocoa crop, the entire exportable surplus of babassu kernels and oil for two years, and 200,000 long tons of castor seed and oil in 1942-43. These agreements, combined with the high prices paid by the U.S. Government for Brazil's strategic materials, were largely responsible for the country's prosperity during the year 1943. On December 21 the U.S. and British Governments contracted to purchase Brazil's exportable rice surpluses for 1944 and 1945. The United States also agreed to buy Brazil's pyrethrum sur-

plus for two years.

Other Foreign Relations. The profitable nature of Brazil's cooperation with the United States and the political interests and natural inclinations of its people made for the closest sort of American-Brazilian collaboration. By a series of diplomatic moves the Vargas Government gave more or less open support to Washington's policies with respect to Argentina, France, Portugal, and Spain. President Vargas received official visits from President Morinigo of Paraguay early in May and President Peñaranda of Bolivia late in June. Extending the Brazilian policy of forging closer economic links with these neighboring states, important new accords were signed with both visitors (see Bolivia and Paraguay under History for details). Free port privileges at Santos were granted both countries. The military and industrial development being made by Brazil, with U.S. aid aroused some misgivings in Argentina (which see). As a result of its war association with the United Nations, the Brazilian Government during 1943 adopted a much more liberal attitude toward Communist Russia, although remaining hostile to Brazilian communism.

Internal Politics. President Vargas's support of the democratic cause in the war was reflected also in the resurgence of liberal elements in Brazilian politics. Pro-Axis figures were weeded out of im-

# BRAZIL'S NEW TERRITORIES

The five Federal Territories of Amapá, Rio Branco, Guaporé, Ponta Pora, and Iguassú were created in Sep tember, 1943. Acre Territory was previously in existence

portant political offices. On April 19 Vargas pardoned his old enemy, former Governor José Antonio Flores da Cunha of Rio Grande do Sul, who had been imprisoned since his voluntary return from exile following Brazil's entrance into the war The holding of Anti-Fascist Week in May was an other indication of the new trend. Foreign Minister Aranha and other leading members of the Varga

regime took part in the increasing activities of the

prodemocratic "Friends of America" movement. On September 7 President Vargas hinted that he intended to modify the temporary dictatorship through which he had ruled the country since 1937. A week later he decreed the creation of five new Territories to promote economic development of frontier regions and to serve as buffers between Brazil and adjoining republics. The new Territories abutted upon Argentina, Paraguay, Bolivia, Venezuela, and Dutch and French Guiana, respectively (see outline map). They were carved out of existing States and placed under the direct administration of the President, acting through military interventors (governors). All State and municipal properties within the new Territories passed into the hands of the Federal Government.

In a speech on the sixth anniversary of his 1937 coup d'état of 1987, President Vargas on November 10 promised a "readjustment of our political structure" after the war. However he said the new structure would leave no room for the "professional politicians." The Brazilian Economic Convention, in session in Rio de Janeiro during November 25— December 18, recommended the establishment of the Ministry of National Economy called for in the 1937 constitution but never created.

BRETHREN, German Baptist (Dunkers or Dunkards). A religious organization founded in Schwarzenau, Germany, in 1708 by a group of Pietists and established in Germantown, Pa., in 1719 under the leadership of Peter Becker. There are four denominations of Brethren in the United States, the largest and oldest group being the Church of the Brethren, or Conservative Dunkers, with headquarters at Elgin, Ill. For statistics, see Religious Organiza-TIONS.

# BRICK. See Building Materials.

BRIDGES. Research work and studies in bridge design have been continued in spite of war conditions. Tests with heavy steam and electric locomotives indicate that the additional stresses caused by impact of heavily loaded wheels striking slight irregularities in the track on bridges are much lower than had been calculated, especially on bridges having the modern type of ballasted floor. For the design of the 2,800-ft. suspension bridge over the Narrows at Tacoma, Wash., to replace the one destroyed by a wind storm in 1940, a committee of engineers is studying the problems involved and will test (directly and by models) the effects of high winds on other large suspension bridges.

Suspension Bridges. The Peace River bridge on the Alaska Highway, opened on August 30, has a main span of 930 ft. and two backstay spans of 465 ft. Foundations and erection of the steel towers were carried on rapidly during the severe winter by working on the ice, 4½ ft. thick, this part of the structure being completed six days before the ice went out in the spring. The new Tacoma Bridge, noted above, must wait until after the war, but some 4,000 tons of wire and 4,000 tons of structural steel have been salvaged in demolishing the old cables and towers. At the San Francisco-Oak-

land Bridge, a small one-man Navy airplane, in a fog, flew across one of the suspension spans, breaking a vertical suspender cable. With its wings sheared off the plane and its pilot were lost in the

Steel Bridges. The American Institute of Steel Construction has discontinued until after the war its annual awards for the most beautiful bridges of the year. Two Mississippi River projects are still in abeyance. For the highway bridge at Memphis, Tenn. (authorized by Congress in 1939), the Memphis & Arkansas Bridge Commission has asked assistance of the U.S. Public Roads Administration in designing and financing. Authority for a bridge from Helena, Ark., to Friar's Point, Miss., had expired under time limits, but Congress extended the

life of the project.

At Baltimore, a bridge about a mile long over the Patapsco River is planned as part of an 8-lane express highway through the city, forming a link in the Atlantic States Superhighway. A bridge over the Thames River between New London and Groton, Conn., opened in February, has a cantilever channel span of 540 ft., with anchor arm spans of 352 ft. It carries two 24-ft. roadways, a 2½-ft. dividing strip, and two 4-ft. walks. A high-level bridge over the Norfork River at Henderson, Ark., must replace the present bridge, which will be submerged in the reservoir formed by the Norfork Dam. Foundations must be built before the water level rises.

Timber Bridges. War restrictions on the use of steel have led to an increasing use of timber truss bridges and timber trestles, composed largely of treated timbers. Interesting features are the use of concrete and bituminous paving on the wood floors of trestles, and the use of plywood and built-up members in trusses, these members being composed of pieces glued together, and sometimes shaped and bored before the preservative treatment. A Pennsylvania highway bridge, designed for 30-ton loads, has six such truss spans of 130 ft. Numerous truss bridges of 35-ft. to 125-ft. span, built on the Pan-American highway by the United States government, are composed of members shaped and bored before treatment and shipped in bundles ready for erection at their sites.

Covered wood truss bridges, frequent in pioneer days, especially in New England and the Mid-West, are becoming rare, as heavy traffic and loads require their replacement. A few are being preserved as examples of early engineering works. At Rushville, Ind., the old Howe-truss Flatrock bridge, with two spans of 123 ft., has been replaced by a concrete arch structure alongside; but by request of the Indiana Historical Society the old structure was left in place and a roadside park developed

around it.

Concrete Bridges. An arch of 886-ft. span, in the Sando Bridge, Sweden, opened early in 1943, is claimed as the longest concrete arch yet built. It carries a highway across the Angerman River and eliminates the last ferry crossing on the main road from Stockholm to Haparanda, at the head of the Gulf of Bothnia. The road is 131 ft. above the water. In the United States, concrete trestles, bridges, and culverts are numerous, but few are notable or conspicuous. Restrictions on the use of reinforcing steel have led to modified designs with more massive plain concrete. At Los Angeles, there was completed the Aliso Street viaduct, having a 6-rib arch span of 222 ft. over the Los Angeles River, together with 80-ft. box girder spans and girder spans of 40 ft. In all it is 1,808 ft. long, and carries two 2-lane roadways with an electric railway between them and two 4-ft. sidewalks. It forms a link in the city's express highway system.

Toll Bridges. Loss of tolls through severe restrictions on traffic is affecting the finances of toll bridge concerns. The Triborough Bridge Authority of New York City has faced trouble in paying interest on bonds on account of the decline in traffic. At San Francisco, the authorities in charge of the Golden Gate suspension bridge have asked the State to take over operation and maintenance, since the income suffers not only by decline of traffic but also from the large amount of free traffic by employees of the Federal Government. The State of Pennsylvania has planned to free its last toll bridges, about 12 in all.

In Florida, the State Highway Department proposes to acquire and operate free of tolls the Gandy and Davis toll roads and bridges, and to ask the Federal Government to pay half the cost. The Gandy structure, five miles in length, crossing Tampa Bay between Tampa and St. Petersburg, has 50 per cent of its length composed of a concrete trestle with 24-ft. spans, and the remainder a solid embankment. The Davis structure, crossing the bay between Tampa and Clearwater, 91/4 miles, is mainly an embankment or causeway, with less than a mile of bridge, consisting of treated timber piles supporting 20-ft. composite spans of lami-nated timber and concrete. Each bridge has a bascule span over a navigation channel. A highlevel free bridge across the Rio Grande between Laredo, Tex., and Nuevo Laredo, Mexico, is proposed by the Texas State highway department to supersede the private low-level toll bridge.

Ponton Bridges. Such bridges are used mainly in military operations, and those in civil use are generally small. A bridge to an island shipbuilding yard in Lake Ontario has a 65-ft. ponton draw span carried by four floats or pontons at each end. To open the bridge, the floats are emptied or blown out by compressed air, so that their buoyancy lifts the span from its end bearings, and it is then swung clear of the channel by tackle operated by hand. At Brookfield, Vt., a State road has a ponton bridge 294 ft. long, carried by 380 oak barrels supporting lines of chains laid lengthwise. Transverse members between the barrels and seated on the chains carry timber stringers on which is the plank deck or floor. The Corps of Engineers, U.S. Army, has adopted the term "ponton" in preference to the older term "pontoon."

Movable Bridges. A remarkable bridge of this type, which is lowered 20 ft. under water to allow vessels to pass, was built in Iraq by engineers of the British army, to the designs of Gen. C. Gifford Hull. It is 92 ft. long, weighing 35 tons, and has a roadway and railway track on a deck 15 ft. wide. It was intended to have counterbalance weights riding in wells formed by sheet piling, so that no conspicuous tall towers would be required. But as the wells were not plumb, towers had to be built for the sheaves carrying the operating cables, which are worked by hand hoists or winches. The ends of the span rest on beams which are pushed back when it is to be lowered. The same principle has been applied to lock gates in the United States.

In general, movable bridges or draw spans have not been much in evidence, but as the result of some serious accidents study has been given to the design of adequate fenders to protect the towers of both movable and fixed spans over navigable channels from injury by vessels which may be out of control. A bridge on the railway between Puerto Mexico and Campeche, in Mexico, crosses the Tancochapa River by a 63-ft. swing span pivoted at one end; the other end (except when closed and resting on its pier) is supported by rods from a tower 50 ft. high. It is swung by cables leading to hand hoists or winches.

Bridge Work. Novel methods in bridge construction, repair, and salvaging have been conspicuous. Two bridges over the Tennessee River had to be raised 14 and 25 ft. on account of the reservoir formed by the new Gilbertville Dam. With 200ton cranes and 300-ton jacks the spans were raised gradually, concrete blocks being placed to build up the piers to the new level. At Columbus, Colo., a bridge having six 80-ft, girder spans on piers or bents of steel piles has its concrete deck only 41/2 ft. above low water, as the old bridge was dilapi-dated and material for a high-level structure was not obtainable. The concrete roadway slab is anchored to the crossbeams of the piers for security during floods. Of 735 tons of steel in a viaduct crossing Little Jackfish River, Canadian National Polymers and the formula of the control of the co tional Railways, only 45 tons were new metal, the remainder having been reclaimed from old bridges. And at Lynchburg, Va., two old railway truss bridges were dismantled and the material used to form three highway bridges. Steel and timber bridges that would have been submerged in the reservoir formed by the Grand Coulee Dam on the Columbia River were salvaged by placing barges under them, pumping out the barges so as to lift the spans from their supports, and then towing the barges with the spans to sites convenient for dismantling them.

Replacement of old highway bridges that are not fitted for modern traffic and loads will be an important item in postwar reconstruction, and will help to replenish the scrap stock piles. Several old bridges, both steel and concrete, have been de-molished by army engineer forces as part of their training for war work. Such training includes not only demolition but also rapid construction and emergency restoration of bridges demolished by a

retreating enemy.

Foreign Bridges. For an international bridge at Tia Juana the Mexican government is to pay 25 per cent and the city 75 per cent. The great Howrah cantilever bridge over the Hooghly at Calcutta, opened in 1943, has a channel span of 1,500 ft., with anchor or shore arms of 325 ft. The floor, suspended from the bottom chords of the trusses, is reached by gained ramps which come to the floor is reached by spiral ramps which come to the floor level at the piers.

In Spain, a concrete bridge over the Agueda River near Fuentes d'Onoro, opened in April, has three 270-ft. arches 50 ft. high. It replaces a struc-

ture that failed Dec. 21, 1942.

The proposed Danube bridge between Giurgevo (Rumania) and Russe (Bulgaria) was approved by a joint government commission in June, work to begin in 1943 and be finished by 1948. It will carry a railway, roadway, and sidewalks. At Belgrade, a suspension bridge has been completed over the Danube to replace the structure destroyed in 1941 by retreating Yugoslavian troops. Still another Danube bridge was opened in March, near Medve, Hungary, on an express highway. It has four main spans, with a channel span of 1,968 ft. In Denmark, the Queen Alexandrine bridge con-necting roads in Zealand and Moen Island, was opened May 30. It is of steel and concrete, 2,440 ft. long. A bridge between Zealand and Funen Island is planned, to replace the Korsor-Nyborg railway car-ferry. There is a project also for a bridge between Denmark and Sweden at this point. A highway bridge over the Firth of Forth, just west of the great railway Forth Bridge, is proposed as

important for the development of Scotland. Of historical interest is the preservation of a 17th century stone arch bridge over the Derwent River in England, the bridge being on a pack-horse track or road, which will be submerged in a new reservoir. The bridge was dismantled carefully and all stones were marked for erection at some new site after the war. See Foundations.

E. E. RUSSELL TRATMAN.

## BRITISH CAMEROONS. See CAMEROONS, BRITISH.

BRITISH COLUMBIA. A province of Canada, bounded on the west by the Pacific Ocean and Alaska. Area, 366,255 square miles (including 6,976 sq. mi. of fresh water). Population (1941 census), 817,861 (435,031 male; 382,830 female). The racial origin of the population (1941 census) included 571,336 British, 41,560 Scandinavian, 24,882 Indian and Eskimo, 22,407 German, 22,096 Japanese, 21,876 French, and 18,619 Chinese. Religious memberchurch 200,817, Roman Catholic 113,282, Presbyterian 94,300, Lutheran 41,772, Baptist 29,780, Confucian 29,137. Chief cities: Victoria (capital) 44,068 inhabitants in 1941, Vancouver 275,353, New Westminster 21,967, Trail 9,392, North Vancouver 8,914, Prince Rupert 6,714, Nanaimo 6,635, Kamloops 5,959, Nelson 5,912, Vernon 5,209, Kelowna 5,118. In 1942 there were 16,798 live births, 8,860 deaths, and 10,828 marriages. Education (1941–42): 165,480 students enrolled in schools and colleges.

Production. The gross value of agricultural output for 1942 amounted to \$62,529,000 (field crops accounted for \$18,137,000, fruits and vegetables \$15,-212,000, milk \$9,974,000, farm animals \$9,824,000, poultry and eggs \$8,806,000). Chief field crops (1942): wheat 2,579,000 bu., oats 3,819,000 bu., (1942): wneat 2,579,000 bu., oats 3,819,000 bu., potatoes 75,500 tons, turnips, etc. 39,800 tons, hay 484,000 tons, alfalfa 221,000 tons. Livestock (June 1, 1943): 376,000 cattle (inc. 93,700 milk cows), 132,000 sheep, 89,800 swine, 62,170 horses, 3,561,600 hens and chickens. Apple crop (1942): 1,816,700 bbl. valued at \$6,267,500. Fur output (1941–42): 838,750 pelts valued at \$1,655,137. The net value of production in the lumber industry for 1941 was \$39,571,627. Puln and paper

dustry for 1941 was \$39,571,627. Pulp and paper output (1942): \$16,426,441 was the net value of products. Fisheries catch (1942) was valued at \$38,059,559. The salmon pack (1942) totaled \$38,059,559. The samon pack (1942) totaled 1,806,009 cases (of 48 lb. each). Mineral output (1942): \$76,665,268 (copper, zinc, etc. accounted for \$35,215,018, gold \$18,104,779, silver \$4,409,356, coal \$7,500,988). Manufacturing (1941): 1,905 plants, 62,447 employees, \$89,256,478 for wages, \$219,755,738 for cost of materials, \$181,232,637 was the net value of production.

Government. Finance (year ended Mar. 31, 1942): revenue \$38,763,546; expenditure \$31,-342,923; total direct and indirect liabilities (less sinking funds) \$159,148,632. The executive power is vested in a lieutenant governor who is advised by a ministry of the Legislative Assembly, the latter consisting of 48 members elected for a five-year term by adult suffrage (21 Liberals, 14 Cooperative Commonwealth Federationists, 12 Conservatives, and 1 Laborite were elected at the provincial general election of Oct. 21, 1941). Six Senators (appointed for life) and 16 elected commoners represent British Columbia in the Federal Parliament at Ottawa. Lieutenant Governor, Lt. Col. William C. Woodward (appointed Dec. 10, 1941); Premier, John Hart (Liberal). See Alaska and Canada under History.

BRITISH EAST AFRICA. See KENYA, NYASALAND, TAN-GANYIKA TERRITORY, UGANDA, ZANZIBAR.

BRITISH EMPIRE. The world's largest empire, comprising an area of 13,353,952 square miles and a

population of about 500,775,000. It consists of:

1. The United Kingdom of Great Britain and Northern Ireland. See Great Britain; Ireland,

NORTHERN.

2. Self-governing Dominions—Australia, Can-Ada, Newfoundland (temporarily administered by a Governor in Commission, responsible to the Crown through the British Secretary for Dominion Affairs), New Zealand, Union of South Africa.

3. EIRE (IRELAND), a sovereign, independent state, associated for certain purposes with the United Kingdom and the self-governing dominions, which are sometimes referred to collectively as the

British Commonwealth of Nations.

India and Burma.

5. Self-governing colonies—Ceylon and South-

ERN RHODESIA.

6. Crown colonies and protectorates—Aden, BAHAMAS, BARBADOS, BASUTOLAND, BECHUANA-LAND, BERMUDA, BRITISH GUIANA, BRITISH HONDU-RAS, BRITISH SOLOMON ISLANDS, BRITISH SOMALI-LAND, CYPRUS, DOMINICA, FALKLAND ISLANDS, FIJI, Gambia, Gilbert and Ellice Islands, Gibraltar, GOLD COAST, GRENADA, HONG KONG, JAMAICA, KENYA, LEEWARD ISLANDS, MALTA, MAURITIUS, NIGERIA, NORTHERN RHODESIA, NYASALAND, ST. HELENA, ST. LUCIA, ST. VINCENT, SEYCHELLES, Sierra Leone, Straits Settlements, Swaziland, Trinidad and Tobago, Uganda, Zanzibar. 7. Protectorates of a special nature—British

NORTH BORNEO, BRUNEI, FEDERATED MALAY STATES, SARAWAK, UNFEDERATED MALAY STATES—collec-

tively known as British Malaya. Also Tonga. 8. Mandates held by the United Kingdom— British Cameroons, Palestine, Tanganyika Ter-RITORY, TRANS-JORDAN, TOGOLAND (British sphere).

9. Mandates held by Dominions—Nauru (Australia), New Guinea (Australia), South-West AFRICA (Union of South Africa), WESTERN SAMOA

(New Zealand).
10. Dependencies of Dominions—Labrador (Newfoundland); ASHMORE AND CARTIER ISLANDS, Papua, Norfolk Island, Australian Antarctic TERRITORY (Australia); Union Islands or Tokelau and Ross Dependency (New Zealand).

11. Territories held under condominium—ANGLO-EGYPTIAN SUDAN (United Kingdom and Egypt), New Hebrides (United Kingdom and France), CANTON and ENDERBURY ISLANDS (United King-

dom and United States).

See the separate articles covering most of the above territories. British North Borneo, Brunei, Federated Malay States, Sarawak, Straits Settle-ments, and Unfederated Malay States are dealt with under British Malaya, and Dominica, Grenada, St. Lucia, and St. Vincent under WINDWARD ISLANDS.

Between the outbreak of World War II in 1939 and the end of 1943, British forces obtained military control over the FAEROES, ICELAND (later turned over to United States forces), ETHIOPIA (returned to Emperor Haile Selassie), ERITREA, ITAL-IAN SOMALILAND, LIBYA, IRAQ, part of IRAN, and MADAGASCAR, FRENCH SOMALILAND, and SYRIA AND LEBANON (the three latter in association with the Fighting French).

Japanese forces during 1941–42 occupied the following parts of the British Empire: BRITISH MALAYA, BRITISH SOLOMON ISLANDS, BURMA, HONG Kong, the Territory of New Guinea, Andaman IsLANDS, and some of the GILBERT AND ELLICE IS-LANDS. Final disposition of many of these occupied territories awaited the outcome of the war. See the article on each country, colony, or dependency mentioned, under *History*; also Great Britain under History; WORLD WAR.

BRITISH GUIANA. A British colony on the northern coast of South America. Area, 89,480 square miles. Population (1941 estimate), 354,219 including 152,460 East Indians. Vital statistics (1941): 12,-530 births, and 5,517 deaths. Chief towns: Georgetown (capital) 71,160 inhabitants, New Amsterdam 9,665, Springslands, Morawhanna, Bartica. Education (1941): 57,705 pupils enrolled in schools

receiving government grants.

Production and Trade. The area under cultivation amounts to some 155,000 acres, from which the principal products are sugar (191,767 tons, 1942), principal products are sugar (191,767 tons, 1942), rice (51,060 tons, 1941), coconuts, coffee, cacao, limes, citrus fruits, maize, rubber, plantains, and fibers. Livestock (1941): 140,924 cattle, 33,778 sheep, 22,889 swine, 12,146 goats, 6,394 donkeys, and 2,974 horses. The forests cover an area of 78,000 square miles and produce such timbers as greenheart beloggilli morehylas, number heart greenheart, kakeralli, morabukea, purple heart, and wallaba. In 1941 the exports of balata totaled 659,190 lb. Bauxite, diamonds and gold are the chief mineral exports. Manganese ore and mica have been found. Trade (1942): imports \$17,250,-000 (\$14,433,856 in 1941); exports \$18,500,000 (\$16,211,698). Foodstuffs, textiles, clothing, and machinery were the main imports.

Communications. Railways 79 miles, river transport 472 miles, canals 39 miles, highways 881 miles. Georgetown, British Guiana, is a port of call in the Miami, Florida, to South America air service. Shipping (1941): 3,261 vessels aggregating 2,381,689 tons entered and cleared.

Government. Budget estimates (1942): revenue £1,611,328; expenditure £1,640,425. The funded public debt, Dec. 31, 1941, amounted to £4,254,-737. Administrative and executive functions are in the hands of the Governor and the Executive Council. The new constitution which came into force on Apr. 12, 1943, provides for a reconstituted Legislative Council of 24 members—14 elected, 7 nominated, and 3 official—with the Governor as president. United States landplane and seaplane bases were established on leased sites in British Guiana (see 1942 Year Book, p. 81). Governor, Sir Gordon Lethem (appointed July 4, 1941).

BRITISH HONDURAS. A British crown colony in Central America. Area, 8,598 square miles. Population (Jan. 1, 1942 estimate), 61,068. Vital statistics for 1941 (rate per 1,000): births 34.9; deaths 16.8. There were 421 marriages. Education (1940): 11,-208 students enrolled in schools of all kinds. Chief towns: Belize, the capital, 16,687 inhabitants (1931); Corozal, 2,700; Benque Viejo; El Cayo; Baranco.

Production and Trade. Mahogany, chicle (the basis of chewing gum), bananas, grapefruit, cedar logs, coconuts, and copra were the main products. The forests (8,007 sq. mi.) produce about 80 per cent of the exports by value. Trade (1941): imports \$3,751,950; exports \$3,357,546. The United States supplied 35.8 per cent of the imports and received 70.2 per cent of the exports. Shipping (1941): 147,460 tons entered. A twice-weekly air service for mails, passengers, and express was in operation to and from San Pedro Sula, Honduras. Roads: 221

Government. Finance (1941): revenue \$1,370,-

900; expenditure \$1,378,000. Public debt (Dec. 31, 1943), \$2,500,105. The executive branch of the Government rests with the Governor, assisted by an Executive Council. The Legislative Council includes the Governor as president, 5 official members, and 8 unofficial members (2 nominated and 6 elected). Governor and Commander in Chief, Sir John Adams Hunter (appointed Nov. 18, 1939).

See Hurricanes.

BRITISH MALAYA. The British possessions and dependencies in Malaya, conquered by the Japanese in 1941 and 1942. Their areas, latest populations, and capitals, are shown in the accompanying table.

| Division (Capital)                  | Sq. mi.      | Population |
|-------------------------------------|--------------|------------|
| British North Borneo (Sandakan)     | 29.500       | 302.000    |
| Brunei (Brunei)                     | 2,226        | 39,000     |
| Federated Malay St. (Kuala Lumpur). | 27,540       | 2,212,052  |
| Negri Sembilan (Seremban)           | 2,580        | 296,009    |
| Pahang (Pekan)                      | 13,820       | 221,800    |
| Perak a (Taiping)                   | 7,980        | 992,691    |
| Selangor (Kuala Lumpur)             | 3,160        | 701,552    |
| Sarawak (Kuching)                   | 50,000       | 490,585    |
| Straits Settlements (Singapore)     | 1,356        | 1,435,895  |
| Labuan (Victoria)                   | 35           | 8,963      |
| Malacca (Malacca)                   | 6 <b>4</b> 0 | 236,087    |
| Penang b (George Town)              | 390          | 419,047    |
| Singapore (Singapore)               | 291          | 771,798    |
| Unfederated Malay States            | 22,276       | 1,912,497  |
| Johore (Johore Bahru)               | 7,500        | 737,590    |
| Kedah (Alor Star)                   | 3,660        | 515,758    |
| Kelantan (Kota Bharu)               | 5,750        | 390,332    |
| Perlis (Kangar)                     | 316          | 57,776     |
| Trengganu (Kuala Trengganu)         | 5,050        | 211,041    |

<sup>a</sup> Includes Dindings. <sup>b</sup> Includes Province Wellesley (280 sq. mi.; pop. 171,587; chief town Butterworth). <sup>c</sup> Includes Christmas Island (60 sq. mi.; pop. 1,440) and Cocos (Keeling) Islands (9 sq. mi.; pop. 1,142).

The combined population of the Federated Malay States, Straits Settlements, and the Unfederated Malay States at the end of 1989 was 5,444,-833 including 2,332,050 Chinary 2,070,001 833, including 2,332,058 Chinese, 2,259,331 Malays, 744,283 Indians, 30,319 Europeans (including the military which was later increased), and 19,046 Eurasians. Chief cities (with latest available Toyn, 165,411; Kuala Lumpur, 138,425; Johore Bahru, 97,634; Ipoh, 64,343; Malacca, 45,010; Taiping, 38,719; Seremban, 27,839; Klang, 27,948; Alor Star, 25,000; Kuching, 30,000; Kuala Trengganu, 16,000; Kota Bharu, 14,843; Sandakan, 13,-826; Brunei, 12,000.

Production. The chief products in 1940 were rubber (603,600 long tons, including that of Brunei, Sarawak, and British North Borneo), tin ore (metal content, 86,800 metric tons), coprá, rice, palm oil (57,972 tons), palm kernels (10,172 tons), iron, tea, and pineapples. Other products—sugar, areca nuts, timber, resin, phosphate, manganese, bauxite, scheelite, wolframite, and amang ore. During December, 1940, the area of tapped rubber trees was 1,632,136 acres; the area under rice, the main food 793,340 acres. Excluding Brunei, Sarawak and British North Borneo, rice production in 1939-

40 was 526,300 metric tons.

Trade. Federated Malay States, Straits Settlements, and Unfederated Malay States (1940): imports S\$830,255,000; exports S\$1,128,169,000. Exports of Malayan produce to the United States were valued at \$\$591,931,000, an increase of 84 per cent over 1939. Imports from the United States totaled \$\$38,037,000, an increase of 107.8 per cent. Gross exports of rubber, including reexports of 234,819 long tons from nearby countries, amounted to 772,767 long tons valued at \$\$629,598,000 (an advance of 68 per cent by value over 1939). Exports of tin during 1940, including reexports, amounted to 130,935 long tons.

Finance. Federated Malay States (1941 estimates, excluding war taxation and expenditure): revenue \$\$77,500,000; expenditure \$\$72,000,000. Straits Settlements budget (1941): revenue S\$46,294,000; expenditure S\$57,292,000. Unfederated Malay States (1940): revenue S\$30,642,791; expenditure S\$28,369,074. British North Borneo, Brunei, and Sarawak (actual 1939 figures): revenue S\$5,608,-752; expenditure S\$7,324,443. The average annual exchange value in United States funds for the Straits dollar (S\$) was \$0.5174 for 1939; \$0.4698, 1940; \$0.4713, 1941.

Communications. Previous to the Japanese occupation, Singapore was one of the world's leading ports, as well as the chief British naval base and administrative center in the Far East. During January-September, 1939, the net tonnage of shipping cleared from Malayan ports was 26,095,400, the bulk of it from Singapore. Railways connected Singapore with the productive parts of the Malay Peninsula and with Thailand. There were 7,878 miles of roads in 1940, and air lines extending to the principal cities of Asia and Australasia.

Government. Under the British administration, the Governor of the Straits Settlements also served as High Commissioner for the Federated and Unfederated Malay States and Brunei and as Agent for British North Borneo and Sarawak. The Straits Settlements constituted a crown colony; it was administered by the Governor with the aid of executive and legislative councils. The other Malay States were all protectorates with different degrees of British control. British Residents advised the rulers of each of the Federated and Unfederated Malay States. The Federated Malay States had, in addition, a Federal Council and their policy in Federal matters was coordinated by the High Commissioner through the Federal Secretary. British North Borneo was administered by the British North Borneo Company under a royal charter. The Sultan of Brunei in 1906 agreed to place the administration in the hands of a British Resident. Sarawak had a British hereditary ruler or rajah, Sir Charles Vyner Brooke, but a Special Commissioner represented the Governor.

History. An important development in British Malaya reported over the Japanese radio during 1943 was the cession of the four Unfederated Malay States of Kedah, Kelantan, Perlis, and Trengganu to Thailand by the Japanese Government "in gratitude for its aid." Another announcement of October 5 told of the creation of provincial and municipal councils "entirely composed of Malayans" as "a further step toward the administrative independ-ence of Malaya." The English language was reportedly retained as the international language of the region, but was renamed "Koango," meaning the "Asia Development Language." Other Tokyo broadcasts announced that construction was under way on improved highways connecting Taiping and Kota Bharu on the west and east coasts of northern British Malaya, and linking Kota Bharu with Singapore. The latter road was to follow the east coast for some 400 miles. See Japan and Tharland, under History.

BRITISH NEW GUINEA. Same as Papua. BRITISH NORTH BORNEO. See BRITISH MALAYA.

BRITISH SOLOMON ISLANDS. A large group of islands under British protection, lying in the Pacific to the east of New Guinea, which were occupied by Japanese armed forces during the first half of 1942 and largely recaptured by Allied forces in 1942–43. The most important islands are Choiseul (1,500 sq.

mi.), Florida, Gizo, Guadalcanal (2,500 sq. mi.), Kolombangara, Malaita (2,000 sq. mi.), New Georgia, Rendova, Rennell, Ronongo, Russell, San Cristoval, Santa Isabel, Shortland, Treasury (or Mono), Vella Lavella. The area within the boundaries of the protectorate amounts to about 375,000 square nautical miles (total land area, 11,000 sq. mi.). Population (1981 census), 94,105 (all Melanesian or Polynesian natives except for 497 Europeans and 193 aliens). Capital, Tulagi.

Production, etc. Coconuts, rubber, sweet potatoes, pineapples, and bananas were the chief crops. Other products: ivory nuts, trocas shell, timber, green snail shell, and bêche-de-mer. Trade (1939–40): imports £189,772; exports £180,860 (copra, 21,994 tons valued at £149,368). Finance (year ended Mar. 31, 1941): revenue £51,320; expenditure £65,848. The administration was in the hands of a Resident Commissioner (assisted by a nominated Advisory Council), acting under the authority of the British High Commissioner of the West-

ern Pacific (resident in Suva, Fiji).

History. The killing by Japanese strafing of Col.
C. N. F. Bengough, British Acting Commissioner in the British Solomon Islands, was confirmed on Aug. 31, 1943, by Sgt. T. E. Ganley, sole survivor of an Allied bomber shot down off Vella Lavella island, July 24, 1943. For the Solomon Islands campaign

during 1943, see World War.

BRITISH SOMALILAND. A British protectorate in East Africa, bounded north by the Gulf of Aden and south by Ethiopia and Italian Somaliland. It was captured by the Italians during August of 1940 and recaptured by British Imperial Forces during March of 1941. Area, 68,000 square miles; population (1938 estimate), 350,000, including 2,700 nonnatives. Chief towns: Berbera, the capital (20,-000 inhabitants in 1939), Hargeisa, Burao, Żeila, Erigavo, Borama.

Production and Trade. Livestock raising was the main occupation of the people. In 1936 the protectorate had 2,500,000 sheep, 2,000,000 goats, 1,500,000 camels, 30,000 cattle, 2,000 donkeys, and 1,000 horses. The agricultural crops include maize, barley, sorghum, and wheat Trade (1941-42): imports £635,743; exports £191,464. Cotton piece goods, rice, dates, and sugar were the main imports. The chief exports were sheep, goats, skins, myrrh, and frankincense. Shipping (1938): 158,673 tons cleared.

Government. Financial estimates (year ended June 30, 1942): revenue £216,071; expenditure £189,332. Military Governor, Col. G. T. Fisher (assumed office in March, 1943).

BRITISH SOUTH AFRICA. See South Africa, Un-ION OF.

BRITISH WEST AFRICA. See CAMEROONS, BRITISH; Gambia; Gold Coast; Nigeria; Sierra Leone.

BRITISH WEST INDIES. The colonial possessions of Great Britain in the West Indies, comprising three main groups of islands: (1) Bahamas, (2) Jamaica and adjacent islands, and (3) other islands scattered throughout the Lesser Antilles (Leeward Islands, Windward Islands, Barbados, Trinidad, and Tobago). Bermuda, British Guiana, and British Honduras (q.v.) are excluded. The area and pop-ulation of the British West Indies, by main island groups, are shown in the accompanying table. The

inhabitants are for the most part Negroes.

Production, etc. Agriculture is the main occupation in virtually all of the islands, the chief crops being sugar (432,500 tons, 1942), coconuts, cotton,

citrus fruits, cocoa, vegetables, and (in Jamaica) bananas. The tourist business, manufacturing for local consumption, and (in Trinidad) the production of petroleum and asphalt are the other leading sources of income. There is no unified governmental system, the island groups listed above constitute separate colonies, each with a governor appointed by the Crown and with varying degrees of popular representation in their legislative bodies. See the separate article on each colony and its main subdivisions.

| Island group (Capital)  | Sq. mi.                                       | Pop. (1941)  |
|---|---|--|
| Bahamas (Nassau).  Barbados (Bridgetown). Jamaica a (Kingston). Leeward Islands (St. John). Trinidad & Tobago (Port of Spain). Windward Islands (St. George's). | 4,404<br>166<br>4,720<br>422½<br>1,980<br>820 | 71,474<br>197,956<br>1,253,620<br>97,644<br>506,316<br>274,046 |

a Including dependencies. b 1940 estimate.

History. The first report by Sir Frank Stockdale, Comptroller for Development and Welfare in the British West Indies, was published as a White Paper in London early in 1943 ("Development and Welfare in the West Indies, 1940–42." Col. No. 184. H.M. Stationery Office, Is. 6d. net). His report described the plans and measures adopted for the improvement of public health, agriculture, labor conditions, social welfare, and education under the Colonial Development and Welfare Act passed by the British Parliament in 1940 (see 1941 Year Book, p. 92). Development schemes proposed up to September, 1942, involved a total expenditure of £5,894,324, of which £1,202,725 had been approved.

In addition to this program of economic and social rehabilitation, the British Government early in the year accepted most of the demands for constitutional reform put forward by the political parties in Jamaica (which see). Meanwhile the Anglo-American Caribbean Commission, established in 1942 proceeded with its studies and plans aiming at the economic and social development of British and American possessions throughout the Caribbean on a regional basis (see 1943 YEAR BOOK, p. 96). According to a statement made by the British Colonial Secretary in the House of Commons March 16, the Commission in its first year of operation had made a good start in attacking problems com-mon to the whole Caribbean area. It was working, he said, on fishing research, venereal disease and other medical questions, broadcasting, and the provision of materials required for carrying out the British West Indies development schemes under the Colonial Development and Welfare Act.

The fourth meeting of the Commission was held at Charlotte Amalie, Virgin Islands of the United States, in August. It decided to create an advisory Caribbean Research Council to promote scientific, technological, social, and economic research on the problems of the region. The Council was to operate through committees for agriculture, forestry and fisheries, health, sociology, and industry. A provisional sub-committee selected land tenure as the white the the first desided agricultural study.

subject for the first detailed agricultural study.

A three-day conference of British colonial import controllers in the British West Indies, Bermuda, and the Bahamas was held in New York City in April to coordinate shipments of foodstuffs and essential supplies to those islands. Representatives of the United States and Canadian Governments attended. British West Indian troops were sent to Dominica on May 11 in connection with the crisis that had developed in the nearby French posses-

sions of Martinique (which see) and Guadeloupe. See *The Caribbean Islands and the War*, a report prepared by the U.S. Section of the Anglo-American Caribbean Commission and released by the State Department Dec. 13, 1943.

BROOKINGS INSTITUTION. An organization devoted to public service through research and training in economics and government. It maintains a division of training in which only those who have had at least two years of graduate work are accepted as research fellows. Due to the war, the usual fellowships for graduate study were not granted for the academic year 1943–44.

In carrying out its purpose to aid constructively in the development of sound national policies without regard to the special interests of any group, the Institution conducted during 1943 several investigations, some of which dealt with problems of the war effort. The resulting studies were published under the following titles: World Minerals and World Peace, by C. K. Leith, J. W. Furness, and Cleona Lewis, The New Philosophy of Public Debt, by H. G. Moulton; Belgian Banking and Banking Theory, by B. S. Chlepner; and How Nazi Germany Has Controlled Business, by L. Hamburger. Four additional pamphlets were published in the series, Price Making in a Democracy, by Edwin G. Nourse. Other pamphlets included: Is There Enough Manpower? by Harold W. Metz; Collapse or Boom at the End of the War? by H. G. Moulton and Karl T. Schlotterbeck; Do We Want a Federal Sales Tax? by Charles O. Hardy; Rationing and Price Control in Great Britain, by Jules Backman; The Price Control and Subsidy Program in Canada, by Jules Backman.

The Institution is supported from endowment funds and annual grants from philanthropic foundations. The officers of the board of trustees for 1943-44 were: Chairman, Dwight F. Davis; vice chairman, Dean G. Acheson; president, Harold G. Moulton; vice president, Edwin G. Nourse; treasurer, Henry P. Seidemann; and secretary, Elizabeth H. Wilson. Headquarters are at 722 Jackson Place, Washington, D.C.

BROOKLYN INSTITUTE OF ARTS AND SCIENCES. One of America's oldest and largest institutions for informal education, located in Brooklyn, N.Y. Its public activities are conducted at four centers: The Department of Education at the Academy of Music, the Central Museum, the Children's Museum, and the Botanic Garden. Founded in 1824, the Institute was incorporated in its present form in 1890. Total membership is about 4,500 and is open to everyone.

The Department of Education at the Academy of Music presents an adult education program annually of concerts, lectures, forums in every major field of the arts and sciences. Approximate attendance at these events for the season 1942–43 was 220,000. The Institute's Museums possess collections in art, ethnology, and natural science. On June 25, 1941, the Art and Photography Classes formerly conducted at the Department of Education at the Academy of Music were transferred to the Brooklyn Museum to form the new Art School of the Brooklyn Museum. Attendance at both Museums for the year 1943 totaled 604,444. The Institute's Botanic Garden comprises more than 50 acres and plant houses containing tropical and sub-tropical species. Botanic Garden attendance during 1943 totaled 1465,790.

Mr. Edward C. Blum is Chairman of the Board of Trustees and Mr. Adrian Van Sinderen President of the Brooklyn Institute. Julius Bloom is Director

of the Education Department at the Academy of Music; Mrs. Laurance P. Roberts, Director, Museums; Mrs. William Lloyd Garrison, 3d, Curatorin-Chief of the Children's Museum; Dr. George M. Reed, Acting Director of the Botanic Garden. Executive offices are located in the Academy of Music, 30 Lafayette Avenue, Brooklyn.

BRUNEI. See British Malaya.
BRUNSWICK. See GERMANY under Area and Population.

BUDGET. See Public Finance; countries under Finance. For Budget Message, see Taxation; also, United States.

BUDGET, Bureau of the. A division of the Executive Office of the President which assists the President in the preparation of the Budget and the fiscal program of the Government. Its chief branches pertain to Legislative Reference, Estimates, Administrative Management, Statistical Standards, and fiscal programs (the Fiscal Division). Special activities at the present time include the War Projects Unit, which reports upon all war construction projects and makes recommendations toward increased efficiency and economies, the Committee on Records of War Administration, and the Equipment and Supply Section, which surveys supplies in Government agencies and assists in the redistribution of surpluses. Director: Harold D. Smith. See Public Fnance.

BUHL FOUNDATION. See PHILANTHROPY under Foundation Activities.

BUILDING AND LOAN ASSOCIATIONS. See table under RECONSTRUCTION FINANCE CORPORATION.

BUILDING MATERIALS. Sharply divergent trends characterized the chief branches of the building materials industry in 1943. The sharp drop in construction (q.v.) which brought total building activity down from 13½ billion dollars in 1942 to well below eight billion dollars in 1943 was reflected in a correspondingly sharp contraction in cement output. However, while this was a planned contraction, the year also witnessed a decline in lumber output which was decidedly undesired. Lumber became one of the scarcest materials in 1943 due mainly to rapidly mounting manpower shortages in the woods. Lumber not only became the chief bottleneck holding up any relaxation in private construction activities, but also posed serious difficulties in supplying crating and boxing needs for military and essential civilian purposes.

The decline in lumber and cement supplies last year as measured by official index figures was as follows:

BUILDING MATERIAL SUPPLIES [Federal Reserve Board Index] 1935-39 = 100

| 1939 | 115<br>129<br>130 | Cement<br>114<br>122<br>154<br>171<br>129 |
|------|-------------------|---|
| 1943 | 117               | 129                                       |

Among other major building materials for which partial statistical data are available, window glass production averaged 1,118,000 boxes monthly for the period from January to August of 1943 when publication of these figures was temporarily discontinued. This represented an average of 68.8 per cent of the industry's capacity, compared with an average monthly production of 1,316,000 boxes per

month in 1942 for an average capacity utilization of 81.2 per cent.

Gypsum production in 1943 showed a decline of approximately 16 per cent for crude gypsum and 18 per cent for calcined gypsum. (Fourth quarter gypsum figures are estimated.)

Contrary to this trend, paint sales actually increased last year. Sales of paint, varnish, lacquer, and fillers averaged 48 million dollars monthly for the first ten months of 1943, as against a monthly average of 44 million dollars in 1942.

Building material prices during the year showed a gradual increase, caused primarily by higher lumber prices. Lumber ceilings were raised by the Ofice of Price Administration in an attempt to stimulate production. Price movements for a group of selected building materials was as follows:

BUILDING MATERIAL PRICES [Bureau of Labor, 1926 = 100]

|      |      | Building<br>Material<br>Group | $egin{array}{c} Brick \ and \ Tile \end{array}$ | Cement | Lumber | Paint<br>Materials |
|------|------|-------------------------------|---|--------|--------|--------------------|
| 1943 | Jan  | 109.8                         | 98.7  | 94.2   | 133.3  | 100.6              |
|      | Feb  | 110.2                         | 98.6  | 94.2   | 134.6  | 101.2              |
|      | Mar  | 110.4                         | 98.7  | 94.2   | 134.6  | 102.2              |
|      | Apr  | 110.3                         | 98.7  | 94.2   | 134.7  | 102.5              |
|      | May  | 110.5                         | 98.9  | 93.9   | 135.6  | 102.2              |
|      | June | 110.6                         | 99.0  | 93.6   | 136.3  | 102.0              |
|      | July | 110.7                         | 99.0  | 93.6   | 137.1  | 102.0              |
|      | Aug  | 112.2                         | 99.0  | 93.6   | 142.0  | 102.8              |
|      | Sept | 112.5                         | 99.0  | 93.6   | 142.7  | 102.6              |
|      | Oct  | 112.7                         | 99.0  | 93.6   | 143.1  | 102.8              |
|      | Nov  | 113.1                         | 100.0   | 93.6   | 143.9  | 103.2              |
|      | Dec  | 113.4                         | 100.0   | 93.6   | 144.0  | 103.3              |

Lumber and building material sales by wholesalers dropped to 4,228 millions of dollars as compared with 4,791 millions of dollars in 1942, but even at this reduced rate it was still considerably ahead of the 2,543 millions of dollars registered in 1939 when the total new construction volume for private and public construction together was slightby above six billions of dollars.

Retail sales of building materials and hardware (not separated in official U.S. Department of Commerce data) dropped to 3.2 billions of dollars in 1943 as against 3.8 billions of dollars in 1942, and 2.7 billions of dollars in 1939.

Lumber. Total lumber production in 1943 reached approximately 32½ billion feet according to the Lumber Survey Committee of the Department of Commerce. This was 10 per cent less than the 1942 output and reflected the fact that on Nov. 1, 1943, the labor deficiency for the lumber industry was estimated at 25 per cent of the number of employees needed for maximum operation.

While production for the year actually came up to the goal set by the Lumber and Lumber Products Division of the War Production Board, it must be realized that this goal was based on estimates of possible production rather than on demand. The 1943 lumber consumption for military and essential civilian uses actually was over 3 billion board feet short of estimated lumber consumption. As a result, stocks of lumber at mills and in distributors' hands declined to a dangerously low level. Mill stocks on Oct. 31, 1943, were down to 3,675 million feet or approximately 30 per cent below those of a year ago. The decline in inventories was further intensified by the fact that log reserves also became wholly inadequate.

The shift in lumber use was highlighted by the fact that military demands for boxing and crating lumber soared from approximately four billion feet in 1942 to approximately 15 billion for 1943, with little evidence in sight that this demand will be any less in 1944. The consumption of nearly 50 per cent of the total national output for this type of

lumber has thrown off the calculations of many who foresaw a reduction in demand for military use in 1943.

The decline in lumber production did not affect all producing areas alike. Preliminary figures show that in the Pacific Northwest area, the decline in production amounted to only 8 per cent from 1942 levels. Results in the South, where Southern Pine is the principal product, were much more unfavorable, however. The Southern Pine industry failed to meet its 1942 production record by approximately 20 per cent owing to a reduction from approximately 11¾ billion board feet in 1942 to about 9.5 billion feet in 1943.

Lumber production and consumption trends are pictured in the following table:

LUMBER PRODUCTION AND CONSUMPTION

|                         |  | Consumption b                                  |  |   |
|-------------------------|--|--|--|---|
| (Million<br>Board feet) | Production                             | Total  | Soft-<br>woods                                 | Hard-<br>woods                            |
| 1943 4                  | . 35,700 b<br>. 32,880 c<br>. 28,932 c | 35,012<br>42,510<br>34,927<br>30,547<br>26,438 | 28,108<br>34,555<br>28,995<br>26,169<br>22,392 | 6,904<br>7,955<br>5,932<br>4,378<br>4,046 |

<sup>a</sup> Estimated. <sup>b</sup> Lumber Survey Committee. National Lumber Manufacturers Association.

The largest buyer of lumber in the nation today is the Corps of Engineers of the War Department which acts as the central procurement agency of lumber for the Army, the Navy, the Maritime Commission, and other Federal agencies and their primary contractors. Approximately 20 per cent of all lumber purchased in the nation in 1943 was acquired by this agency, according to a report on current lumber industry problems issued by the Patman House Committee on Small Business. According to this report, the Corps of Engineers on Dec. 31, 1943, had pressing orders on its books for more than a quarter of a billion feet of Southern Pine which it had been unable to locate and acquire for essential war uses

The growing scarcity of lumber was reflected in a tightening of lumber restrictions by the War Production Board. Most lumber types were placed under strict allocation late in 1943, through issuance of two new Conservation Orders which became effective Jan. 1, 1944. These orders were M-361 on Southern Pine, and M-364 on the distribution of seven leading hardwood lumber species. Under M-361 the Southern Pine production of war mills cutting 10,000 feet or more is now reserved for purchase by the war agencies or their contractors, including the Central Lumber Procuring Agency.

Further curtailment of civilian consumption in industrial uses of lumber was provided by Limitation Order L 260-a which now limits manufacturers of furniture to 84 per cent of the amount of lumber they used in 1943. The Furniture Limitation Order also went into effect Jan. 1, 1944. Shipments of furniture manufactured during the first ten months of 1943 were 12 per cent less than during the corresponding period of 1942, according to monthly reports of the National Association of Furniture Manufacturers. Production of furniture dur-

ing the same period showed a drop of 22 per cent.
Production of oak flooring declined constantly
during the year. For the first ten months of the year the oak flooring industry consumed approximately 250 million feet as against 364 million feet for the same period in 1942. Lumber consumption in the maple flooring industry during the first ten months of 1943 totaled 60 million feet compared with 96 million feet for the same period of 1942.

Railways (q.v.) were hard hit by difficulties in

obtaining adequate supplies of cross ties and lumber for maintenance and repairs and had to rely largely on their inventories.

Cement. After establishing a record for shipments of 185,301,000 barrels in 1942, operations in the cement industry slumped during 1943 as the war construction program began to taper off. Shipments for 1943 totaled approximately 127,000,000 tons, lowest total for any year since 1939.

The drop in demand was more severe in the East, where war construction had started earlier, than in the Southeast and Southwest. The net decline, for example, was only about 5 per cent in Virginia, Florida, Georgia, and Louisiana, as against a maximum of 46 per cent in New York and Maine.

Shipments during the last half of 1943 totaled 62,000,000, a decline of 5,000,000 barrels from the total for the first half. This decline was contra-seasonal, as the latter half of the year normally accounts for a much larger proportion of the year's total. In 1942, for example, shipments in the first half totaled approximately 79,000,000, and in the latter half 106,000,000. The aim of the industry is normally to produce as evenly as possible, in so far as storage facilities permit.

Production declined slightly less than shipments in 1943, and as a result, stocks increased. For the first eleven months, production totaled 125,103,000 barrels, a decline of 26 per cent from the 168,643,-000 barrels produced in the corresponding period of 1942. This meant an operating rate of only 40 to 45 per cent of capacity for the year. Shipments for the eleven months were 121,925,000 as against 176,312,000,000, a decline of 31 per cent. Stocks, including clinkers, at the end of November, 1943, totaled 25,567,000 barrels, as against 15,088,000 barrels at the end of November, 1942.

Earnings in the cement industry declined sharply as a result of the drop in sales and the rise in costs. Chief factor in the rise in costs was the increase in basic wage rates as well as the payment of overtime rates at plants where the 44 and 48 hour week was adopted as a result of local manpower shortages.

The decline in the demand for cement relieved the manpower shortage of the industry during the latter half, but new problems emerged as a result of policies adopted by Government agencies.

The Federal Trade Commission, after an investigation that lasted for several years, issued a cease and desist order against the use of basing point pricing system which the cement and other industries have used for many years. This order is being appealed by the cement companies named in the complaint on the grounds that the basing point system does not violate the law covering fair trade practices

In September, the War Production Board's Committee on Transportation and Stockpiling issued an order establishing zones and barring long-hauling of cement, with a view to effecting savings in transportation. Although the industry maintained that the order would result in virtually no savings in transportation, the WPB made only minor changes in it subsequently in response to the industry's protests that it was the only trade shipping its product in box cars that was affected by such restrictions.

New uses were developed for cement last year in such applications as bathtubs and manhole covers, to meet shortages of other materials. Such shortages hindered cement as well as aided it, however. Limited scheduling of concrete reinforcing bars by the War Production Board's steel Division, and the shortage of lumber were contributing factors in restricting wider use of cement last year.

BULGARIA. A Balkan monarchy. Capital, Sofia. King Boris III, who succeeded to the throne Oct. 8, 1918, died Aug. 26, 1943, and was succeeded by his six-year-old son, Simeon II.

Area and Population. Excluding areas annexed from Greece and Yugoslavia in 1941, but including 2,982 square miles of Southern Dobruja, with a square nines of southern Dorldy, with a population of 378,344, annexed from Rumania on Sept. 7, 1940, Bulgaria has an area of 42,797 square miles and a population estimated at 6,700,000 on Jan. 1, 1941. Following the German invasion of Virgalization and Guardin Livia. sion of Yugoslavia and Greece in April, 1941, Bulgaria occupied a large part of Yugoslav Macedonia, and the Greek territories of Western Thrace, Eastern Macedonia, Florina, and Castoria. The area of these territories was estimated at 15,875 square miles and the population at about 1,690,000. In 1943 the total area claimed by Bulgaria was about 58,670 square miles with 8,500,000 inhabitants. Excluding Dobruja and the other newly annexed territories, living births in 1941 numbered 135,899 (21.3 per 1,000); deaths, 79,901 (12.5); marriages, 55,435 (8.7). The infant mortality rate declined steadily from 144 per 1,000 living births in 1938 to 123 per 1,000 in 1941. Estimated populations of Sofia on Jan. 1, 1942, 401,300; of other cities in 1941: Plovdiv (Philippopolis), 113,000; Varna, 78,000; Ruse (Ruschuk), 52,000; Burgas, 41,000.

Defense. See 1943 YEAR BOOK.

Education and Religion. At the 1934 census 20.4 per cent of the males and 42.8 per cent of the females were illiterate. In 1938-39 there were 252 remales were interate. In 1933–39 there were 252 kindergartens with 12,702 pupils, 4,743 public elementary schools with 596,111 pupils, 2,044 secondary schools with 360,786 pupils, and one State University (at Sofia) with 6,030 students. The American College at Sofia, with about 400 students, was closed Sept. 12, 1942. The 1934 census showed 5,128,890 members of the Otherdox Church of 5,128,890 members of the Orthodox Church of Bulgaria, 821,298 Moslems, 48,398 Jews, 45,704 Roman Catholics, 23,476 Armenian-Gregorians, and 8,371 Protestants.

Production. About four-fifths of the population live by agriculture and fishing. Production of cereals in 1940 was estimated at 3,400,000 metric tons (3,560,000 in 1939); tobacco, 140,800,000 lb. in 1942; rose oil, 1,600 kilograms in 1940; cotton, about 14,000 tons in 1940; beet sugar, 40,000 metric tons in 1940-41; raw silk, 192 metric tons in 1940. Other production was (in metric tons): Lignite, 2,784,000 in 1942; coal, 25,605,000 in 1940; cement, 194,000 in 1988; salt, 77,000 in 1938. Annual output of the mining industry, valued at 956,000,000 leva, is about 6 per cent of the total industrial production.

Foreign Trade. Including bullion and specie, imports in 1942 totaled 12,924,000,000 leva (10,238,-000,000 in 1941); exports, 13,416,000,000 leva (9,240,000,000 in 1941). Tobacco, fruit, eggs, wheat, hides, and wine are the chief exports. In 1940 Germany supplied 70 per cent of the imports and took 59.2 per cent of the exports. In subsequent years the German share of Bulgaria's trade increased.

Finance. Budget estimates for the calendar year 1942 were (millions of leva): Receipts, 14,402; expenditures, 17,800 (7,860 for war). The 1943 estimates called for expenditures of 22,600 millions (8,500 millions for defense). Actual 1941 returns (millions of leva): Receipts, 13,778; expenditures, 16,424 (6,791 for war). Public debt on Dec. 31, 1942 (millions of leva): Internal, 28,464 (consolidated, 14,022; floating, 14,442); external, 12,311 at the current rate of exchange. Comparative debt totals for Dec. 31, 1941 (in millions of leva): Internal, 16,967; external, 12,604. At the official exchange rate, 1 lev equaled 0.0305 reichsmark. At the published exchange rate in July, 1943, 84 leva equaled \$1.00 U.S., but in actual practice the rate was said to be 300 leva to the dollar.

Transportation. Bulgaria in 1942 had more than 2,130 miles of state-owned railway lines, over 19,-600 miles of highway, and air lines connecting with the chief cities of Axis Europe. A number of new railways of both economic and strategic importance were constructed during 1941-43. The railways in 1942 carried 17,779,300 passengers, a 27 per cent increase over 1941. A new all-weather highway connecting the Bulgarian cities and Danubian ports with the Adriatic at Durazzo, Albania, and Antivari, Yugoslavia, was completed early in 1943. The Danube is an important traffic artery. Three new luxury steamers and other improved transport facilities were placed in operation in 1943 to handle in-

creased traffic.

Government. The Constitution of 1879 remained suspended from the Georgiev coup d'état of May 19, 1934, through 1943. All political parties were dissolved in 1934 and the formation of new ones was prohibited. King Boris ruled as virtual dictator after overthrowing Premier Georgiev's dictatorship on Jan. 22, 1935. The parliaments elected in March, 1938, and in December, 1939—January, 1940, were deprived of practically all legislative powers. The former political parties were not permitted to pre-sent candidates or otherwise participate in the electoral campaigns. Deputies were elected on a personal basis and government manipulation of the electoral machinery produced pro-government ma-jorities (of 140 out of 160 members of the Sobranye in the latter elections). Premier at the beginning of 1943, Bogdan Philov, heading a non-party cabinet reorganized Apr. 12, 1942.

The Government of Bulgaria adhered to the Three Power Pact, or Axis military alliance, Mar. 1, 1941. On the same date German armed forces were openly permitted to enter Bulgaria, which they used as a base for subsequent attacks upon Yugo-slavia and Greece (see 1942 YEAR BOOK, p. 86f.). On Apr. 24, 1941, Bulgaria declared that a state of war "existed in those areas of Greece and Yugo-slavia occupied by Bulgarian troops." It declared a state of war with Great Britain and the United States Dec. 13, 1941, "in accordance with Article 3 of the Tripartite Pact." Bulgaria adhered to the Anti-Comintern Pact Nov. 25, 1941, but remained at peace and in diplomatic relations with the Soviet Union. For 1943 developments, see below.

### HISTORY

Bulgaria's Dilemma. As the tide of war turned steadily against the Axis during 1943, the Germans intensified their persistent efforts to force Bulgaria into the armed struggle with the Soviet Union. The danger that Hitler would oust the Sofia Government and rule the country as an occupied province hung over Bulgaria throughout the year. But again, as in 1941 and 1942, the Germans were balked by the strong pro-Russian sentiments of the Bulgarian masses and by the opposition of a minority of the Bulgarian Cabinet. If the Government sent troops to fight in Russia, it faced the virtual certainty of internal revolution. it faced the virtual certainty of internal revolution. Moreover it would link Bulgaria's fate more closely to a doomed cause. On the other hand, open desertion of the Axis would mean not only German military rule but also the loss of the territories

Bulgaria had gained from Rumania, Greece, and Yugoslavia with German aid.

The Bulgarian Government accordingly played for time while seeking a way out of its dilemma that would enable it to save as much as possible from the impending Axis collapse. It was reported to have made repeated efforts to open secret peace negotiations with the Great Britain and the United States. Meanwhile it yielded to German demands for increased military aid against the Yugoslav and Greek guerrillas. Bulgarian and German forces jointly prepared to resist a threatened Anglo-American invasion from the Aegean Sea or Turkey.

In return for this aid the Bulgarians during the summer of 1943 occupied additional Greek territories between the Struma and Vardar Rivers. Large numbers of Bulgarian peasants reportedly were settled in the occupied regions of Greece and Yugoslavia, from which many thousands of the former inhabitants had fled or been driven, in order to bolster Bulgaria's postwar claims to these territories. As a counterweight to German demands for aid against Russia, King Boris and his Cabinet demanded still greater territorial gains at the expense of Greece and Yugoslavia.

In the midst of this complex and dangerous crisis, King Boris died mysteriously at the end of August. The Germans immediately took a firmer

grip on the mechanisms of military and political power. But they did not succeed in breaking the resistance of the Bulgarian people to the pro-German policy of the Sofia Government. Resistance to Axis. Early in December, 1942,

large-scale anti-Axis and anti-war demonstrations had broken out in Bulgaria. They were inspired by the German defeats in North Africa and at Stalingrad (see 1943 YEAR BOOK, p. 99). These demonstrations and other forms of resistance continued with growing violence during the first months of 1943. They served to counteract in-creased pressure from Germany and from pro-German elements in Bulgaria for intervention in the Russian struggle. Reports seeping out of the country during January and February told of large-scale demonstrations, strikes, and attacks upon police stations and government offices by workers and students in many Bulgarian cities; clashes with troops and the police, in which both sides suffered numerous casualties; great numbers of arrests and some executions; mutinies among some Bulgarian troop units; the sabotaging of communications, etc.

The opposition consisted of a sizable under-ground Communist movement operating in close liaison with Moscow; the strong non-Communist left-wing agrarian bloc which formed part of the "tolerated opposition"; intellectuals; students; and many other pro-democratic or anti-German ele-ments, including some leading politicians and army officers. The reserve officers of the strongly nationalist Zveno Club, who organized the military revolt of 1934, strongly opposed the pro-German policy of the King and his Government. Former Premier Nicholas Mushanov and the Democratic Entente leader, Atanas Burov, vigorously protested the dictatorship and its repressive policies. Members of the "tolerated opposition" in the largely hand-picked Parliament were equally outspoken in their criticism. On the other side were aligned the King, most of the members of the Cabinet and Parliament, many ardently pro-Ger-man army officers, and the various pro-Nazi and

strongly anti-Communist political groups.

Extremist enemies of the Government met its repressive measures with bloody terrorism. They carried on a campaign of assassination that claimed

110 victims among pro-German government functionaries up to the end of May. Among the prom-inent victims was Gen. Christo Lukov, former War Minister and leader of a Nationalist faction demanding immediate intervention against Russia, who was shot and killed in mid-February. Sotir Janev, president of the Foreign Affairs Committee of Parliament, personal adviser to the King, and editor of the semi-official Slovo, met the same fate on April 15. On May 2 Col. A Pantev, president of the military court in Sofia and former chief of the State police, was assassinated. Each killing was the signal for a new police drive against oppositionists.

Meanwhile the Germans continued to move additional troops into Bulgaria and to strengthen defense installations along the Aegean coast, the Turkish frontier, and the Black Sea coast. Large numbers of residents of the coastal areas were evacuated inland. Toward the end of March the Government began new large-scale deportations of Jews to Germany and Poland in accordance with German demands. The vice president of Parlia-ment was ousted on March 27 for criticizing the deportations as "cruel, inhuman, and often unjusti-

Germany Increases Pressure. On March 31 Hitler received King Boris at his general headquarters and had a long and detailed talk with him about German-Bulgarian collaboration and friendship." This announcement by the Berlin radio inaugurated another lengthy period of acute political tension in Bulgaria. The King's return to Sofia was accompanied by reports that Hitler had demanded immediate payment in the form of military aid against Russia for the new territories Bulgaria had acquired with German help. Hints that Boris had agreed to this demand "in principle" were sufficient to revive anti-Axis demonstrations and riots throughout the kingdom. In many large towns, the Government was forced to declare a state of siege.

The Philov Cabinet again split over the issue. It was indicated that the pro-German majority favored a war declaration on the ground that the Bulgarian people could not resist a fait accompli, while the anti-German members pointed to the country-wide disturbances as proof that the nation would refuse war with Russia at all costs. The King vainly sought to achieve unity within the

Cabinet in support of his policy.

May Day brought new anti-Government outbreaks of such severity that the King and his key Ministers reportedly left Sofia for Plovdiv. Police and troops in the capital fired on great crowds with machine guns on May 4-5, according to Berne reports. Martial law was declared, newspapers banned, and all stores closed for two days. The termination of these restrictions brought no relaxation of tension. The political crisis continued week after week, despite the reported presence of the German Gestapo Chief, Heinrich Himmler, to assist in crushing opposition

Renewed anti-Government rioting broke out in Sofia May 26 when the police began the deporta-tion of Jews from the Sofia ghettos to the Reich and Poland. In mid-June the Government appointed a 20-man commission to mobilize national sentiment against sabotage, subversive activity, grain hoarding, and Communist activity. But large numbers of Bulgarians continued to display violently anti-Axis sentiments. Meanwhile the Govern-

ment wavered on the brink of war with Russia.

The downfall of Mussolini on July 25, coming on the heels of continued Allied victories, caused panic among pro-Germans in Bulgaria and instilled new vigor into the opposition. King Boris and Premier Philov were reported to have quarreled violently over the responsibility for the king-dom's desperate position. Some Bulgarian Fascists were beaten up on the streets of Sofia, according to the British radio. There were violent scenes in Parliament, with opposition Deputies attacking the Government and demanding peace.

Death of Boris. The collapse of Italian fascism

and new German reverses in Russia forced Hitler to rush German troops into the Balkans and to call on the satellite states for increased military aid. King Boris, however, showed signs of wavering in his attachment to the Axis cause. He received in audience ex-Premier George Kiosseivanov, whose sympathies with the Anglo-American powers were well known. Attempting to broaden the base of the Government and to insure his regime against a German collapse, he reportedly asked former Premier Mushanov and two other leaders of the "tolerated opposition" to join the Cabinet

and help to form a government of national union. In the midst of these discussions, Hitler again called Boris to his general headquarters during the third week of August. The Fuehrer was said to have presented the King with a virtual ultimatum, demanding the acceptance by midnight on August 28 of the following demands: (1) immediate and total mobilization of Bulgaria's armed forces and economic resources for the prosecution of the war, (2) creation of a German-manned defense line along the Turkish frontier, and (3) a free hand for the German political police in Bulgaria to crush anti-German demonstrations and terrorism.

The King returned to Sofia on August 24 to consult his Cabinet. On August 27 the Berlin radio announced that Boris had been seriously ill for three days with angina pectoris. The same day Swiss reports stated that the King had been shot by an assassin immediately following his return from Hitler's headquarters. Moscow charged that he had been poisoned by the Germans. A procla-mation read by Premier Philov over the national radio on August 28 stated that Boris had died that afternoon "after a brief but grave illness." Another proclamation, which the Premier read imparts the state of the proclamation of the premier read imparts the premier re mediately afterward, announced that six-year-old Crown Prince Simeon had ascended the throne under the name of Simeon II and that in accordance with the Constitution the Cabinet would rule until the establishment of a regency.

The Regency. The announcement of the King's death initiated another acute political crisis. Opposition elements launched new demonstrations against the Government. Premier Philov asked Mushanov, leader of the "tolerated opposition," for a 40-day political truce during the period of national mourning for Boris. Mushanov refused when the Cabinet turned down his demand for a revision of Bulgaria's foreign policy. The Germans meanwhile had acted to forestall the overthrow of the Government by seizing control of the Bulgarian army, police, and communication and transportation facilities, with the cooperation of friendly Bulgarian officials. A strict censorship isolated Bul-garia from the outside world for 72 hours while the Gestapo rounded up suspected Allied agents and pro-Soviet Bulgarian leaders.

This prompt action enabled the Germans to maintain control temporarily through a compliant Bulgarian regime. Premier Philov, after consulting Hitler, called a special session of Parliament on September 7, at which three regents acceptable to the Germans were chosen. They were Philov

himself, Prince Cyril, a brother of Boris, and Lieut. Gen. Nikola Michov, the Minister of War.

The Philov Cabinet resigned on September 12, and a new Government headed by Philov's former Finance Minister, Dobri Boshilov (Bojilov), was formed the following day. The new Cabinet was notable for the absence of Philov's strongly pro-Nazi but highly unpopular Minister of Interior, Petar Gabrovski. However the Government remained subservient to Berlin. Boshilov was said to be under the thumb of Regent Philov, who in turn took his directions from the German Minister, Gustav Beckerle.

Additional German divisions were rushed into Bulgaria and preparations intensified for defend-ing the kingdom against an Allied or Turkish attack. The Berlin radio on October 22 revealed that a conference had been held between Hitler, the Bulgarian Regents Philov and Prince Cyril, and their highest military aides. This was followed by Yugoslav reports that the Regents had yielded to Hitler's demands and were moving more Bulgarian troops into Yugoslavia.

Meanwhile there were reports of serious friction between the Regents and Queen Ioanna, widow of Boris; of continued agitation against the Government's pro-German policy; and of the initiation of a more conciliatory policy toward the Opposition by the Government. There were also signs of im-proved Bulgarian-Soviet relations. Another acute political crisis developed after an Allied bombing of Sofia's railway yards on December 10. The U.S. Government on December 11 and Russia on December 27 again warned Bulgaria to withdraw from the war. At the same time the Allied Governments rejected new indirect Bulgarian peace feelers. In mid-December there were further resignations from the Cabinet. A rigid censorship was clamped down on outgoing communications. There were indications that the conflict between pro-German and anti-German forces in Bulgaria was reaching its climax. See GERMANY and GREECE under History.

BURGLARY. See FEDERAL BUREAU OF INVESTIGA-TION; INSURANCE.

BURMA. A British dependency in southeastern Asia, occupied by Japanese armed forces in 1942. Total area, 261,610 square miles, comprising Burma proper, the Chin Hills and Kachin Hills Tracts (192,158 sq. mi.), Shan States (62,335 sq. mi.), and unadministered territory (7,117 sq. mi.). The census of Mar. 5, 1941, showed a population of 16,824,000, as compared with 14,667,146 at the 1931 census. About two-thirds of the people were of Burmese race. The remainder were distributed among scores of other races, chiefly Shans, Karens, Indians, Chinese, Kachins, and Chins. During the Japanese invasion 500,000 persons, including half the Indian population, were evacuated from Burma to India. Buddhists comprise over 84 per cent of the total population; the rest are mainly Animists, Mohammedans, Hindus, and Christians. Chief cities (1931 populations): Rangoon, 400,416; Mandalay, 147,932; Moulmein, 65,506. Education (1939–40): 8,270 recognized schools and colleges with 639,259 students, and 18,745 unrecognized schools with 212,663 students. with 212,663 students

Production. Four-fifths of the people are engaged in agriculture. With some 60 per cent of the cultivated area devoted to rice, Burma is the world's leading rice exporter, normally shipping abroad some 3,000,000 tons annually. Yields of the chief crops (in metric tons) were: Rice, rough, 8,198,000 in 1940–41; sesamum, 52,800 in 1939–40; groundnuts, 193,000 in 1939–40; cotton, 20,000 in 1940–41; rubber, 9,600 in 1940. Indian millet, corn, and beans are widely grown for domestic consumption. In 1939–40 the output of teak from the reserved forests totaled 307,997 tons.

Mineral output (in metric tons): Tungsten, 3,529 in 1938; lead, 78,600 in 1939; tin, 5,400 in 1939; petroleum, 1,116,000 in 1940; zinc, 55,800 in 1938; silver, 192.1 in 1939. Burma is one of the leading producers of rubies. In 1938 there were 1,019 industrial establishments (including over 600 rice mills) with 86,400 employees. The large mills, smelters, and oil refineries were British-owned.

Foreign Trade and Finance. Imports in 1940 were valued at 270,350,000 rupees; exports, 531,120,000 rupees (rupee averaged \$0.3016 for 1940). India supplied 63 per cent of the imports and took 52 per cent of the exports (mostly rice), while the rest of the British Empire supplied 18 per cent of the imports and took 32 per cent of the exports. United States exports to Burma rose from \$1,765,080 in the first nine months of 1938 to \$13,310,015 for the same period of 1941. The Japanese conquest in May, 1942, ended all trade with non-Japanese sources and cut off the large transit trade to China via the Burma Road.

Budget estimates (1941–42): revenue Rs171,-300,000; expenditure Rs182,800,000. The bulk of the foreign debt was held in Great Britain.

Transportation. Economic life centers around the Irrawaddy and other great rivers, which offer the principal means of transportation and communication. Previous to the Japanese invasion, one shipping company operated a fleet of 1,000 river boats. Railways extended 2,266 route miles in 1939–40 and carried 4,000,000 tons of freight and 18,920,000 passengers. The Burma Road, opened in January, 1939, from the railhead at Lashio in northern Burma to Kunming, China, was Free China's principal trade route until blocked by the Japanese capture of Rangoon in February, 1942. The highways in 1940 aggregated 12,138 miles. Air services connecting Rangoon with Chungking, China, and the chief cities of India were disrupted by the Japanese occupation.

Government. Burma was separated from India on Apr. 1, 1937, and given its own constitution and government. Previous to the Japanese occupation in 1942, the executive power was vested in a Governor (appointed by the British Crown) who was advised by a council of ministers of not more than 10 members. The Governor had control over foreign affairs. Domestic affairs were administered by a Burman ministry, responsible to a Burman Legislature consisting of a Senate of 36 members (18 elected by the House of Representatives and 18 appointed by the Governor) and a House of Representatives of 132 elected members. Large areas in the northern and eastern hill districts were excluded from the legislature's control and placed under the jurisdiction of the governor. Upon the Japanese invasion, the British Governor (Sir Reginald Dorman-Smith), the Burmese Premier, and certain other Burmese officials set up headquarters at Simla, India. A few British officials of the Burma Government remained in charge of unoccupied districts of northern Burma.

On Aug. 1, 1942, the Japanese instituted a form

of government made up of a joint Burmese and Japanese administration under the nominal leadership of U Ba Maw, a former Premier of Burma. Under this arrangement the Burmese Parliament disappeared. The supreme power rested with the Japanese commander in chief. For developments in 1943, see below.

History. At the end of March, 1943, the Tokyo radio announced that Emperor Hirohito had granted an audience to three Burmese leaders of the Japanese-Burmese administration at Rangoon-Dr. Ba Maw; Maung Mya, Director of Internal Affairs; and Major Gen. Aung Sang, commander in chief of the pro-Japanese Burmese forces. About the same time reports from Burma stated that the Japanese had restricted the activities of the Burmese National Independence party, which they had subsidized for two years prior to their invasion. Burmese nationalists were reported restive at the Japanese delay in granting independence. Apparently seeking to allay Burmese unrest, Premier Tojo of Japan announced that Burma would be granted independence within a year. However he declared that the Shan States and Karenni would not be included in independent Burma. Two of the Shan

States—Kengtung and Mong Pan—were ceded by the Japanese to Thailand (which see).

During the summer of 1943 the Japanese established a "Burma Independence Preparatory Committee" of 25 Burmese. On August 1 the Tokyo radio announced that through agreements concluded with Burmese collaborationists the same day the Japanese military administration was abolished and "independence" granted to Burma. The name of the Burma Independence Preparatory Committee was changed to "National Assembly." The members named Dr. Ba Maw as Premier of a new government, which immediately issued a declaration of war against Great Britain and the United States. This was followed by the signature of a treaty of alliance by Ba Maw and the Special Japanese Ambassador, Renzo Sawada, pledging the puppet regime to military, political, and economic cooperation with Japan. Burma thus received the same sort of "independence" as Manchukuo, with final authority resting in the hands of the Japanese Ambassador.

While the Japanese conquerors were seeking by these concessions to win the collaboration of the Burmese, the Anglo-American powers were preparing for the invasion and reconquest of Burma. The British-Indian force which invaded Burma from Assam beginning Dec. 19, 1942, in an effort to capture Akyab and drive the Japanese out of Arakan was halted in the jungles north of Akyab after a 60-mile penetration. The following May it was driven back to its original bases. Meanwhile British and native irregular forces carried out a three-months raid in central and northern Burma, disrupting Japanese communications.

Preparations for a more formidable Allied invasion of Burma reached an advanced stage in the autumn with the establishment of the Southeast Asia Command under Adm. Lord Louis Mountbatten. Meanwhile British and American air forces based in India carried out increasing attacks upon Japanese bases and supply lines in Burma to pave the way for the Allied attack. In May U.S. heavy bombers destroyed an oil refinery at Syriam near Rangoon which the Japanese had rebuilt following its destruction at the time of the British evacuation. By mid-September the U.S. air commander in India declared that nine-tenths of the Japanese military facilities in Burma had been pulverized by Anglo-American air attacks. British and American engi-

neers meanwhile were building the Ledo Road from the Indo-Burmese frontier across the Naga Hills into northern Burma to serve both as an invasion route into Burma and as a future permanent supply route into China. The Japanese were also reported building a railway line southeastward from Moulmein in Burma to a point west of Bangkok in order to connect the railway networks of Burma and Thailand and facilitate the supply of Japanese forces in Burma (see map under THAILAND). See China, India, and Japan under History.

BUSINESS REVIEW. All-out conversion to war production was achieved by American industry in 1943. For the year as a whole, production for war registered an increase of 54 per cent over 1942. In the final quarter of 1943, war production was estimated by the War Production Board to be 73 per cent higher than the 1942 annual rate. That the performance of the fourth quarter of 1943 represents the approximate peak was indicated by the WPB estimate that such production for the whole of 1944, assuming that the war would continue throughout the year, would be 80 per cent larger than in 1942. See WAR PRODUCTION BOARD.

Persistent expansion of munitions production lifted industrial activity to new peaks. The index of industrial production of the Federal Reserve Board, which was drastically revised during the year to make it reflect more fully activity in war industries, rose to 245 per cent of the 1935-39 level by the end of the year. This compared with an average of 199 per cent of the 1935–39 level during 1942. Concentration upon armament production lifted output of durable goods to almost 375 per cent of the 1935–39 level, as compared to an average of 279 for 1942, while production of nondurable goods, in large part for civilian use, showed a much smaller increase. The index of nondurable goods production at the end of 1943 approximated 175, as compared with an average of 158 for all of 1942.

The course of business activity during 1943, and comparisons with preceding years, was as follows:

INDICES OF INDUSTRIAL PRODUCTION FEDERAL RESERVE BOARD

|                | Industr            | ial products<br>1935–3 | ion (physic<br>89 = 100 | cal volume)  |

| December       | 245                | 374                    | 175                     | 140          |

The most striking development of the year was not the spectacular further rise in war production, however, but the ability of industry to turn out almost as large a volume of civilian goods as in the previous year. In fact, with the help of relatively large inventories on hand, civilians could buy more goods and services in 1943 than in 1942. The Department of Commerce estimated total civilian expenditures for goods and services at approximately \$90,500,000,000 for 1943, as compared with \$82,-000,000,000 the year before. When allowance is made for higher prices, it is probable that physical volumes were little changed for the year.

War Controls. The distribution of raw materials for war production functioned smoothly during most of the year under the Controlled Materials Plan, which provides for allocations of scarce materials between the various war agencies and to civilians on a quarterly basis, after round table discussions among representatives of each claimant agency. The labor shortage, widely feared as the ultimate bottleneck in war production, proved less serious than anticipated because increasing efficiency in war plants reduced manpower needs. The nation's labor force was expanded by some 4,200,-000 persons, including those entering the armed forces, during the year ended July, 1943, and it was officially stated that "the supply of workers in the nation as a whole is expected to be more than adequate to meet anticipated needs" for the year ending July, 1944, although labor shortages were serious in some war production centers. See LABOR CONDITIONS under EMPLOYMENT. The transportation problem also was solved reasonably well during the year, without the need for resorting to priorities on the railroads (q.v.). The abatement of the submarine threat to shipping and completion of pipelines to carry petroleum to the Eastern Seaboard area helped the railroads to absorb the larger volume of other freight and passenger traffic offered to them, total movements by rail rising to new record levels

A sharp curtailment in military construction of all kinds and cutbacks in production of tanks, ordnance, and ammunition because output largely exceeded current requirements raised the question whether restrictions on civilian output could be relaxed even though the war was not yet at its most intense stage and the second front had yet to be opened. Strong opposition was manifested within the armed services and some of the Government agencies to any considerable relaxation of such controls. It was feared not only that restrictions, once relaxed, could not be reimposed, but that the psychological effect of such action would be distinctly adverse to the intensity and pace of the whole war effort. Hence, apart from limited relaxation of restrictions on production of a few consumer items such as baby carriages and flatirons, WPB orders drastically limiting the use of strategic materials for civilian goods, and prohibiting production of most consumer durable goods, remained in effect. Relaxations of controls on a larger scale were anticipated only after the successful establishment of a second front in Western Europe.

The cancellation of many war contracts brought up the question of the policies to be pursued in connection with war contract termination, and the disposal of the huge quantities of surplus equipment and materials that would then be left in the hands of the Government. The Office of War Mo-bilization set up a special unit to tackle this problem, which prepared a Uniform Contract Termination Article to be included in future Government contracts, and with the consent of the contractor in existing ones. This Uniform Article provided for reimbursement to contractors of their costs plus a profit up to 2 per cent on any processed materials and up to 6 per cent on the total costs allowed. To facilitate both termination and surplus disposal, a Readjustment Division was set up by the Army Service Forces.

Complaints about the distribution of civilian goods under the condition of general scarcity that prevailed were heard frequently through the year. The War Production Board, after extensive consultations with wholesale and retail distributors, drafted a Distribution Order laying down general principles designed to assure fair distribution of available goods, but this order had not been issued by the end of the year. Despite constant pressure for upward revisions of price ceilings from a number of directions during the year, the Office of Price Administration succeeded in keeping wholesale and retail prices on a fairly even keel, although the trend was generally upward. (See articles on the above and other government agencies also, UNITED STATES under Production.)

Wholesale and Retail Trade. Consumer purchasing power expanded consistently during 1943, reflecting increases in employment, higher wages and longer working hours, expansion of farm income, and some increase in profits. Income payments to individuals for the year, with December estimated, aggregated \$142,000,000,000, as compared with \$116,000,000,000 in 1942. The distribution of this income in 1943 compared as follows with the year before:

INCOME PAYMENTS TO INDIVIDUALS (Billions of dollars)

|   | 1942      | 1943                      |
|---|-----------|---------------------------|
| Salaries and wages. Other labor income. Entrepreneurial income and net rents. Interest and dividends. | 3.4<br>22 | 101<br>3.8<br>27.6<br>9.6 |
| Total income payments   | 116       | 142                       |

Industry could not provide anything like the volume of goods and services that consumers would have purchased with this increased income. However, all retail sales increased during the year, the Department of Commerce reporting sales of all retail stores in the first ten months to be 9.1 per cent higher than the year before. Sales of durable goods declined further because of drastic restrictions on their production, but sales of nondurable goods were generally higher, as shown in the accompanying table:

SALES OF RETAIL STORES

The increase in the dollar volume of retail sales during the year was caused by a number of unusual factors not present in normal times. Prices were generally held down by OPA ceilings, but there was a general upgrading of merchandise as manufacturers tended to cut down output of low-priced lines and expand production of higher grade goods subject to higher price ceilings. Furthermore, there were many instances of substitutions of cheaper materials and packaging where others were

not available, and workmanship of many items tended to suffer because of manpower difficulties encountered by the manufacturers. Retailers found it necessary to curtail delivery and other services given customers, furthermore, because of the labor shortage and restrictions on gasoline and tires. Therefore, consumers generally felt that the cost of living had increased far greater than the 3 per cent rise shown in the index of the Bureau of Labor Statistics, and unit prices received by manufacturers and distributors averaged considerably higher than in 1942. The War Production Board and the Office of Price Administration (qq.v.) formulated special measures to stimulate output of lower priced lines by manufacturers, but trade circles were dubious that these would attain the desired objective. (See Living Costs.)

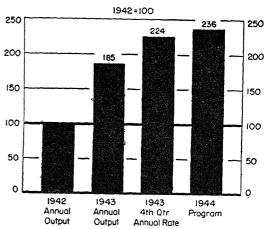

Basic Industries. Conditions in basic industries were determined chiefly by shifts in war production. New construction for war declined 31 per cent during 1943 from the 1942 level, and by the fourth quarter of 1943 the decline was 54 per cent from the annual rate of the year before. This decline reflected not only the completion of most industrial plants erected for war work and the War Production Board's policy of not approving new projects of this kind that could not be completed in 1943, but also a sharp decline in work on military and naval installments and camps. Construction contracts in 37 States east of the Rockies were estimated by the F. W. Dodge Corporation at \$3,274,000,000 for 1943, as compared with \$8,255,-000,000 for 1942. Of the total for 1943, \$2,695,-000,000 consisted of publicly-owned building and \$579,000,000 of private construction. A good deal of unemployment developed among building workers, and many building materials also became freely available as the volume of construction declined. However, restrictions on civilian production were not relaxed because the labor thus released and many of the materials might be needed for war purposes after establishment of the second front. See Construction Industry.

Minerals production increased but slightly during the year, since mines had generally been worked at capacity in 1942. As war needs passed their peak, an easing of the supply situation in aluminum, copper and steel, the three major raw materials for war, occurred late in 1943. The Government accumulated large stockpiles, particularly of aluminum, and by the end of the year steps were being taken to cut down production of this metal. A more favorable supply situation was reflected also in a resumption of publication of some metal statistics at the end of the year. See articles on important minerals.

The iron and steel industry (q.v.) was affected adversely by coal strikes, but total production for the year aggregated 89,000,000 tons of ingots, as compared with 86,000,000 tons for 1942. Steel supplies were sufficiently adequate by the end of the year to raise the question of halting construction on new producing facilities not yet completed.

The machinery industry, like construction, was greatly influenced by the change in the war program incident to the completion of plant construction and concentration upon a maximum output of munitions. Shipments of machine tools declined from \$132,000,000 for December, 1942, to \$71,-

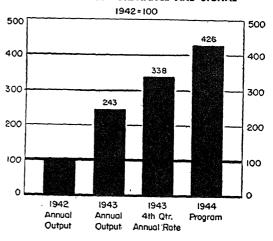

### TOTAL MUNITIONS PRODUCTION

000,000 for November, 1943, the lowest monthly total reported in several years. Other types of industrial machinery manufacture showed a similar declining trend. See Machine Building; Machinery Industry.

Armament Production. Production for war rose at a more gradual pace during 1943 than in 1942. Substantial increases were made in every major branch of munitions production for the year as whole. However, by the fourth quarter of the year a substantial decline had occurred in tank production, the railway locomotive companies shifting back to making engines for Russia and for liberated areas in North Africa and Europe. The War Production Board made public statistics on production of major types of munitions, and the program for 1944, as shown in the accompanying charts. (For fuller report, see War Production Board.)

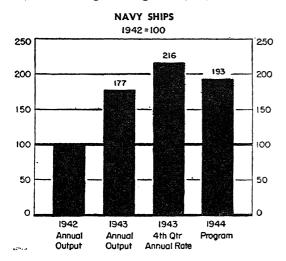

The outstanding achievement in armament production during the year was the output of 86,000 aircraft of all types, which compared with 49,000 produced in 1942. Furthermore, a far larger proportion of the 1943 output was in heavy bombers and fighters, and a much smaller proportion of trainer planes. The aircraft manufacturing industry became the largest in the country in 1943, accounting for an aggregate output of the value of \$20,000,000,000 during the year, of which \$12,000,000,000 was accounted for by aircraft plants alone.

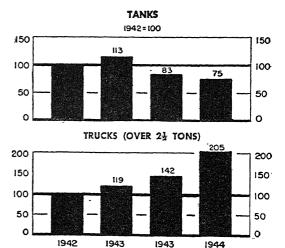

# MUNITIONS PRODUCTION INDEX

Includes ships, planes, tanks, guns, ammunition, and all field equipment.

The industry employed 2,500,000 persons at the end of the year. (See Aeronautics.) An equally impressive record was achieved by the nation's shipyards, which built 1,896 merchant ships with a total deadweight tonnage of 19,238,000 in 1943.

The merchant fleet produced in American ship-yards during 1948 was 20 per cent greater than all the merchant fleets of the world combined in 1939. Naval shipbuilding was equally impressive, but its figures are a military secret in time of war. (See NAVAL PROGRESS; SHIPBUILDING.)

Other Industries. Civilian goods industries had to cope with increasing manpower shortages and with inability to get some of the materials they required. Furthermore, difficulties were encountered in obtaining needed machinery and replacement parts in many instances. In the face of these obstacles, the total volume of production compared favorably with 1942. It should be noted, however, that a considerable part of the output of many of these industries, and in the case of such basic items as cotton goods some 60 per cent, was required for military and war production use. In fact, so great were military textile requirements that the War Production Board required all mills to devote a specified proportion of their output to military and other preferential orders, thus greatly limiting the quantities that would be sold for ordinary civilian use. The level of production in a number of manufacturing industries late in 1943, as compared with 1942, is shown in the table on p. 94, the index numbers being percentages of the 1935-39 average. See the articles on various branches of industry.

Commodity Prices. Price stabilization was more successful in 1943 than in preceding years, the wholesale price index of the Department of Labor rising less than 2 per cent for the year. The Office of Economic Stabilization (q.v.) was responsible for the price and wage control program, under Judge Vinson as director, but all production and stabilization agencies were made subject to the Office of War Mobilization, of which Justice James S. Byrnes was named director.

Source: Journal of Commerce, quotations for New York City unless otherwise indicated. \*Only products without ceilings are cotton and turpentine.

In the face of Congressional and labor opposition, the Administration took a particularly drastic step to halt the rise in commodity prices and wages with the issuance of the "Hold-the-Line" order on Apr. 8, 1943. This order barred increases in commodity prices, and froze salaries and wages at the October, 1942, level, except to correct inequalities and substandards of living. It also barred changes in jobs to secure higher pay. Subsequently, the Administration sought to bring prices of several foods back to the October, 1942, level, to head off union opposition to wage stabilization efforts, under a rollback and subsidy program. Meats, dairy products, fruits, and vegetables were chiefly affected by this program. Retail price ceilings were reduced, and simultaneously subsidy payments were paid to processors so that they would not have to lower the prices they pay agricultural producers. Farm organizations, as well as representatives from agricultural States, bitterly opposed this rollback and subsidy program, claiming that it was an unnecessary sop to labor and that it would lead to intolerable

regimentation of agriculture.

Wholesale price indices for recent years, and for each month of 1942 and 1943, are tabulated in the accompanying table:

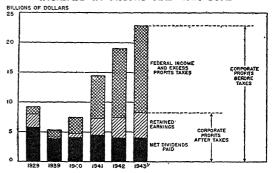

WHOLESALE PRICE MOVEMENT (1926 = 100)

| Years               | Combined<br>Index | Farm<br>Products | Foods            | Other Com-<br>modities       |

| Year                | 98.8              | 103.1            | 105.9            | 122.6                        |

With price ceilings in effect, retail prices were generally unchanged during the year, except for certain individual readjustments ordered by OPA to correct inequalities, or to reflect higher whole-sale prices. A number of food prices were reduced as a result of the rollback program. See FOOD IN-DUSTRY, etc.; LIVING COSTS.

Industry Earnings. Corporate profits after taxes aggregated approximately \$8,000,000,000 during 1943, as compared to \$7,200,000,000 in 1942. The increase in profits reflected further increases in war production and the tendency for producers to raise efficiency and lower costs as their experience with munitions manufacture increased.

# INCREASE IN PROFITS AND TAX LOAD

The Department of Commerce estimated that earnings before taxes exceeded \$22,000,000,000 in 1943, as compared with \$19,200,000,000 in 1942, while Federal income and excess profits taxes were well over \$14,000,000,000, as compared to some \$12,000,000,000 a year before.

The above profit figures are after taxes, but be-fore reserves for contingencies which many corpo-rations set aside, but which the Treasury does not allow as deductions from taxable income under existing law. Corporate annual reports show that a considerable part of the profits as reported above is set aside in reserves for postwar conversion, for inventory losses, and for other specified and un-

specified postwar contingencies. The actual extent to which these reserves will be needed, of course, will depend upon the policies which the Govern-ment will finally adopt for termination of war contracts, for reconversion of industry, for the payment of severance wages to discharged employes and

other aspects of the postwar transition.

Complaints about the renegotiation of war contracts by the Price Adjustment Boards of the Army, Navy, Maritime Commission, and Treasury, despite recognition of the fact that the personnel of the Boards generally endeavored to do a fair and conscientious job, led to the introduction of bills in Congress to modify or repeal war contract renegotiation legislation. Amendments designed to assure war contractors the right to appeal to the courts against renegotiation settlements proposed by the Price Adjustment Boards, to exempt many types of contracts from renegotiation, and to make renegotiation apply to profits after taxes, rather than before, were attached to the 1943 revenue bill, but final action on this measure was not taken by the end of the year. Repayments to the Government as a result of renegotiation of war contracts exceeded \$5,000,000,000, and it was estimated that a net amount of about \$1,500,000,000 was recovered after allowing for taxes that would have been paid upon such refunded profits.

Failures and Reorganizations. Business failures declined to the lowest level in a number of years, although many small concerns liquidated voluntarily. A high level of consumer purchasing power and capacity production in industries working for war cut sharply both the number of failures and the liabilities involved. Statistics of failures, issued by Dun & Bradstreet, for the first eleven months of 1943 compared with the corresponding period of

1942 as follows:

# COMMERCIAL FAILURES—BY DIVISIONS OF INDUSTRY

|  | Number |                                   | Current 1 (thousands o                       |   |
|--|--------|-----------------------------------|--|---|
|  | 1942   | 194 <b>3</b>                      | 1942   | 1943  |
| Manuf. and Mining Wholesale Trade Retail Trade Construction Commercial Services. | 716    | 539<br>241<br>1,693<br>379<br>224 | 29,203<br>10,836<br>38,029<br>9,043<br>6,702 | 18,220<br>2,891<br>12,161<br>5,208<br>4,804 |
| Total  | 8,899  | 3,076                             | 93,813                                       | 43,284                                      |

It was estimated that a decline of about 200,000 occurred in the total number of business concerns in the United States during 1942-43, chiefly because of a subnormal number of new promotions to replace concerns voluntarily liquidated. This was similar to what happened during the last World War. With the end of hostilities and the return of millions of persons from the armed forces, along with relaxation of restrictions on civilian industry it is expected that promotions of new businesses will be at a very high level for several years, as was the case in 1919 and 1920. For railroad reorganizations, see RAILWAYS.

Foreign Trade. The foreign trade of the United States was at a very high level because of lend-lease shipments. Apart from lend-lease, export trade was limited by the shortage of shipping and limited supplies of goods available, while imports for other than war purposes were limited by shipping and other restrictions. Without lend-lease, imports were larger than exports, giving the United States an unfavorable balance of trade on a cash basis. See Trade, Foreign.

Foreign traders urged the relaxation of restrictions on trade with Latin America and with North

Africa, claiming that many Government controls were being kept in force longer than necessary, so that they were being placed at a disadvantage as compared with British exporters in some markets. The Government set up the Foreign Economic Administration (q.v.) during the year to take over the old Board of Economic Warfare and other Government agencies concerned with economic activities abroad. It was felt, however, that greater integration between foreign trade promotion agencies and the State Department was necessary to protect American trade interests for the postwar period.

World Business Trends. Business conditions in the British Empire for the most part resembled closely those in the United States during the year. Production for war was maintained at a high level, but consumer goods supplies became somewhat more plentiful because of lend-lease and the greatly improved shipping situation. The Axis countries, on the other hand, suffered from the growing success of the arms of the United Nations, and the relentless blockade to which they were subjected. Severe suffering throughout Italy accompanied the military collapse of that country and heavy fighting on Italian soil. The Allied Military Government ameliorated the situation in the territory liberated from

German occupation to some extent.

Latin America was generally prosperous due to heavy exports of many staple commodities at high prices to the United Nations, considerable spending by this country in nations that have joined us in the war, and the stimulation to domestic manufactures resulting from inability to import manufactured goods in desired quantities from abroad. Large exports and curtailed imports gave these countries a favorable balance of payments, although a number of them remained in default on bond issues they had sold abroad. Latin American central banks generally gained gold and dollar exchange under these conditions, thus building up their foreign buying power in anticipation of the postwar period when consumer goods and industrial railroad equipment can again be purchased freely. Inflation control was a major problem in all of these countries, since price stabilization is far more difficult under the less-developed economic conditions prevailing there.

Commodity price movements in major countries compared as follows:

(a) Jan. to June 1939 = 100. (b) 1926 = 100.

A crop failure caused a severe food shortage in large parts of eastern India. Failure to take remedial measures in time brought on a severe fam-ine in Bengal. While India was able to repatriate all government bonds outstanding in London, and also accumulated very large sterling balances under the terms of her agreement with Great Britain covering the division of war costs, commodity prices tended to rise to a distressing extent as consumption by troops of the United Nations and inability to import rice and other staples from nearby areas that had been occupied by Japan created internal shortages.

A review of the agricultural situation is to be found under Agriculture and of labor under Labor Conditions. See the countries under *Production*; Banks and Banking; Consumers' Cooperation; Financial Review; Postwar Planning; Trade, Foreign.

# CAMBODIA. See FRENCH INDO-CHINA.

CAMEROONS, British. A territory in West Africa, administered by Great Britain under a League of Nations mandate conferred on July 20, 1922. Area, 34,081 square miles. Population (1939), 868,637. Palm oil, cacao, rubber, and bananas were the main products. Trade (1939): imports £225,907; exports £424,871. Finance (1939): revenue £109,264; expenditure £183,912. Shipping (1939): 510,690 tons entered and cleared the ports of Victoria and Tiko. During 1942 a member was appointed to represent the people of British Cameroons in the Legislative Council of Nigeria. Administrator, the Covernor of Nigeria.

CAMEROUN, French. A territory in western Africa, mandated to France by the League of Nations in

1922. Area, 162,934 square miles. Population (Jan. 1, 1940), 2,609,000. Capital, Yaoundé (20,000 inhabitants). Education (1939): 160 schools and 16,262 pupils. Chief products: groundnuts, maize, palm oil, cacao, gold, diamonds, hides, timber, and ivory. Livestock (1939): 900,000 oxen, 25,000 asses. Communications: 3,105 miles of roads, 314 miles of railways. Trade (1938): imports 215,212,000 francs; exports 251,959,000 francs. Budget (1938): revenue 139,439,747 francs; expenditure 118,328,574 francs (franc averaged \$0.0288 for 1938). French Cameroun adhered to the Free French (later Fighting French) movement in August, 1940, and thus came under the jurisdiction of the French Committee of National Liberation at Algiers in 1943.

There were 5,900,536 males and 5,606,119 females at the 1941 census. Of the white population in 1941, 5,715,904 were of British origin (English, 2,968,402; Scottish, 1,403,974; Irish, 1,267,702; other, 75,826) and 3,483,038 of French origin. In 1941, 5,254,239 inhabitants resided in rural districts and 6,252,416 in urban communities. Populations of the chief cities in 1941 (final figures), with 1931 figures in parentheses, were: Montreal, without suburbs, 903,007 (818,577); Toronto, 667,457 (631,207); Vancouver, 275,353 (246,593); Winnipeg, 221,960 (218,785); Hamilton, 166,337 (155,547); Ottawa, 154,951 (126,872); Quebec, 150,757 (130,594); Windsor, 105,311 (98,179); Edmonton, 93,817 (79,197); Calgary, 88,904 (83,761); London, 78,264 (71,148); Halifax, 70,488 (59,275); Verdun, 67,349 (60,745); Regina, 58,245 (53,209); Saint John, 51,741 (47,514); Victoria, 44,068 (39,082); Saskatoon, 43,027 (43,291); Three Rivers, 42,007 (35,450).

Immigration declined from 16,994 arrivals in 1939 to 7,576 in 1942; in the latter total were 5,098

Immigration declined from 16,994 arrivals in 1939 to 7,576 in 1942; in the latter total were 5,098 from the United States and 2,259 from the United Kingdom. During the year ended June 30, 1943, 14,541 persons moved permanently from Canada to the United States and 5,306 moved permanently from the United States to Canada. Up to Mar. 31,

1941, almost 6,000 child refugees and 1,200 mothers from Great Britain arrived in Canada. Living births in 1942 numbered 271,981 (23.4 per 1,000); deaths, 112,864 (9.7 per 1,000); marriages, 127,-368 (10.9 per 1,000). The birth rate was highest in Quebec (28.0 per 1,000) and lowest in Saskatchewan (20.0 per 1,000).

Education and Religion. At the 1931 census, 95.7 per cent of all persons over 10 years could read and write. Of a total school population of 2,433,370 in 1941, 2,197,804 were in provincially-controlled schools (2,075,909 in ordinary and technical day schools), 112,884 in privately-controlled schools, 17,425 in Dominion Indian schools, and 105,257 in universities and colleges (48,835 in courses of

university standard).

The principal religious groups in Canada at the 1941 census were: Roman Catholics, including 185,657 Greek Catholics, 4,986,552; United Church (Methodists, Congregationalists, and Presbyterians), 2,204,875; Anglicans, 1,751,188; Presbyterians) ans (not included in United Church), 829,147; Baptists, 483,592; Lutherans, 401,153; Jewish, 168,367. Of the 2,927,990 Canadians of French origin in 1931, 2,849,096 were Roman Catholics.

Production. The estimated gross value of production in 1941 was \$9,250,795,729 and the estimated net value \$4,720,073,033. Of the net value, manufactures accounted for 55.19 per cent, agricultural products 20.14 per cent, mining 10.55, forestry 8.93, construction 5.71, and electric power 3.88. It was estimated that at Jan. 30, 1943, there were 625,000 Canadian males in the armed forces, 820,-000 in war industries, 1,020,000 in agriculture, 683,000 in essential civilian industry and 787,000 in less essential industry. The estimated money national income increased from \$4,566,000,000 in 1939, the latest prewar year, to \$7,500,000,000 (preliminary) for 1942. See Aluminum; Asbestos; COAL; GOLD; IRON AND STEEL; MERCURY; NICKEL.

Agriculture. Preliminary returns of the 1941 census of agriculture showed 784,760 occupied farms with 1,246,622 farm workers of whom 993,324 were members of the farm operators' families. The total area sown to field crops was 55,895,937 acres as against 57,925,483 acres in 1931; wheat acreage decreased from 26,355,136 in 1931 to 21,881,871 in 1941. The gross value of agricultural production in 1942 was estimated at \$2,086,361,000 (\$1,379,-386,000 in 1941). Of the 1942 total, field crops accounted for \$1,145,778,000; farm animals, \$409,-192,000; milk production, \$273,991,000; poultry and eggs, \$131,282,000.

Estimated production (third estimate) of grain crops in Canada in 1943, with 1942 production in parentheses, was (in bushels): Wheat, 293,660,000 parentneses, was (in busness): Wheat, 293,560,000 (556,134,000); oats, 482,000,000 (528,450,000); barley, 215,562,000 (259,156,000); rye, 7,143,000 (24,742,000); buckwheat, 6,243,000 (5,207,000); mixed grains, 35,656,000 (68,622,000); flaxseed, 17,911,000 (14,992,000); shelled corn, 7,775,000 Vields of root and other gross was a Patence, 49 Yields of root and other crops were: Potatoes, 48,-541,000 cwt. in 1943 (42,882,000 in 1942); turnips, etc., 85,690,000 cwt. (32,866,000); hay and clover, 17,238,000 tons (16,061,000); alfalfa, 3,891,000 tons (3,731,000); fodder com, 4,097,000 tóns (4,401,000); grain hay, 1,259,000 tons (1,668,000); sugar beets, 473,300 tons (716,000). (4,401,000); grain The total gross farm value of all field crops produced on 60,345,600 acres in 1943 was \$1,104,-065,000, compared with \$1,179,073,000 from 60,-809,200 acres in 1942.

The value of all livestock at the 1941 census (preliminary returns) was \$609,470,373, of which domestic animals accounted for \$579,795,536 and

poultry and bees for \$29,674,837. There were on Canadian farms on June 1, 1943, 2,775,000 horses, 9,665,000 cattle, 8,148,000 swine, and 3,459,000 sheep. The 1942 wool clip was 12,867,000 lb.,

worth \$3,283,000.

Manufacturing. In 1941 Canada had 26,293 manufacturing establishments (25,513 in 1940), with a capital of \$4,905,503,966 (\$4,095,716,836 in 1940) and 961,178 employees (762,244 in 1940). Salaries and wages paid in 1941 totaled \$1,264,862,643 (\$920,872,865 in 1940); cost of materials, \$3,296,547,019 (\$2,449,721,903); net value of products, \$2,605,119,788 (\$1,942,471,238); gross value of products, \$6,076,308,124 (\$4,529,173,316). Of the 1941 gross value of manufactured products, iron goods accounted for \$1,483,169,765 (\$906,103,-(\$738,432,443); wood and paper products, \$897,978,448 (\$738,432,443); wood and paper products, \$892,936,114 (\$750,631,337); nonferrous metal products, \$726,348,447 (\$540,781,367); animal products, \$708,220,447 (\$546,336,264); textiles and textile products \$666,438,530 (\$547,451,110). textile products, \$666,438,539 (\$547,451,110); nonmetallic minerals, \$324,289,898 (\$255,624,-328); chemicals and allied products, \$304,400,569 (\$193,890,338). These statistics reflect the great expansion of war production, which continued at an increased tempo in 1942 and 1943 (see *History* 

Output of newsprint in 1942 was 3,257,180 tons; wood pulp, 5,600,000 tons; electric power, 87,110,-000,000 kilowatt-hours (33,318,000,000 in 1941); cement, 9,126,041 bbl. (8,368,711 in 1941); pigiron, 1,975,014 short tons (1,528,053 in 1941); steel ingots and castings (excluding ferro-alloys), 3,121,361 short tons; passenger automobiles for sale in Canada, about 8,300 in 1942 (81,700 in 1941 and 94,633 in 1940). The value of orders held by aircraft factories in 1943 exceeded that of any other industry; shipbuilding, in which the number of men employed increased from 1,500 in mid-1939 to 89,043 on Sept. 1, 1943, ranked second in the total value of orders. Indices showing the average number of persons employed in manufacturing (Base: 1926 = 100) were 112.3 for 1939, 131.3 for

1940, 168.4 for 1941, 206.5 for 1942, and 231.3 at Oct. 1, 1943. See *History*.

Mining. The value of mineral production rose from the record level of \$560,241,290 in 1941 to \$566,768,672 in 1942. Gold production was 4,841,306 fine oz. valued at \$186,390,281; silver, 20,695,-101 oz., \$8,726,296; coal, 18,865,030 short tons, \$62,897,581; natural gas, 45,697,359 M cu. ft., \$13,301,655; crude petroleum, 10,364,796 bbl., \$15,968,851; cement, 9,126,041 bbl., \$14,365,237. Statistics on production of vital war minerals were withheld for military reasons. However the combined value of copper, nickel, lead, and zinc production was \$167,426,611 in 1942; of asbestos, fluorspar, graphite, magnesitic dolomite, mica, sulfur, and strontium minerals, \$26,365,058; of precious metals other than gold and silver, \$19,177,-

Forest Products. The total value of primary forest products in 1941 was \$213,163,089 (\$194,567,875 in 1940). Lumber production in 1941 was 4,941,-084 M ft. board measure, worth \$129,287,703; total sawmill products, \$163,412,292; pulp and paper products, \$334,429,175. See Paper and Pulp.

Fisheries. The yield of all fisheries was valued at

\$75,040,919 in 1942 and \$62,258,997 in 1941. The catch of sea fisheries amounted to \$65,933,167 in 1942 (\$54,325,858 in 1941). Of the 1942 production, salmon accounted for \$22,926,861; herring, \$10,886,522; cod, \$9,962,312; lobster, \$5,084,558. Tourist Trade. The estimated expenditures of U.S.

tourists in Canada were \$79,000,000 in 1942 (\$107,000,000 in 1941). Visitors from other countries spent \$2,900,000 in 1942 and \$4,000,000 in 1941. Canadian visitors to the United States spent \$24,400,000 in 1942 (\$18,300,000 in 1941).

Foreign Trade. A record level was reached in 1942. Total imports rose to \$1,644,241,933 (\$1,448,791,650 in 1941); total exports to \$2,385,466,046 (\$1,640,454,541 in 1941). Exports of domestic produce in 1942 were \$2,363,773,296 (\$1,621,003,175 in 1941). Of the 1942 imports, \$1,304,680,000 came from the United States (\$1,004,498,000 in 1941) and \$273,777,000 from the Brit-

ish Empire (\$359,942,000 in 1941).

Exports to the United States were \$885,523,000 in 1942 (\$599,713,000 in 1941); to the United Kingdom, \$741,717,000 (\$658,228,000 in 1941); Egypt, \$213,128,000 (\$79,195,000 in 1941); British India and Burma, \$168,318,000 (\$40,750,000 in 1941); Australia, \$78,866,000 (\$37,290,000 in 1941); Newfoundland, \$50,832,000 (\$31,873,000 in 1941); Russia, \$36,603,000 (\$5,331,000 in 1941); New Zealand, \$30,336,000 (\$9,981,000 in 1941); British South Africa, \$27,543,000 (\$36,005,000 in 1941); British South Africa, \$27,543,000 (\$36,005,000 in 1941); British South Africa, \$27,543,000 (\$36,005,000 in 1941); Leading export items in 1942 were: Automobiles, \$194,311,611 (\$128,760,269 in 1941); newsprint, \$141,065,618 (\$154,356,543); wheat, \$121,817,692 (\$161,856,075); meats, \$110,428,586 (\$84,177,848); wood-pulp, \$95,266,873 (\$85,897,736); planks and boards, \$80,115,443 (\$74,205,325); automobile parts, \$62,960,913 (\$20,239,344); fish, \$47,928,971 (\$39,512,299). See Trade, Foreign.

Finance. Budget operations of the Dominion Government for the fiscal years 1938–39 to 1943–44 are shown in the accompanying table.

# DOMINION FINANCES [Thousands of Canadian dollars]

 $<sup>^{\</sup>rm e}$  Excluding special financing for exports to the United Kingdom, amounting to about \$300,000,000 in 1940–41, \$900,000,000 in 1941–42, \$1,050,000,000 in 1942–43, and \$1,000,000,000 in 1943–44.

Estimates.

According to the Minister of Finance, direct war expenditure amounted to \$6,012,775,500 from Sept. 3, 1939, to Mar. 31, 1943. The gross public debt of the Dominion rose from \$3,638,320,816 on Mar. 31, 1939, to \$9,228,252,012 on Mar. 31, 1943; the net debt was \$2,152,559,314 and \$6,182,849,101 respectively. The Canadian dollar (used in statistics throughout this article) exchanged on the free market at an average of U.S. \$0.8514 in 1940, \$0.8735 in 1941, \$0.884 in 1942, and \$0.894 in October, 1943. The official exchange rate remained at U.S. \$0.9091.

Shipping. The merchant marine in 1940 numbered 8,396 vessels of 1,292,692 registered tons. War-time restrictions preclude the publication of figures for registered shipping since 1940. Production of the shipyards increased from 1,200 tons of merchant shipping in 1938 to about 900,000 in 1942. In September, 1943, Canada launched her 620th war-time ship. Sea-going shipping entering Canadian ports during the calendar year 1942 aggregated 25,640,763 registered tons (31,452,400 in 1941); coastwise shipping entered, 43,990,764 tons (48,111,082 in 1941). Statistics of ship clearances were withheld. See Shipbulling Shipping.

Railways, etc. With 42,339 miles of line in operation, the steam railways in 1942 carried 47,596,602 passengers and 134,674,537 tons of freight (29,779,241 passengers and 116,808,091 tons of freight in 1941). Railway earnings aggregated \$663,610,590 and expenses \$485,783,584 in 1942. The government-owned Canadian National Railways, which had 23,494 miles of single-track line in 1942, reported a surplus on 1942 operations of \$25,063,268. Highways in 1941 extended 561,489 miles, of which 120,971 miles were surfaced and 204,646 miles of improved earth. See Alaska Highways for Alaska-Canada road built in 1942.

Commercial air traffic statistics for 1942, with 1941 figures in parentheses, were: Revenue miles flown, 12,781,318 (11,800,661); revenue passengers, 214,691 (193,097); revenue freight, 11,434,570 lb. (14,804,681); mail, 5,258,071 lb. (3,388,634). In 1943 Canada ranked next to the Soviet Union in the volume of nonmilitary air freight moved. The transatlantic air-mail service from Canada to Britain via Newfoundland and Eire was resumed in the autumn of 1942. See RAPID TRANS-

IT; ROADS AND STREETS; TUNNELS.

Government. Executive power is exercised in the King's name by the Governor-General of Canada, acting through a responsible ministry. Legislative power rests in a parliament of two houses—a Senate of 96 members appointed for life by the Governor-General on advice of the Cabinet and a House of Commons of 245 members elected for five years (unless the government is sooner dissolved) by popular male and female suffrage. The nine Provinces enjoy a large measure of local autonomy, there being a separate parliament and administration for each. A lieutenant-governor appointed by the Governor-General-in-Council heads each provincial executive. Governor-General in 1943, the Earl of Athlone (installed June 21, 1940).

The Liberal Government sworn in Oct. 23, 1935. was constituted as follows, in order of precedence, on Jan. 4, 1943: William Lyon Mackenzie King, Prime Minister, President of the Privy Council, Secretary of State for External Affairs; Thomas Alexander Crerar, Minister of Mines and Resources; James H. King, Minister without Portfolio; James Layton Ralston, National Defense; Ian Alistair Mackenzie, Pensions and National Health; Charles Gavan Power, Associate Minister of National Defense and Minister of National Defense for Air; James Lorimer Ilsley, Finance; Joseph Enoil Michaud, Transport; Clarence Decatur Howe, Munitions and Supply; James Garfield Gardiner, Agriculture; Norman Alexander McLarty, Secretary of State; James Angus MacKinnon, Trade and Commerce; William Pate Mulock, Postmaster General; Colin William George Gibson, National Revenue; Angus Lewis Macdonald, Minister of National Defense for Naval Services; Louis Stephen St. Laurent, Minister of Justice and Attorney General; Humphrey Mitchell, Labor; Alphonse Fournier, Public Works; Ernest Bertrand, Fisheries; Leo R. LaFleche, National War Services. For Canada's war declarations, see table under World War.

# HISTORY

The Fighting Fronts. Throughout the year Canada, which had forces stationed in Britain almost from the beginning of the war, anticipated more extensive action on the fighting fronts. The participation of Canadian troops in the successful Sicilian campaign in July and August was therefore a source of peculiar gratification at home. Canadian troops cooperated in the reoccupation of Kiska which was announced late in August, and Canadian

forces were responsible for the taking of Ortona, on the road to Rome, in December. Early in the year it was reported by Air Marshal Harold Edwards, commander-in-chief of the Royal Canadian Air Force, that 25 per cent of the flying strength of the Royal Air Force was then composed of Canadians. In December it was announced that Lt.-Gen. Kenneth Stuart would succeed Lt.-Gen. A. G. L. McNaughton, who retired as Canadian army commander because of ill health.

Losses inflicted on Canadian shipping by Ger-

Losses inflicted on Canadian shipping by German submarines decreased in comparison with those of the preceding year, although in the early weeks of 1943 they were still heavy. By the middle of March Navy Minister Angus Macdonald was able to report to the House of Commons that only 3 out of every 1,000 tons of shipping moving through the Gulf of St. Lawrence had been sunk. Canada's losses in the Sicilian victory were 385 killed, 1,200 wounded, and 310 missing, figures which were considered moderate in view of the number of Canadians engaged in that battle. In December it was announced that the casualties in the R.C.A.F. since the start of the war were 10,025, of whom the known dead were 3,654; presumed dead, 3,249; missing, 2,068; prisoners of war, 1,039; interned in neutral countries, 15.

The Armed Services. It was announced in September that Canada's home defense army was to be substantially reduced by the disbanding of two divisions and the substitution of smaller formations. In a subsequent statement clarifying the announcement the Department of National Defense stated that the territorial defense establishment of Canada was to be revised in the light of the overall military situation, but that there was to be no modification of the existing law obliging all men of military age and fitness to serve, and no reduction in the call for volunteers for overseas service, which was set at 100,000 a year. It was estimated that 20,000 men of the lowest medical categories would be made available for essential civilian service.

The issue of conscription for overseas service remained complicated by opposition from the province of Quebec (see 1943 Year Book, pp. 111, 112). Although the bill permitting conscription for overseas service became law in July, 1942, its provisions were not invoked, in accordance with the assurance given by Prime Minister W. L. Mackenzie King at that time that conscription would be resorted to only in case of imperative necessity and with the approval of the Cabinet. Nevertheless the issue remained alive in the province of Quebec. On March 18 the Quebec legislature adopted a motion urging the Federal Government not to impose conscription for overseas service. On February 25, however, only 9 of the 65 Quebec Liberals in the Dominion House of Commons followed their leader, P. J. A. Cardin, when he offered a motion asking for the suspension of the existing draft laws until the manpower situation had been examined by a parliamentary committee.

Labor Minister Humphrey Mitchell announced

Labor Minister Humphrey Mitchell announced on August 14 the call to military training of married men aged 27 to 30 and of all men who reached the age of 18 in 1943. The relevant order-in-council covered all men not heretofore designated or already under arms, and whatever their marital status, who were born in any of the years 1913 to 1916 inclusive. Similarly, the call applied to men born in 1925, except that none of these would be served with orders-medical until he reached the age of 18 years and 6 months. In March it was announced that aliens of military age, including Americans resident in Canada, were to be called

up for military service. Such draftees were to have the option of serving in their own national forces or in the Canadian forces, and the Labor Minister recommended that they consult their national consuls before deciding. Enemy aliens were not included in the order.

The employment of drafted men in the lower medical categories on railway development and maintenance was authorized by the Canadian Government in November. The men thus called would remain under military law and discipline, and would be entitled to a military pension in case of sickness or injury suffered in the course of their work. The men would remain on army pay and allowances, but at the end of their service they would be entitled to any excess amount due them if the amount of charges due for their work exceeded what they had received. The Ministers of Labor and Defense were authorized to make the financial arrangements relating to the charges made for their services.

The decline in the effectiveness of Nazi fighter planes had the result, by the end of the year, of the concentration by many Canadian air training centers on training bomber navigators, bombardiers, wireless operators, gunners, and pilots. Air Minister C. G. Power, in commenting in December on this change, said that while a steady supply of fighter pilots would continue to be trained, even greater attention would be given to developing bomber crews. This would involve a considerable reshuffling of training schools. A substantial number of British instructors and ground crews, released from their work in Canada, were scheduled to return to Britain to be used in the increased operational work there. The supply of ground crew men available in Canada had become so large that men who applied for enlistment might find themselves in the army instead. The original Empire air training plan called for a ground crew personnel of 35,000. This number was doubled and then again increased, but henceforth preference was to be given to men found unfit for service overseas. In addition to approximately 250,000 men in the air force and in the navy, Canada had at this time an army force of about 440,000, about two-fifths of whom were overseas. Also see Naval Progress.

War Production. The year was one of unprecedented economic activity and the productive capacity of the Dominion was double that of the prewar period. In spite of some late indications of tapering off, after Canada had attained in the middle of the year what was believed to be its maximum output, the official index of business for the first 10 months of 1943 was 17 per cent higher than that for the corresponding period in 1942. By the middle of the year Canada was launching each week six or more escort, cargo, or patrol vessels, according to a report given in the House of Commons by Munitions Minister C. D. Howe. In addition, the Dominion was producing weekly 4,000 motor vehicles, 450 fighting vehicles, 940 heavy guns or mountings, 13,000 smaller weapons, 525,000 rounds of heavy ammunition, 25,000,000 rounds of small arms ammunition, and 10,000 tons of chemicals and explosives.

It was estimated that at the close of 1943 Canada had contributed to the war strength of the United Nations 750 ships, 10,000 aircraft, 35,000 armored fighting vehicles, 600,000 other military vehicles, 100,000 guns, barrels and mountings, and 100,000 small arms. Canadian manufacture also included 1,000,000 tons of explosives, 60,000,000 rounds of heavy ammunition, 3,000,000,000 rounds of small arms ammunition, and instruments and

communications material valued at nearly \$300,-000,000. About 30 per cent of Canadian production went to Canadian forces at home and abroad, about 50 per cent to Britain and Russia, and the remaining 20 per cent to the United States, China, and the Pacific theater.

Manpower Mobilization. The rapid pace of production necessarily involved a shortage of manpower. The steps necessary to install a modified form of compulsory national service were taken in 1942 (see 1943 Year Book, p. 113) and in 1943 it was necessary to make use of these powers in order to find labor for essential industry. In May, in two successive orders, the Minister of Labor announced lists of occupations, the workers in which were made liable to transfer to occupations directly connected with the war program. The first of these orders, issued on May 4, applied to men in age and marital classes designated as callable for military training under National Selective Service Mobilization Regulations who were in certain specified nonessential employments. These men were required to report to an employment or selective service office no later than May 19 and the responsibility was put on employers as well as employees. A further order of May 15 was made applicable to single men and childless widowers aged 19 to 40 and to married men from 19 to 25 years of age, engaged in further specified types of employment. In this instance the men were re-quired to report not later than June 15.

In June it became necessary to broaden the age brackets for compulsory transfers. Minister of La-bor Humphrey Mitchell told the House of Commons that in view of the fuel wood shortage and the pressing needs in the fishing and fish-packing industries, youths from 16 years up to military age and men up to 65 would become subject to compulsory transfer orders. By the middle of November compulsory transfer orders had affected the occupations of 14,810 men who had been moved from less essential to more essential work, and 20,000

other cases were under consideration.

On June 23, when the broadening of the age brackets for compulsory transfer was announced in the House of Commons by Labor Minister Humphrey Mitchell, the Labor Minister presented figures for the working population of Canada. At that time, out of 8,720,000 persons in Canada aged 14 or over, 5,100,000 were in the armed services or employed at paid work. As the figure for those at work did not include housewives, it is evident that the number of persons in Canada who were not in useful occupations was very small. Seventy per cent of the males over 14 were in war plants, agriculture, railroading, or other essential civilian occupations. During the year the number of women at work increased rapidly, especially in the western part of the country. By October 1 there were 510,-715 women workers in Canadian industry and allied occupations, approximately 70,000 more than on the corresponding date in 1942, forming 26.2 per cent of the 1,950,131 persons employed in industry at that time.

On May 18 new selective service regulations aimed at eliminating former coal miners from other employment and putting them back into the production of coal were announced in the House of Commons by Labor Minister Humphrey Mitchell. The order-in-council providing for these transfers, which came one day after the Government's declaration of a state of national emergency in coal production, provided that any employee in any industry who had coal mining experience must report that fact to his employer by May 25, and

that the employers must report details on employees who were former coal miners to a selective service officer by June 1. Selective service officers were authorized to require the former miners to report for interviews and to accept work at the coal mines.

Industrial Disputes. Canada was seriously plagued in 1943 by strikes in steel and other essential or important industries. Early in August approximately 20,000 workers in Montreal's three largest aircraft plants went on strike to enforce demands for a retroactive cost-of-living bonus. On August 16 the striking aircraft workers returned to work under the same conditions as when they left. A strike of Montreal police, fire, and public works department employees began on December 14. The strike ended after 11 hours, at the request of the provincial Covernment of Quebec that the Quebec Municipal Commission accept the majority report of an arbitration board involving recognition of the Canadian Congress of Labor as the sole bargaining agent for the striking groups. On December 21 municipal white-collar workers of the city of Montreal began a strike for wage increases. Union officials estimated the prevailing average salaries of whitecollar workers at \$1,020 annually for single per-

sons and \$1,200 for married persons.

Price and Wage Control. The Dominion Government attempted to maintain throughout the year the control of prices and wages set up in 1941 see 1942 Year Book, p. 100) and successful in 1942, but by autumn it was apparent that the wagecontrol aspect of the system was not fully effective. Prices, on the other hand, were well under control. In the two years following the introduction of the system there was a price increase of only about 4 per cent. Between Nov. 1 and Dec. 1, 1943, the official cost-of-living index declined fractionally. Wages, which were intended to be held with prices by fitting a cost-of-living wage bonus to any changes in the official index, in practice were in many instances increased under decisions of the War Labor Boards. In a radio address on December 4 Prime Minister W. L. Mackenzie King told his countrymen that in the past two years the War Labor Boards had dealt with 40,000 applications for wage adjustments affecting 2,500,000 workers, and had granted increases amounting in all to more than \$150,000,000. The Government was therefore to issue a revised wage control order and at the same time a code of labor relations for war industries.

Under the new order, "Wartime Wages Control Order, 1943," which was made public on December 9, cost-of-living wage bonuses were scheduled to be merged with wage rates as of Feb. 15, 1944, and no further increases in wages would be made except for the purpose of removing gross inequalities and injustices. If the cost of living should rise more than 3 per cent and remain at that level for two consecutive months the Government would, however, review the whole program of price and wage control and take appropriate action. Government, Dominion, provincial, and municipal employees were excepted from the order and would continue to receive the cost-of-living bonus. The National War Labor Board, under the chairman-ship of Mr. Justice C. P. McTague, which had re-cently conducted an inquiry into the whole field of industrial relations, would now consist of six members instead of three and would exercise control over regional boards and review their findings.

In the meantime further increases in prices and wages were made in the eastern coal district. On December 6 the National War Labor Board, with expressed reluctance, granted an increase of \$1 a

day in the wages of eastern coal miners, remarking that this decision, which applied to the miners of Nova Scotia who brought forward their case in the way lawfully provided, was forced by the recent success of the western coal miners who won wage increases by striking. On December 15 Finance Minister J. L. Ilsley announced a government decision to increase the price of coal produced in the Nova Scotia coal mines, in line with a recent increase in coal prices for Alberta and British Columbia.

Financial Policy. In the Federal budget for 1943-44 presented to Parliament by Finance Minister Ilsley on March 2 (see *Finance* above) there was no major change in the basic structure of the income tax except for the lowering of rates slightly above the exemption levels. In this budget the transformation to a pay-as-you-earn system was completed and it was expected that 95 per cent of income tax, instead of 90 per cent as formerly, would now be collected at the source. There were no changes in the sales tax or the succession duties and only minor alterations in the excess profits tax. The customs tariff was slightly reduced except for liquor, but several excises were raised. In the same period financial provision was made for a second gift of \$1,000,000,000 in war supplies (see 1943 YEAR BOOK, p. 114) to Britain and other members of the United Nations.

In introducing on May 6 the bill providing for the expenditure Finance Minister Ilsley said that the Canadian Government wished to share its war supplies with others, that it did not wish a short-age of Canadian dollars to prevent any allies from obtaining Canadian war materials, and that it wished to avoid the piling up of huge war debts by selling goods for payment after the war or by creating indefinite and uncertain postwar obliga-

Canada floated two large war loans in the course of the year. The Fourth Victory Loan, the largest public bond issue in the history up to that time, offered to the public on April 26, brought in subscriptions of \$1,303,000,000 representing 2,669,111 subscribers. The Fifth Victory Loan, opened on October 18, was set at \$1,200,000,000, but it brought in \$1,383,000,000 from more than 3,000,000 publications. Throughout the year resource ware 000 subscribers. Throughout the year revenues were

buoyant but expenditures grew even more rapidly.

Political Developments. The Canadian Parliament was prorogued on January 27, after a review of events since the session opened on Jan. 22, 1942. One day later a new session, the fourth of the 19th Parliament, was declared open. This session ended on July 24 with an adjournment to Jan. 26, 1944. Except for a two-week recess at Easter the body had been sitting continuously for six months. The House of Commons occupied itself largely with financial matters, production, the cost of living, labor and manpower policy, and postwar plans. Early in March two committees were appointed to make recommendations on the country's postwar problems: a Committee on Reconstruction and Reestablishment and a Committee on Social Security. The latter committee shortly received a report on health insurance by Minister of Pensions Ian Mackenzie and a general social security report, resembling the British Beveridge Report, by Dr. Leonard

C. Marsh.

The Liberal Party continued its efforts to maintain its popularity and prestige but as the dominant party it suffered a number of setbacks. The Conservative Party, reorganized under the title of Progressive Conservative (see 1943 YEAR BOOK, p. 114), the Cooperative Commonwealth Federation

under the leadership of M. J. Coldwell and Quebec's Bloc Populaire continued to show success in getting voters to go to the polls. In four Federal by-elections held on August 9 the Liberals lost and their representation on the House of Commons was thereby reduced from 174 to 170. In Saskatchewan two Cooperative Commonwealth Federation candidates were successful; in Stanstead, Quebec, the election was won by a Bloc Populaire candidate, and in Montreal-Cartier the winner was a Communist running as a Labor-Progressive. Progressive-Conservatives now held 39 seats, Cooperative Commonwealth Federationists 11, Social Crediters 10, and the Bloc Populaire 4.

Coming after the very considerable defeat of the Liberals in the Ontario provincial elections of August 4, these results suggested that a general election might not be far away. The preceding general election was held in May, 1940. On September 27, however, Prime Minister Mackenzie King gave the National Liberal Federation meeting in Ottawa an assurance that no election would be held in 1944 unless one of the following conditions arose: a decided unwillingness of the people to support the Government's policies, a distortion of the Government's policies by an opposition group, a split in the Government or among its supporters, or an unforeseen event. Progressive Conservative leader John Bracken objected to Mr. Mackenzie King's statement on the ground that the conditions gave the Prime Minister an excuse for calling an election at any time and then putting the responsibility on others.

Cooperative Commonwealth Federation The showed markedly increased vigor in 1943. Although the party's representation in the House of Commons remained small, its national council, meeting in Regina, Sask., on December 30, prophesied that it would play a large part in a dramatic political conflict in Canada in 1944. In a statement issued at that time the council alleged that money was being poured out by the monopolists to popularize a return to the system of free enterprise, "the system with which Canada experimented before the war.

The autonomist movement in the province of Quebec retained its existence but showed little new strength. On March 2 the provincial Legislative Assembly defeated by a vote of 38 to 12 a motion demanding that the government of the province adopt at once all appropriate measures in order that the province might recover and retain its complete autonomy. The death in Vancouver on May 23 of Social Credit Premier William C. Aberhart of the province of Alberta, who had been in office since his party's victory in the provincial elections of 1935, called attention to the failure of Mr. Aberhart's government to implement social credit and to the possibilities of a political upset in Alberta. In a provincial by-election on December 16, however, a Social Credit candidate was elected to the legislature, giving Social Credit 35 seats in the legislative assembly

Relations with United States. In recognition of the growing importance of their relations, Canada and the United States agreed on November 11 to elevate their respective legations in Washington and Ottawa to the rank of embassy. Both military and economic collaboration were greatly extended in the course of the year. On May 21 it was an-nounced that the U.S. Army had established a base at Porpoise Harbor, near Prince Rupert Harbor on the British Columbia coast. The joint economic committees of Canada and the United States

announced on January 24 that their wartime collaboration would extend to the peace-time development of 1,000,000 square miles of Alaska, northern British Columbia and Yukon Territory. On February 1 notes setting forth the general principles covering the postwar disposition of defense projects that the U.S. Government had built or might build in Canada were put on record in the House of Commons. The notes incorporated a recommendation of the Permanent Joint Board on Defense, adopted on January 13, which suggested that all immovable defense installations should be, unless otherwise agreed by the two governments, relinquished in the right of Canada or offered for sale to the Government of Canada or in the open market subject to the approval of both governments.

Beginning at the end of January, publicity was given to the great Shipshaw power and aluminum project in Quebec, financed by the Aluminum Company of Canada out of contracts for sales of aluminum to the United States. The financing by the United States continued to receive critical attention especially when, at the end of the year, American authorities closed certain American aluminum plants while the Canadian contract remained operative.

The project of widest public interest, known as "Canol," was the American development at the request of the U.S. Army of oil wells and pipelines in the region of Fort Norman, Northwest Territories, and Whitehorse, Yukon Territory. This project, which was connected with the Alaska Military Highway and with "Catel," a telegraph and wireless system covering all the projects, was initially the projects, was initiated in June, 1942, when danger of further Japanese aggression seemed great, but it was not widely discussed by the public until November, 1943, when it was criticized by the American Senate's "Truman Committee." The project was not Canadian, but sections of Canadian opinion were put on guard against a possible rewriting of agreements. The position of Canada in respect to the development was set forth in notes exchanged between the two governments in August, 1942, which provided that such undertakings be subject to valuation by a joint international board, with a first option given to the Canadian Government to purchase at an agreed valuation.

Other International Relations. Canada's mutual aid gift of \$1,000,000,000 in war supplies to Britain and other nations reinforced the already cooperative relationship with Britain. Canada was fully cognizant of the significance of the choice of Quebec City for the holding of the Quebec Conference (see United Nations) in August and of the presence of Prime Minister Winston Churchill. At the end of the Quebec Conference the Canadian Government issued a statement welcoming the establishment of the French Committee of National Liberation and recognizing it as administering the French overseas territories which acknowledged its authority. Prime Minister Mackenzie King told the House of Commons on May 11 that henceforward Canada would send war supplies directly to Russia, instead of through the United States or Britain as previously. In August the Turkish Ministry of Foreign Affairs decided to create an embassy in Canada, and in December Canada raised the rank of its legations in the So-

viet Union, China, and Brazil to that of embassies. See Alaska, Creat Britain, and Japan under History; Banks and Banking; Chemistry under Foreign; Dams; French Literature; Immigra-TION; JOINT ECONOMIC COMMITTEES; JOINT WAR PRODUCTION COMMITTEE; LABOR CONDITIONS; Mu-SIC; SOCIALISM; WORLD WAR.

ALZADA COMSTOCK.

CANADA, The United Church of. The designation applied to the single body formed by the union in 1925 of the Congregational, Methodist, and Presbyterian churches in Canada; the Methodist churches of Newfoundland and Bermuda are also included. In the year of 1942 there were in Canada, Newfoundland, and Bermuda 7,042 preaching places (including home missions) in 2,771 pastoral charges, 721,184 communicant members, and 1,713,186 persons under pastoral care. A total amount of \$12,250,863 was raised for all purposes. At the Tenth General Council held in Belleville, Ont., in September, 1942, the Rev. J. R. P. Sclater, M.A., D.D., was chosen moderator for the ensuing biennium. Rev. Gordon A. Sisco, M.A., D.D., is general secretary. Headquarters: 421 Wesley Building, Toronto, Ont.

CANADIAN COOPERATIVE FEDERATION. See SOCIAL-ISM.

CANALS. See AQUEDUCTS; PANAMA CANAL ZONE; SUEZ CANAL; WATERWAYS.

CANARY ISLANDS. An archipelago off the coast of northwest Africa. Administratively they form two provinces of Spain, and are named after their respective capitals: (1) Las Palmas (comprising the islands of Gran Canaria, Lanzarote, Fuerteventura, and the islets of Alegranza, Roque del Este, Roque del Oeste, Graciosa, Montafia Clara, and Lobos), area, 1,279 square miles; population (Jan. 1, 1941), 322,332; capital, Las Palmas (119,595 inhabitants) on Gran Canaria. (2) Santa Cruz de Tenerife (comprising the islands of Tenerife, Palma, Gomera, and Hierro), area, 1,528 square miles; population (Jan. 1, 1941), 365,605; capital, Santa Cruz de Tenerife (72,358 inhabitants). Las Palmas is normally an important shipping and tourist center. Coffee-growing is the chief industry. Corn, millet, sugar cane, manioc, fruits, vegetables, tobacco, cotton, indigo, and castor oil are produced. Exports of fish and fish products totaled 28,646 metric tons in 1942.

CANNING. See FOOD INDUSTRY; TIN. CANOL. See ALASKA, CANADA, and YUKON under History. CANTEEN CORPS. See RED CROSS.

CANTON ISLAND. An atoll of the Phoenix group in the central Pacific which with Enderbury Island of the same group is under the joint control of Great Britain and the United States (Anglo-U.S.A. Pact of Aug. 10, 1938 and Notes of Apr. 6, 1939). Canton is 29 miles in circumference and has a land mass of from 50 to 600 yards wide which encloses a lagoon 9 miles in diameter. Enderbury is 2.5 miles long and 1 mile wide. Canton was a port of call on Pan American Airways' transpacific air service from Honolulu to Auckland, New Zealand, which commenced on July 12, 1940. Besides a complete seaplane base, the facilities installed at Canton after it was occupied in 1938 included a 24-room hotel and other conveniences for passengers. A landplane runway was constructed in 1941. These facilities were shelled by Japanese warships in December, 1941, but damage was reported to be slight. Early in 1942 United States armed forces were stationed on the island, which became an important link in the air transport route to the battle fronts of the southwestern Pacific and a base for air patrol operations.

CARIBBEAN COMMISSION, Anglo-American. A Commission created Mar. 9, 1942, by the British and U.S. Governments to strengthen social and economic cooperation between the United States, the United Kingdom, and territories under the British and United States flags in the Caribbean area, and to avoid unnecessary duplication of research. The six-member Commission serves in an advisory capacity to the two governments and is concerned primarily with labor, agriculture, housing, health, education, social welfare, finance, economics, and related subjects. The U.S. Section became an integral unit of the Department of State (q.v.) on Dec. 14, 1942. See BRITISH WEST INDIES and JA-MAICA under History.

CARIBBEAN DEFENSE COMMAND, U.S. See NICARAGUA under History.

CARNEGIE ENDOWMENTS. Carnegie Corporation of New York. Established by Andrew Carnegie in 1911, this corporation was formed for the advancement and diffusion of knowledge and understanding among the people of the United States and the British Dominions and Colonies. Its total endowment is approximately \$135,000,000, of which \$10,-000,000 is applicable in the British Dominions and Colonies.

During the year ended Sept. 30, 1943, the Corporation appropriated \$2,562,900 for library interests, adult education, fine arts, research, study, and publication, and various purposes of colleges and universities. Some \$490,000 was devoted to activities connected directly with the war effort, thus making a total of more than \$1,650,000 granted for such purposes during 1940-43.

The trustees of the Corporation as of Oct. 15, 1943, were: Thomas S. Arbuthnot, W. Randolph Burgess, Vannevar Bush, Nicholas Murray Butler, Henry James, Walter A. Jessup, Nicholas Kelley, Russell Leffingwell, Margaret Carnegie Miller, Frederick Osborn, Arthur W. Page, and Elihu Root, Jr. Officers of administration were: Walter A. Jessup, president; Robert M. Lester, secretary; and C. Herbert Lee, treasurer. Office: 522 Fifth Avenue, New York City.

Carnegie Endowment for International Peace. Founded by Andrew Carnegie in 1910, the endowment consists of a trust fund of \$10,000,000, the revenue of which is to be administered to hasten the abolition of international war. The work is carried on in three Divisions: (1) Division of Intercourse and Education; (2) Division of International Law; (3) Division of Economics and History.

A special library containing 70,000 volumes on all aspects of public international relations is maintained in Washington. During the fiscal year ended June 30, 1943, the Endowment's income amounted to \$497,875, which included grants of \$75,000 from the Carnegie Corporation of New York. During this period, the Endowment expended \$468,-215. The officers are: President, Nicholas Murray Butler; Vice-President, John W. Davis; Secretary, George A. Finch; Treasurer, Roland S. Morris. Administrative offices are at 700 Jackson Place, Washington, D.C. Divisional offices are at 405 W. 117 St. New York City. 117 St., New York City.

Carnegie Foundation for the Advancement of Teaching, The. A foundation established in 1905 by Andrew Carnegie, who gave an endowment of \$10,-000,000 for paying retiring allowances and widows pensions in the United States, Canada, and Newfoundland and for various other purposes in the field of higher education. Incorporated by Act of Congress in 1906, the Foundation received a further gift of \$5,000,000 from Mr. Carnegie and appropriations totaling \$13,250,000 for endowment and reserves from Carnegie Corporation of New York. On June 30, 1943, its resources amounted to \$18,402,445. In 1942–43, it disbursed \$1,931,238 for allowances and pensions. It awards no scholarships or aids of any kind. The Foundation's Annual Reports and Bulletins deal with many phases of higher education. In 1943 its principal studies concerned the educational appraisal of individuals through new-type tests and testing, particularly at the graduate level. Dr. Walter A. Jessup is president, and Howard J. Savage, secretary and treasurer, with offices at 522 Fifth Avenue, New York City.

Carnegie Hero Fund. A Fund established in 1904 by Andrew Carnegie to help those who have risked their lives to an extraordinary degree to save human life or to aid dependents of rescuers who have lost their lives in the performance of their acts. The original endowment was \$5,000,000; the amount expended to Sept. 30, 1943, was \$6,419,473. Dr. Thomas S. Arbuthnot is President and Mr. C. B. Ebersol is Assistant Secretary and Mandan of the First Island St. 1941. ager of the Fund, the address of which is 2307 Oliver Building, Pittsburgh, Pa

Carnegie Institute, located in Schenley Park, Pittsburgh, Pa., founded and endowed by Andrew Carnegie in 1896, comprises the Department of Fine Arts, the Carnegie Museum, and the Carnegie Music Hall. For activities, see YEAR BOOK for 1940. Thirty-six prominent citizens of Pittsburgh consti-tute the Board of Trustees. The officers are as follows: Samuel Harden Church, President; William Frew, Vice-President; Augustus K. Óliver, Secretary; Richard K. Mellon, Treasurer.

Carnegie Institution of Washington. An organization founded in 1902 by Andrew Carnegie "to encourage in the broadest and most liberal manner investigation, research, and discovery, and the application of knowledge to the improvement of mankind." Income on investments for the year 1943 amounted approximately to \$1,150,000.

Organization of the normal research program of the Institution remains much as described in YEAR Book for 1941. Due to present war emergency, however, the entire resources of the Institution including laboratory facilities and personnel have been made available to the U.S. Government, and most of the Institution's long-time projects have been temporarily deferred in lieu of war research contracts with the Government. The President of the Institution is the Director of the Government's Office of Scientific Research and Development.

W. Cameron Forbes is Chairman of the Board of Trustees of the Institution, and Vannevar Bush is President. Other Trustees are: Thomas Barbour, James F. Bell, Robert Woods Bliss, Lindsay Brad-James F. Bell, Robert Woods Bliss, Lindsay Bradford, Frederic A. Delano, Homer L. Ferguson, Walter S. Gifford, Herbert Hoover, Walter A. Jessup, Frank B. Jewett, Alfred L. Loomis, Roswell Miller, Henry S. Morgan, Seeley G. Mudd, John J. Pershing, Henning W. Prentis, Jr., Elihu Root, Jr., Henry R. Shepley, Richard P. Strong, Charles P. Taft, James W. Wadsworth, Frederic C. Walcott, and Lewis H. Weed. CATHOLIC CHURCH IN THE UNITED STATES. The Official Catholic Directory for 1943 lists a total Catholic population for the United States, Alaska, and Hawaiian Islands of 22,945,247, an increase of 389,005 over 1942. One new diocese, Youngstown, Okio was attalked at the state of the stat Ohio, was established last year, bringing the total number of dioceses to 96; archdioceses number 20. At the annual meeting of the Archbishops and Bishops in November at the Catholic University of America, reports by the heads of the various departments of the National Catholic Welfare Conference summarized the activities of the Church during the year past.

The Most Rev. Edward Mooney, Archbishop of Detroit, Chairman of the Administrative Board of the National Catholic Welfare Conference, reported that "it is to be expected that Government program and policies will have an important effect on the social and educational agencies of the Church." Problems arising out of new tax proposals, out of the application of Selective Service, and out of decisions of War Manpower boards regarding workers in educational, religious, and charitable institutions, were some of those referred to by Archbishop Mooney. He pointed out the importance of the work of War Relief Services, N.C.W.C., during the past year; that "the contributions made by our Catholic people to the Bishops' War Emergency and Relief work have received the commendation and appreciation of the . Holy Father"; that the plans were successfully put into effect for the publication in this country of Acta Apostolicae Sedis, official publication of the

Holy See.
"The situation of the American family, certainly very grave before the war, has grown worse since its outbreak," Archbishop Mooney told the meeting. He reported on the work of the N.C.W.C. Family Life Bureau, supported by the various national committees of the National Council of Catholic Women, to give local and national publicity to Catholic teachings on the family. The Administrative Board has presented to Government authorities "its grave concern on reported procedures in service camps and stations for prevention of venereal disease," and assurances have been given that the "consciences of our men will be respected."

The Church in the United States shared the

bitter grief of the Catholic world that the City and Diocese of the Holy Father had finally to endure the fury of aerial warfare. Repeated expressions of grave concern and regret will aid in saving the Eternal City from the disaster threat-

ening it.

Throughout the year the Department of Education has been occupied mainly with problems that arise directly or indirectly out of the war and its impact on the Catholic schools, the Most Rev. John T. McNicholas, O.P., Archbishop of Cincinnati and Episcopal Chairman of that Department, reported. The department has been closely following the activities of the various groups that are interesting themselves in the problems that will face education in the postwar world. "The condition of the time," the report continued, "was reflected in an increased demand for boarding schools for young children, nursery schools, and vocational schools. The employment of mothers and disrupted home life are causing more parents to send young children to boarding schools and increasing the need for the care and instruction of pre-school children." Other chapters in the report are devoted to the activities of the Inter-American Collaboration Section, the Teachers' Registration Section, Library Service, and Special Publications.

During the past year, the N.C.W.C. Press Department so strengthened its coverage of Vatican news as to become the only source of complete information on Vatican wartime thought and activity, the Most Rev. John Mark Gannon, Bishop of Erie and Episcopal Chairman of the Department, reported. Through Vatican sources, also, much ma-terial was obtained concerning the occupied countries of Europe. This news of vital interest was transmitted by means of the Department's Spanishlanguage service, Noticias Catolicas, to the countries of Latin America. The News Service registered an increase of 21 subscribers during the

year, bringing the total to 204 in 32 lands.
The Most Rev. John F. Noll, Bishop of Fort
Wayne and Episcopal Chairman of the Department of Lay Organizations, reported that the headquarters of the National Council of Catholic Women continues to serve as a training center for women leaders in Catholic Action, as a clearinghouse and publicity medium for programs of women's organizations, as a source of representation of Catholic women's interests in secular and governmental groups, as a liaison between Catholic women in the United States and the International Union of Catholic Women's Leagues, and as sponsor of the National Catholic School of Social Service. An important service provided to affiliated organizations is a monthly release on proposed and existing legislation.

The National Council of Catholic Men was authorized to cooperate in the work of the National Organization for Decent Literature, by centralizing in its office reports from reviewers, compiling therefrom and periodically revising the list of pub-lications not approved because of failure to conform to the N.O.D.L. Code, conducting negotiations with publishers concerning inclusion of their publications on the list or removal therefrom, and reporting its conclusions and recommendations to the Chairman of the Episcopal Committee on Obscene Literature. The list of Magazines Disapproved by the N.O.D.L. was revised, the number of such magazines (up to June 30, 1943) being 54.

The Narberth Movement, a plan designed for the diffusion of information about Catholic faith and practice through the medium of pamphlets and press releases, was formally taken over by the N.C.C.M. at the end of 1942; during the year 52 "Narberth" articles were prepared for the secular press, as well as various other pieces of promotional literature. The year ending March 2, 1943, marked the close of the Catholic Hour's thirteenth year. During the year 89 stations have carried the hour.

The Department of Social Action sent to 700 priests a monthly four-page letter and other material, and prepared a four-year course for semi-narians' study clubs in the field of industrial relations, the Most Rev. Karl J. Alter, Bishop of Toledo and Episcopal Chairman of the Department, stated in his annual report. In the field of industrial relations, four regional two-day industrial conferences were held, and members of the Department served on various governmental committees. In the rural life field, the Department aided in increasing the educational and propaganda activities of the National Catholic Rural Life Conference, which now has 75 Diocesan Directors and two Regional Directors. In the civic field, the Department was active in combating racial discrimination.

The Most Rev. Joseph F. Rummel, Archbishop of New Orleans, Episcopal Chairman of the Legal Department, noted that the condition of crisis occasioned by the war "in a great measure has disappeared." Problems which have arisen in the war-made fields of manpower, critical materials, transportation, taxation, and kindred divisions, occupied much of the attention of the Department members. In cooperation with the Catholic Hospital Association, the Department worked out a project whereby two hospital Sisters from each of the Latin-American republics will be brought to this country for a year of training and study. The Department, in the field of vocational rehabilitation, has contacted officials responsible for the administration of the Federal Vocational Rehabilitation Act in an effort to devise some way in which aid might be extended to those desiring to attend a denominational school.

The Most Rev. John A. Duffy, Bishop of Buffalo and Episcopal Chairman of the N.C.W.C. Youth Department, reported distribution of "grants-inaid," administered by the Youth Department, from a fund of \$50,000 appropriated by the Bishops' War Emergency and Relief Fund to chaplains working with trainees on secular campuses. The appropriation assists chaplains in providing for extra Masses, Confessions, sick calls, religious articles, and literature. At the present time, 102 dioceses out of a total of 115 have Diocesan Youth Directors. Despite adverse circumstances, practi-cally all of the organized dioceses conducted leadership training institutes for adult lay leaders during the year.

One of the outstanding achievements of the college and university section of the National Catholic Youth Council was the Catholic Collegiate Congress on "Victory in War and in Peace," sponsored jointly by the Newman Club Federa-tion and the National Federation of Catholic College Students. The Congress brought together for

the first time 331 delegates from 60 Catholic and 118 delegates from 25 secular colleges and universities. Despite the war, the N.F.C.C.S. added 20 affiliates during the year, bringing the total to 85.

CENSORSHIP, Office of. United States censorship was accepted more fully by officials and the public in the year 1943 as a necessary and valuable part of wartime economy. A comprehensive organization, built up in the first year after Pearl Harbor, sought to improve techniques, attain more efficient administration, and take increasing advantage of the affirmative benefits of the censoring process.

The Office of Censorship, created in December, 1941, retained major responsibility as a war agency with a staff of about 13,000, charged with censoring all mail, cables, and other communications entering or leaving the country. The Office also supervised the voluntary cooperation of the domestic press and radio in withholding secret military in-

Control of the international mails, the largest task physically, involved the problem of examination of about 1,000,000 pieces of mail available daily at Postal Censorship stations. Uniform regulations and schools of instruction for personnel were established. Several classes of mail, including letters to and from prisoners of war, required specialized treatment. Experts in trade, banking, and shipping communications were assembled and a special unit inspected philatelic mail to prevent transmission of illegal funds or of code messages.

Translators handled communications in some 200 languages and dialects and chemists in secret ink laboratories worked closely with intelligence agencies. Units cooperating with the Bureau of Customs scrutinized papers carried by international travelers and all photographic prints and films presented for export or import. The Armed Services, however, conducted the censorship of all mail to and from Army and Navy personnel overseas. International communication by radio, cable,

telegraph, radiotelephone, and land wire was handled by highly expert staffs, including experienced newspapermen, on duty 24 hours a day. Censorship delays were only a few minutes in many instances. One of the few public criticisms of censorship in 1943 was directed against this phase of operations by a number of British correspondents who declared deletions in dispatches from New York to London went beyond security requirements.

On Jan. 30, 1943, separate regulations for postal, cable, and radiotelephone communications were consolidated into the U.S. Censorship Regulations, which, in general, prohibit communication with enemy territory except by special license and state that revealing references to fortifications, ship and troop movements, and secret military plans or weapons will be stricken from communications crossing international boundaries. Copies were made available to the public.

Toward the end of 1942, some members of the U.S. Senate contended there was no legal warrant for censorship of communications between Continental United States and the Territories. Legislation to legalize this censorship was proposed but was dropped when the new Congress met in 1943. Censorship of these communications continued.

Voluntary censorship of press and broadcasting in the United States under supervision of the Office of Censorship continued in 1943 with the support of both industries. On Feb. 1, 1943, various eliminations and additions were made in the revised Code of Wartime Practices for the American Press and its companion Code of Wartime Practices for American Broadcasters. Late in 1943, an improved military situation and other factors prompted additional revision and relaxation permitting more complete weather reports for newspapers and the broadcasting of weather news for the first time in almost two years. Virtually all remaining restrictions on war production information, other than secret models, were eliminated. The way was opened for more publicity regarding the war contributions of merchant shipping.

Both the Press and Broadcasting Divisions of the Office of Censorship, operating with very small staffs and no branch offices, continued on the theory that every editor and broadcaster is his own censor under the Code. The percentage of violations was

small.

The Office of Censorship continued through 1943 as an entirely independent agency responsible only to the President. Congress approved without debate \$27,800,000 for the agency for the fiscal year beginning July 1, 1943. See FREEDOM OF SPEECH.

BYRON PRICE.

CENSUS, Bureau of the. A branch of the U.S. Department of Commerce which serves as the fact-finding agency of the Government. It conducts the decennial census of population, the quinquennial census of agriculture, foreign trade and vital statistics reports, data on local governments, etc. Director in 1943: James C. Capt.

CERAMICS. See WAR PRODUCTION BOARD under Substitution. For Tile, see Building Materials. CEREBRO-SPINAL FEVER. See MEDICINE.

CERTIFICATE OF AVAILABILITY. See WMC.

CEYLON. A British self-governing colony, south of India. Area, 25,332 sq. mi. Population (1942 estimate), 6,000,000, of whom 64 per cent were Singhalese. Vital statistics (1941): 219,864 births, 113,003 deaths. Buddhism is the religion of the greater part of the population. Chief cities: Colombo (capital) 310,000 inhabitants in 1936, Jaffna 46,000, Galle 38,500, Kandy 36,500.

Education. In 1940 there were 4,547 Singhalese and Tamil schools with a total of 781,000 students; 410 English and bilingual schools and 100,000 students. Higher education was given in Colombo at the Royal College, the Government Training College, the Technical College, and the University of Ceylon. There were 90 industrial schools.

Production and Trade. Chief agricultural products: tea (112,000 tons exported in 1940), rubber (150,000 tons, est. output for 1943), coconut products (122,252 tons exported in 1940), rice, cinnamon, cacao, tobacco, and citronella. Livestock (1940): 1,745,777 cattle, 284,207 goats, 62,710 sheep, 39,211 swine, 1,658 horses. Minerals produced include

graphite (23,820 tons in 1940), ilmenite, and monazite. Small-gem quarries produce sapphires, rubies, moonstones, cat's-eyes, and other gems. Trade (1942): imports Rs274,000,000 (textiles, rice, coal and coke, augar, and manures were the main items); exports Rs507,000,000 (in 1942, one rupee equaled \$0.3012, 13.34 rupees equaled £1).

Communications. In 1940 there were 951 miles of railway open to traffic, 18,660 miles of roads, and 10,055 miles of telegraph wire. Shipping (1940):

6,445,409 tons cleared.

Finance. Budget estimates, exclusive of railway revenue and expenditure (financial year to Sept. 30, 1943): revenue £11,133,333; expenditure £12,266,666. Budget estimates for the year ending Sept. 30, 1944, provide for revenue of Rs215,000,000. In 1943 the Government launched a national loan of \$125,000,000 to be used to meet the 1943 defense appropriation, to repay a loan due in 1945–46, and to provide a fund for postwar industrial expansion. Ceylon in 1943 had an oversea credit of Rs167,000,000, as compared with an oversea debt of Rs106,000,000 in 1936.

Government. The Government is administered by a Governor, assisted by a State Council of 61 members (50 elected on a territorial basis, 8 nominated unofficial, and 3 officers of state). This State Council, which deals with administrative as well as legislative matters, is divided into 7 executive committees in charge of various subjects, and the chairmen of these committees are Ministers for the subject concerned. Governor, Sir Andrew Caldecott (appointed Jan. 19, 1937); Commander in Chief, Adm. Sir Geoffrey Layton (appointed Mar. 15, 1942, to control all naval, military, air, and civil authorities).

History. The promise of constitutional reform after the war, given to the Ministers of the Ceylon Government in 1941 by the British Government, was reiterated in more specific form by the British Colonial Secretary in the House of Commons May 26, 1943. His promise of "full responsible Government under the Crown in all matters of internal civil administration was in response to continued agitation for independence or self-government in Ceylon.

The Colonial Secretary said that once victory was won the British Government was prepared "to examine by suitable Commission or Conference such detailed proposals as the (Ceylon) Ministers may in the meantime have been able to formulate in the way of a complete constitutional scheme," subject to the following conditions: (1) Continued control by the British Government of defense, foreign relations, currency, rights and properties of non-resident British subjects, Commonwealth trade and shipping, and measures likely to involve oppression or unfairness to any racial or religious community; (2) approval of the Ceylon Ministers' proposals by three-fourths of all members of the Ceylon State Council, excluding the three appointed Officers of State and the presiding officer.

Active preparations were under way during 1943 to convert Ceylon into one of the two main bases (the other being India) for the reconquest of Burma and British Malaya. Large numbers of British East African native troops were reported in Ceylon in September, along with strong British

air and naval forces.

CHAIN GANGS, Abolition of. See PRISONS.

CHEMICAL INDUSTRY. The year 1943 was one of continued sharp expansion for the chemical industry. Total dollar value of output of chemicals and allied products during 1943 was placed at \$7,500,000,-

000 by the Chemicals Division of the War Production Board. This represented an increase of 102 per cent over 1939 when total production reached \$3,700,000,000. Even allowing for a 15 per cent rise in chemical prices since 1939, the gain in chemical manufacture was very heavy. The percentage increase is even greater if the chemical manufacturing industry is considered by itself. Excluding allied products usually grouped with chemicals, the value of chemical manufacture grew from \$790,000,000 in 1939 to an estimated \$2,-200,000,000 in 1943, a gain of 180 per cent in four years. The following table shows the chemical expansion since 1939, based on official index figures:

#### CHEMICAL SUPPLIES

| (1935-39 = 100)                      | Total<br>Industry<br>Output | Industrial<br>Chemical<br>Output  |
|--------------------------------------|-----------------------------|-----------------------------------|
| 1939<br>1940<br>1941<br>1942<br>1943 | . 130<br>. 176<br>. 278     | 120 -<br>153<br>210<br>286<br>366 |

Behind the over-all totals of this expansion in production lies an interesting picture of expansion in specific chemical products. In the organic chemicals industry, according to War Production Board data, production of coal tar crudes and intermediates rose from \$73,000,000 in 1939 to an estimated \$290,000,000, an advance of 300 per cent. mated \$290,000,000, an advance or 500 per cent. Coal tar finished products advanced from an output of \$106,000,000 in 1939 to \$200,000,000 in 1943, an expansion of 89 per cent. Non-coal tar synthetics production of \$173,000,000 in 1939 advanced to an estimated \$640,000,000 in 1943, a rise of 270 per cent. Non-coal tar other products moved up from \$25,000,000 in 1939 to an estimated \$200,000 000 lest year an advance of 700 mated \$200,000,000 last year, an advance of 700 per cent.

In the inorganic chemicals industry, the production of \$413,000,000 in 1939 advanced to \$880,-000,000 in 1943, an advance of 112 per cent.

The non-coal tar synthetic organic group includes production of butadiene for the synthetic rubber program and methanol and other organic chemicals produced in ordnance plants. The advance in this sector is expected to continue through 1944. The non-coal tar other products classification consists almost entirely of alcohol by fermentation.

The expansion in chemical output in 1943 was due to two factors: the wartime increase in normal industrial markets, and the carrying out of specific wartime programs, such as:

Synthetic rubber which resulted in the spurt in alcohol production, in butadiene, styrene, carbon black, and other raw materials required in the synthetic program;

Military explosives which increased ammonia and toluene manufacture and required substantial new capacity for the production of methanol and sulfuric acid;

Chemical warfare, which made heavy demands for additional chlorine, arsenic, phosphorous, acetic acid, and other chemicals;

Aviation gasoline which called for increased production of chemical additives and lubricating oils, and in benzene, tetrethyl lead, hydrofluoric acid, aluminum chloride, and others

In addition to these, there are the Allied Products Group which include carbon blacks, coated fabrics, chemical cotton pulp, fertilizers, drugs and pharmaceuticals, paints and compressed gases, all of which boosted chemical production.

The wartime production increase of the industry was facilitated through a sharp plant expansion. Manufacturing facilities of the industry during the past four years were increased approximately \$1,200,000,000. This includes the cost of the synthetic rubber program and chemical plants built by Army Ordnance and Chemical Warfare, except where such plants are part of an integrated operation. The synthetic rubber program will eventually cost an estimated \$750,000,000 but was still 25 per cent short of completion at the end of 1943. The military explosives program, with a total estimated cost of \$350,000,000 was almost completed at the end of 1943, as was the Chemical Warfare program with an estimated cost of \$30,000,000.

Detailed production data on individual chemical items for the years 1942 and 1943 are shown

in the accompanying tabulation.

## U.S. CHEMICAL PRODUCTION DATA

| Unit                                  | 1942                                    | 1943 *         |

Expansion also was marked in the so-called Fine Chemical Group embracing many products in an advanced state of processing and including such items as alcohols, solvents, acids, alkaloids, and salts which find their way into pharmaceutical medicinals, foods, and industrial manufactures.

Sulfa drug production, included in this group, exceeded 9,000,000 lbs. in 1943, a rise of some

500 per cent over prewar totals.

Synthetic vitamins, the antimalarial compound atabrine or quinacrine which is taking the place of quinine, and the antibacterial wonder penicillir are among the recent developments which have found their way into the production of the chemi-cal industry. Penicillin is obtained through the growth of a mold feeding upon a nutrient (corr steep liquor), and the process is painfully slow The success one company has had in providing penicillin in the near-pure form of a crystalline salt may be the first step in synthesizing this destroyer of pneumococcic and gonochoccic bac-

teria. (See MEDICINE.)

The war's technological advances have extended the frontiers of research and development. They have expanded the chemical industry's sphere in industry and world markets considerably. Its ability to meet the crushing blow of suspended rubber imports with highly efficient synthetic compounds made from alcohol, coal, and gas, must be set down as one of the greatest chemical accomplish-

ments in the world's history.

Plastics output was accelerated upon our entry into the war to serve in the place of metals and rubber. Plastics quickly found new tasks in aircraft, naval vessels, and army equipment, and on such a scale that virtually their entire production has been denied for civilian use. Because they possess properties not found in other materials, plastics serve more than 1,000 uses on a battleship, several hundred in a bomber. It is estimated that we are now producing plastic and synthetic resin materials at a rate of close to 300,000 tons annually. See PLASTICS.

Despite its record expansion, the chemical industry had to contend with an increasing man-power problem in 1943. This became clearly more pronounced as the year progressed, and is now regarded as a determining factor in all further productive efforts of the industry. Employment showed a slight drop at the end of 1943 which was only briefly compensated by an increase in the workweek with an accompanying increase in average weekly earnings. Details are given in the follow-

ing table:

# CHEMICAL INDUSTRY MANPOWER SURVEY

|      |           | 77 7       | Average  | Average |                       |

Estimated. b New series; back figures not yet published.

Chemical prices last year continued on an even keel. The U.S. Department of Labor Chemical Price Index stood at 96.3 for November, 1943, as compared with a 1942 average of 96.2. The corresponding figure for 1940 was 85.1 and for 1941 87.2. Thus the chemical industry returned to its pattern of stable prices as soon as the initial war impact on its price structure was over. See CHEMISTRY.

H. E. LUEDICKE.

CHEMICAL WARFARE. See BOMBS; CHEMICAL INDUS-TRY; CHEMISTRY under Explosives.

CHEMISTRY. In 1943 American chemical industry was not found wanting in the performance of its

responsible task as the arsenal of democracy. In August, Donald Nelson reported that the \$14.-000,000,000 construction program was nearing completion, with the ammunition and explosives program 95 per cent complete, chemical 90 per cent, shipping 84 per cent, aircraft 77 per cent, high octane gasoline 63 per cent, and synthetic rubber program 61 per cent achieved. Although production statistics are still restricted the follow-

ing important items were released during the year.

Abrasives. In his Schoellkopf Medal address,
Ridgway described boron carbide abrasive for sand-blast nozzles, precision gauges, and tool-steel grinders. Unlike silicon carbide, which distills, B.C melts at 245°C. and can, therefore, be molded so that the crystals knit together.

Alcohols. Ethanol for smokeless powder, mustard gas, Buna S rubber, and industrial solvents will nearly equal demand next year for 590,000,000 gal.; and there was a 100,000,000 gal. stockpile at the end of 1943. High-proof alcohol production by June, 1944, will be five times that of 1942; these needs are so large that the distillation of whiskey undoubtedly will not be resumed for the duration. In Cuba, failure to agree upon importation price will keep black-strap molasses there during 1944, for conversion into beverage alcohol. Approximately 50,000,000 bushels of Governmentowned wheat were made into granular flour for industrial alcohol during 1943; but grain alcohol plants projected for Wisconsin, Iowa, and Illinois in March, 1943, were subsequently cancelled to conserve edible grains. Corn (2,400,000 bushels) marked as a source of alcohol early in 1943 was withheld by the farmers who found it more profitable to feed it to the hogs.

WPB-sponsored commercial scale experiments of alcohol from woodwaste, included the German Scholler process, the Swedish process, and a process developed by the Department of Agriculture. In the latter process, sodium sulfite, by-product of the wood pulp and coke industries, is cooked in water with granular wheat flour. Separate layers form of protein, diastase liquor, and starch. The diastase ferments the starch to sugar, eliminating the use of malt, an expensive ingredient. The Swedish industry is credited with producing 12,-000,000 gallons annually from sulfite liquor; a major American company has bought the rights to the Swedish patents and the services of experienced Swedish chemists. Potentially, 40,000,000 gallons of alcohol could be claimed each year from two large lumber-producing western States alone.

Hercules Powder Company announced the production, from waste pine stumps, of hydroabietyl alcohol, a monohydric alcohol of moderately high molecular weight for use in preparing synthetic

resin and as a plasticizer.

Alloys. Created to stretch the nation's supply of strategic metals, new alloys include silver and arsenic as a bearing metal to substitute for tin; molybdenum tool steel developed by Westinghouse to replace tungsten from China and Burma; a British soft silver-solder containing a small per-centage of tin on a lead base; beryllium-coated copper plates; and an alloy unusually low in nickel and chromium to withstand temperatures up to 750° C., developed at the Battelle Memorial In-

Two thousand years ago China issued cast-iron coins to conserve copper. Today history repeats itself. The zinc-coated 1943 steel penny issued, appropriately enough, on Lincoln's Birthday saved 4,600 tons of copper, the quantity consumed in the 1942 one-cent piece; the zinc coating is only

.00025 inches thick. The old penny contained copper, zinc, and tin in the ratio 90/5/5. However, the new copper penny scheduled to appear on Jan. 1, 1944, will return to copper. It is made from discarded cartridge cases, and contains 85–90 per cent copper and the remainder tin and zinc.

Aluminum. During the year 1943 the output of

Aluminum. During the year 1943 the output of aluminum (q.v.) continued on a tremendous scale. This was reflected in the fact that forty-three spectrographs operating this year in the research laboratories of Alcoa consumed 450,000 feet of film, enough footage to make prints of fifty full-length feature motion pictures. Unlike steel, aluminum rivets are chilled in Dry Ice to -40° C. and then hammered cold within thirty minutes. Storing them in cellophane bags keeps them cold three times longer, saving thousands of dollars spent in re-sorting unused rivets. Spot welding of aluminum is also saving much in labor and material.

Apparatus. Laboratory apparatus is being allocated by WPB to college military-training programs. A high frequency electronic oscillatory system producing penetrating heat is being used to case-harden small gears and bearings, to heattreat tobacco without removing it from the hogshead, to kill insects in grains and cereals, and to glue plywood. The Atlantic Refining Company has perfected a mass spectrometer for analyzing aviation gasolines. Harvey has developed a phosphorescent microscope by flashing ultraviolet light on phosphorescent metals; it harbingers new discoveries in biology and mineralogy. Goodyear Research Laboratories use supersonic waves to locate flaws in rubber tires, as x-rays expose flaws in steel. Brumberg and co-workers in Leningrad described an ultraviolet microscope which gives a colored visible image.

Astronomy. Gold and thorium were discovered in the sun by Charlotte Moore, who compared laboratory spectral lines with "low temperature lines" found in the sun spots. Three observatories independently identified NH<sub>2</sub> in the heads of comets. Struve discovered gaseous nickel outside, and titanium and probably manganese inside, stars in the constellation of Libra. M type red stars contain an atmosphere of titanium oxide, and R and N type stars are enveloped in gaseous carbon, according to Lee. Whereas most stars in the Pleiades contain ionized calcium and hydrocarbons, two of these "seven sisters" contain ionized hydrocarbons only; and neutral hydrocarbons, prominent in many stars, are completely missing; Adams considers this to indicate the limited dimensions which these clouds must have. Luminous hydrogen streaming at 1,200,000 miles per hour from the constellation of Auriga was reported by Merrill. The largest prism ever made, measuring 26 inches in diameter and weighing 260 pounds, has been delivered by Bausch and Lomb to the Case School of Applied Science. Temperature changes in Washington, based on observations of calcium clouds in the sun, were correctly predicted 60 per cent of 201 days by the Smithsonian Institution. See also ASTRONOMY.

Awards for 1943. The Chemical Industries Medal was awarded to J. J. Grebe of the Dow Chemical Company for his apparatus for automatic anticipatory control of chemical reactions; the Hillebrand Prize to J. F. Schairer for his work on multicomponent silicate systems; the Eli Lilly & Co. prize to H. E. Carter; the Franklin medal to Harold C. Urey for his discovery and production of heavy hydrogen, and to G. W. Pierce for his development of "electrically squeezed quartz crystals" for control of radio frequency and preci-

sion electric clocks; the Willard Gibbs medal to C. A. Elvehjem for his discovery that copper is the oxygen carrier in hemoglobin, for the role of nicotinic acid in animal nutrition and cure of pellagra, and for other studies of trace elements in nutrition; the John Wesley Hyatt medal to F. H. Shaw for his plastic molding process widely used in war production; the Nichols medal to A. B. Lamb for "his investigation in inorganic and physical chemistry, leadership in defense against poison gases, and as a teacher, administrator and editor"; the Mead Johnson award to Vincent duVigneaud for establishing the structure of biotin; and the Schoellkopf medal to R. R. Ridgway for his work on boron carbide. Awards announced for 1944 include the Perkin Medal to G. F. DuBois for his technical developments in Monsanto, and the Nichols Medal to C. S. Marvel for his studies on vinyl polymerization.

Bibliography. The U.S. Property Custodian seized copyrights, and arranged with Edwards Brothers for photolithographic reprints, of original German editions, including Beilstein's 59-volume Handbuch-der-Anorganische Chemie, available for \$400 in contrast to the German price of \$2,000.

Cadmium. Ordinarily cadmium electroplating is less than 0.0003 inches thick. By a new process duPont plates small metal parts for airplanes with heavy coats 0.02 inches thick.

Chlorine. A new manufacturing process developed by the U.S. Department of Agriculture utilizes NOCl, HCl, NO<sub>2</sub>, and H<sub>2</sub>O, which are byproducts of the potash industry. A silica catalyst at 40° C. is employed. Hercules Powder Company patented the removal of sulfuric acid impurities from liquid chlorine, by absorption on coke; acid impurity heretofore ruined metal compressors handling the liquid chlorine.

Coal. A \$2,500,000 five-year research program continues the studies initiated in 1935 by Bituminous Coal Research Inc. Twelve major investigations will affect the bituminous coal consumption, scheduled to reach 600,000,000 tons in 1943. Fluid coal, which is finely pulverized coal mixed with air, will flow through standard pipes. Widening applications are envisioned by the Battelle Institute in forging and heat-treating, in annealing and enameling furnaces, and in other metallurgical processes previously consuming large quantities of petroleum.

Drugs. Biotin has been synthesized by Merck & Company; the synthetic product is identical with that announced by du Vigneaud last year.

Penicillin made its public debut during the year 1943. It is grown by three methods: surface culture; bran culture in which bran is moistened with liquid nutrient; and submerged culture in corn steep liquor vats. After growth the mold is concentrated at very low temperatures, closely controlled because of the unfortunate ease of decomposition of the active principle. Next, impurities are removed with an organic solvent, the solvent is separated by evaporation, the residue extracted with a second solvent, the pH delicately adjusted for conversion to the barium salt, and finally a solution of the sodium or calcium salt is prepared and hermetically sealed in ampules. A typical product has a potency of 100 to 400 Oxford Units per milligram, the Unit having been estab-lished by a group of Oxford scientists in empirical inhibition experiments. The National Research Corporation has developed a vacuum distillation process for the dehydration step, which Chas. Pfitzer & Company will use in accelerating their production of the drug. Science News Letter,

Nov. 29, 1948, instructs physicians to prepare, in their own laboratories, a supply of penicillin for treatment of local, but not internal, infections.

Manufacturing costs at present are \$50 a gram, enough for ten doses. Pilot plant production was started in the fall of 1941 by Merck, Squibb, Pfitzer, the Lederle Laboratories and others. During October of 1943, A. L. Elder was made rocoordinator of the penicillin program, rigidly controlling the projected production of 27 billion Units annually by a number of companies. DPS produced penicillin in quantity by Nov. 1, 1943, at a \$600,000 plant in Oakland, Calif., operated by the Cutter Laboratories. A submerged culture plant, 25 billion Units annually, by the Heyden Chemical Company, is to be completed at Princeton, N.J., early in 1944. Therapeutic Research Corporation is preparing a selected strain, trade-named Notatum, of Penicillium notatum, dilutions of one part of which per million inhibit the growth of staphylococcus aureus which causes boils.

Pentothal (a new anaesthetic which has been called one of the greatest drugs of this war) unlike ether and the hydrocarbons, is not an explosive

Quinine, used throughout the world to control malaria, had a peacetime production of 2,000,000 pounds per year, enough to treat 50,000,000 cases. Today, the urgent demand to protect our fighting forces in the southwest Pacific alone, requires five times this quantity. The substitutes atabrine and plasmochin are being produced at rates of over 100 times prewar levels. Meanwhile, the hunt for additional source of quinine intensified in Peru where the cinchona tree was originally discovered 300 years ago before being transplanted to the Far East. Large plantations are being developed in Guatemala. In addition, a drive to collect quinine from the nation's drug stores netted over 143,000 pounds this year. In November the War Department hinted that it had tested a new anti-malarial in the jungles of New Guinea.

Production of the sulfonamides is veiled in military secrecy, but in all probability far exceeded the 1942 output of 10,000,000 pounds, which itself was twelvefold greater than the 1940 figure. For the use of these drugs, see MEDICINE.

Dyes. Sawdust dye, rivaling in color and stability the historic coal-tar dyes, has been reported by Chemical Age. Waste sawdust is heated with sulfur and caustic soda to yield water-soluble coloring matter.

Electrochemistry. Development and widespread use of highspeed anode breakers for nearly all mercury arc rectifiers is considered one of the major developments in the field. New electrochemical processes include silver plating on magnesium; the consumption of tons of silver daily for silver-plated bearings for airplane motors, by du-Pont; a revolutionary pre-treatment with disodium phosphate containing traces of titanium to improve the corrosion resistance of zinc plate, by Westing-house; and the "B.C.F. addition agent," formula not disclosed, by duPont, one ounce of which per gallon of copper electroplating solution so increases the hardness of the copper deposit on electrotype printing plates that the thickness of the layer may be reduced one-third. See ELECTRICAL INDUSTRIES.

Explosives. DuPont announced a high explosive more powerful than TNT. It contains hexamine, which is made from ammonia and formaldehyde. Another explosives intermediate, glycerine, was banned for use in foods, tobacco, cosmetics, and toilet preparations beginning April, 1943, and medialet preparations beginning april, 1948, and medialet preparations beginning april, 1948, and medialet preparations beginning april 1948, and medialet preparations april 1948, and medialet preparations beginning april 1948, and medialet preparations april 1948, and medial ical use was restricted to 60 per cent normal,

Propylene glycol, diethylene glocol, and apple syrup are being substituted for glycerine to keep tobacco moist.

Black powder, a mixture of sulfur, charcoal, and saltpeter, used for centuries as gunpowder, has special limited uses in war time: it starts torpedo and depth charges on their sinister journeys; ignites propellent charges in all kinds of shells; and serves as a fuse which detonates anti-aircraft shells, and for signal flares, primers, and other

ordnance purposes.

Smokeless powder, chief military propellant, ignites too slowly, and is therefore set off by a charge of quick-flashing black powder. Pellets of smokeless powder with more uniform performance were made possible by duPont and the Western Cartridge Company. Throughout the year, WPB carried a campaign to the housewife for salvaging waste kitchen fats used in producing nitroglycerine

for smokeless powder.

First developed in 1936, the amazing material primacord is revolutionizing certain military operations. First developed as a substitute for a leadcovered detonating fuse, it can itself tear down trees, set off chemical land mines, or plough a shallow trough in the earth for decontaminating areas containing poison gas. Primacord will stand friction, can be beaten with a hammer, and burns without exploding. Miles of it can be laid to set off a large number of chemical land mines simultaneously, for its explosion travels nearly four miles in a second.

The refineries in the manufacture of TNT are now yielding a purer product. Particularly, munition plant workers today face less hazard of poisoning from nitrogen dioxide fumes than workers in 1917-18. Japan is especially fortunate in obtaining toluene for TNT from the great oil fields of Borneo, and is apparently utilizing this advantage

fully. See also BOMBS; CHEMICAL INDUSTRY.

Fots. Production of fats and oils is expected to total 5,800,000 tons in 1943-44. Cotton and peanut oil prospects deteriorated in August, 1943, but this was offset by a favorable increase in soybean oil. Castor oil is turning up in unexpected places: as hydraulic fluids in the recoil cylinders of big guns; as shock absorbers on airplane landing gears; and as raw material for sebacic acid in manufacturing nylon. Petroleum chemists have developed two mineral-oil substitutes for palm-oil lubricant in the manufacture of cold-rolled steel, and for olive-oil in wool processing. Boehm and R. Williams discovered that normal propyl gallate strongly inhibits the rancidity of peanut oil.

Fertilizer. Approximately 450,000 tons of nitrogen were consumed in fertilizers for the year ending June 30, 1943. Restrictions on synthetic ammonia were counter-balanced by larger importations, some million tons, of Chile saltpeter. In the year to come, the nitrogen supply will be considerably larger, possibly 700,000 tons; including 685,000 tons of Chile saltpeter, and additional quantities of fixed nitrogen from the synthetic ammonia plants which are now more than meeting the requirements for nitrogen explosives. *Potash* is similarly abundant. Supplies for both this year and the coming twelve months will be 540,000 tons of potash as K<sub>2</sub>O. Excellent results are reported in using as fertilizers, since the war began, more than 20,000 tons of potassium flue dust from ferromanganese furnaces. The *phosphate* fertilizer outlook is likewise excellent. Despite the sulfuric acid bottleneck in superphosphate production, 5,600,000 tons of normal superphosphate were distributed within the country this year; and a large part

of our concentrated superphosphate, which totals 3,000,000 tons of 45–47 per cent  $P_2O_5$ , was shipped overseas under lend-lease commitments. At least 7,000,000 tons will be available this coming year. In contrast, phosphate fertilizers in Germany are

now only one-tenth prewar tonnage.

Foods. Three billion loaves of bread have been treated with duPont's "Mycoban propionate salts," an inhibitor against molds which each year destroy an estimated total of \$100,000,000 in breads, cheeses, butter, and other foodstuffs. The dairy industry reported 85,000,000 pounds of butter were wrapped in paper saturated with Mycoban this year. Since the production of dried milk in the United States is expected to reach 150,000,000 pounds in 1943, the observation by McFarlane that less than 0.1 per cent wheat germ oil doubles the time dried milk will stay fresh is an important discovery. The Department of Agriculture forecast the possible recovery of a billion pounds of edible proteins from fodder heretofore suitable only for cattle. The process is described above under Alcohols.

Glass. Glass made without sand sounds fantastic, but the American Optical Company described such material containing only oxides of boron, aluminum, cadmium, and zinc. Product of ten years of research, the new glasses will provide better camera and microscope lenses. Other new glasses included, by the same company, a secret technique for surfacing nonreflecting eyeglasses and windshields; a Pittsburgh Plate Glass tank lining which resists shock, temperatures of 330°C., and is five times stronger than ordinary glass; glass fiber with tensile strengths of 80,000 pounds per square inch; spun glass for surgical sutures; and safety glass to resist the impact of birds against airplane windshields at high altitudes.

Insecticides and Disinfectants. A third Lethane insecticide, another organic thiocyanate, was announced by Röhm & Haas Company. Dust containing 2 per cent Lethane reduces to half the now scarce rotenone required in insecticides. Brisco in England reported the use of inorganic dusts, such as lime, talc, silica, and diamond as insecticides; their efficiency increased with the hardness of the material and the angularity of the dust particles. While we are fighting the Japanese beetle, Germany is energetically battling the Colorado beetle in France, and lately in Belgium and Holland.

Two plants to be opened in 1944, will increase by 55 per cent the total production of Freon-12 refrigerant. Freon has been adopted by the Government as the dispensing agent for the new aerosol insecticide used to combat malarial mosquitos and other insects in the tropics. To eject the insecticide as fog-like particles, called "aerosols," a one-pound dispenser containing a mixture of highly compressed Freon gas, concentrated pyrethrum, and sesame oil is used. It can discharge the aerosol for fifteen minutes, disinfecting 20,000 cubic feet. We may look to this military invention to rid us of mosquitos and flies in our homes after the war.

DuPont described "Arason" tetramethylthiuramdisulfide, suitable as a nonmetallic seed disinfectant. "Thiosan" is the same product dispersed in water for controlling bentgrass disease. Sterilization of the air, as in air-raid shelters, with triethylene glycol vapor was advocated by Jennings and Bigg; chlorine and propylene glycol have also been used.

See also INSECT PESTS.

Iron and Steel. To conserve chromium and vanadium in alloy steels, Merle Randall has developed a special heat treatment for ordinary low-carbon steel. The steel is heated to 830°C., then suddenly quenched in a 35 per cent solution of caustic soda. The metal can be cold-rolled without difficulty. In Sweden, a cast-iron substitute for roller-bearing steel has been developed to reduce the consumption of copper, tin, and antimony ordinarily used in bearing metals. Stainless steel tubing for 75 and 40 mm. guns is replacing forged steel. Standard Oil has a new process proposing to substitute natural gas, or hydrogen from natural gas, for coke in the blast furnace. As the finely ground iron ore sifts downwards through reducing towers, particles are heated by burning gas to incandescence, then reduced by hydrogen at temperatures about 1300°C. and finally transformed into pig iron by reaction with hot gases containing uncombined carbon. Slag is formed with limestone as in the ordinary blast furnace.

Magnesium. Gigantic increase in magnesium production, nearly 100-fold over 1939, has nearly outstripped immediate consumption. The Pidgeon ferrosilicon process (1943 Year Book, page 124) today represents an investment of \$40,000,000 in one

Canadian and five United States plants.

Government plants produced 15,705 tons in July; Dow plants, 1,750 tons. In August, Basic Magnesium Inc. went into full production in its electrolytic plant near Boulder Dam where 400,000,000 tons of dolomite were uncovered. In Louisiana, Mathieson Alkali is producing over 25,000 tons from dolomite. The ore is calcined with natural gas, converted into chlorides with calcium chloride. and calcium carbonate precipitated with carbon dioxide. The magnesium chloride solution is concentrated and electrolyzed. The Dow plant at Marysville is in operation. Costing \$40,000,000, it uses 1,000 tons of silver bus bars worth \$20,000,000 and loaned by the Government to release copper. This plant is receiving magnesium chloride from Texas until the adjacent Ludington, Mich., brine unit is completed. Both plants incorporate novel features to save strategic materials: enormous wooden beams, plastic pipes, and secondhand boilers, pumps, and launders.

By January, 1944, Revere Copper & Brass Inc. opened the largest magnesium sheet and strip mill in the United States, with a capacity of over 7,000 tons annually. Meanwhile in North Carolina, Georgia, and the Pacific Coast the Bureau of Mines discovered about 100,000,000 tons of olivine, averaging 47 per cent magnesia. Hitherto a refractory, olivine is under study by Bureau metallurgists. Collins and Glass proposed a reduction of dolomite with calcium carbide.

Metals. Bolivian tungsten tailings containing less than 1 per cent tin, or tin tailings containing less than 1 per cent tungsten, can be profitably treated for tin and tungsten respectively by a promising new process. Zinc and cadmium surfaces are being protected from salt spray by dipping in a chromate

solution.

Powder metallurgy has been practiced for over a century in molding platinum and iridium articles. Early in the present century, tungsten filaments for electric lamps were formed from molded briquettes. Today, all types of machine parts and tools are made from particles of single metals: metals that alloy during sintering, metal mixtures that remain unalloyed, and mixtures of metallic and nonmetallic minerals; also, mixtures of metals whose densities are so different that they would separate if melted. Heat-cemented powders of boron carbide, tungsten carbide, tantalum carbide, and titanium carbide form cutting tools nearly as hard as diamonds. Under war-time impetus, many electri-

cal resistance parts have been made from powdered tale and metal mixtures which retain the original electrical characteristics, ordinarily destroyed in alloying. Examples are copper-tungsten, silver-nickel, and tungsten-graphite. Self-lubricating bearings are made from castings sufficiently porous to retain oil throughout the life of the machine. The pow-ders themselves are produced by spraying molten metal into a current of air or steam, by mechanical distillation, by electrolysis, and by gaseous reduction of metal salts. In fabricating an article from metal powder, a mold of hardened steel is prepared of the precise size and shape of the object desired. The metal powder is placed in the mold and a controlled pressure applied. The pressure may be slight, for example in making porous metal filters; or it may be greater than 100,000 pounds per square inch. The shaped object is removed from the mold and heat-treated, "sintered," just below the fusion point of the metal mixture, by passing on an endless belt through gas or electric furnaces in a reducing atmosphere. The sintering knits the particles together so that they emerge with a bright, smooth finish ready for use without machining or finishing. Steel, for instance, is sintered at

about 1,100°C. for twenty minutes.

New Materials. In 1940 Minger and Leigh-Smith announced their preparation of element 85 from radium. This year they described a new method for isolating the element, and named it Anglohelvetium

in honor of their native countries.

Granular silica gel is now employed in packaging guns, planes, and machinery to prevent rusting and corrosion during transit overseas. No longer is it necessary to slush metal parts with heavy grease, a practice which required laborious de-greasing in solvent baths. A package containing silica gel impregnated with cobalt chloride is sealed up with the machinery in a moisture-proof Pliofilm bag. If the relative humidity of the entire package is above 20 per cent, the threshold above which corrosion occurs, the pink cobalt chloride turns blue, warning the inspector that fresh silica gel bags must be

inserted in the package.

Nylon. The miracle fabric and plastic developed by duPont has enlisted in the armed forces for the duration. Parachutes are the largest item: extra tough, special-weave cargo parachutes for lower-ing cars and jeeps to the ground from planes; parachutes for dropping fragmentation bombs and star shells. Nylon rope developed in 1940 for "on the fly" air-mail pickup, seems to withstand the sudden shock between the cable hook of the plane and the mail container; combines the strength of steel cable with the springiness of rubber. Today in war it was nylon rope that towed the first glid-er across the Atlantic from Montreal to London. Three times more elastic than manilla, nylon rope is used in training mountain-climbing troops. A half inch nylon rope can lift a load of three tons; in contrast to rubber, nylon under stress of sudden pull stretches rapidly but recovers with a slow gentle bounce, the action required in the perfect shock absorber. Three-quarter million pounds of yarn were used this year in bomber tire fabrics, in-creasing the strength of the tire so greatly that large bombers and cargo planes do not require larger tires.

Nylon bristles, first appearing in toothbrushes, are now entirely diverted to tapered paint brush bristles, which outlast the hog variety many times over. Because of its resistance to mildew, nylon is ideal for tent fabrics and shoe laces in the tropics. Impregnated with neoprene, nylon is stamped into diaphragms for airplane engine carburetors. Wo-

ven into a cloth containing 30,000 tiny holes per square inch, it is performing the important job of filtering blood plasma for transfusions. Nylon fishing lines, for the time being, have become surgical sutures, millions of feet of which are shipped to medical supply depots the world around.

In the years after the war, nylon once more will grace the feminine leg and charm the masculine eye; for the duPont nylon plants will be able to shift from parachutes to stockings on a few days notice. Drapery and upholstery fabrics, shower curtains and slip covers, will certainly be postwar uses; for crush resistance gives nylon a distinct advantage over older fabrics. Window screens fashioned of this amazing material can be produced in any color, will not stain the sills, will not corrode, and will require no painting. Pencils and sharppointed objects can be shoved through the nylon screen without damage. The strength and elasticity of the strands will pull the plastic screen back into place. These new screens will roll up and down on tracks like a window shade, and need not be taken down in the fall. Experimental screens have stood up well along the seashore, where the salt spray corrodes metal screens in a few months. In spinning the nylon "wire" for the screen, the pigment will be incorporated in the nylon flakes so that the color permeates the entire filament and lasts as long as the wire; probably copper-brown wire will be chosen since it is easy to see through dark screens. Once again, as before the war, tennis and badminton rackets will be strung with nylon; fish will be caught on nylon lines; teeth will be brushed with nylon bristles.

So great has been the demand for nylon as a febria that its preparties as a plactic have been as

fabric, that its properties as a plastic have been on the whole overlooked. Actually, it always conformed to the common definition of a plastic; and after the war its intrusion into this field is inevitable. Although most thermoplastics soften at 70°C. nylon does not soften until it reaches a temperature of 230°C., a temperature at which most thermosetting plastics melt. It is one of the lightest of the plastics, despite its extreme toughnessspecific gravity 1.06-1.19 contrasted with 1.27-1.56 for cellulose acetate. Nylon does not burn or rot; is inert to oils, acids, alkalies, and metal inserts; is easily machined; and can be rolled in standard presses. The first strictly plastic application of nylon was in the manufacture of bearings which require no lubrication, save perhaps water, for light loads at high speeds, or heavy loads at low speeds. Molded military articles, military tubing extruded like macaroni, vacuum packaged films, electric wire insulations applied by nylon in solution, shiny fabric coatings which wear well and do not crack, zippers of molded nylon—these are some of the many applications of nylon as a plastic which hold great promise for future expansion in this entirely virgin field.

Paint. Camouflage has now, in its service, green paints which not only match the foliage in color but also reflect infra-red rays so that they cannot be detected by infra-red photography. The Germans are protecting iron with a new paint material containing barium nitrophthalate. Pulverized garnets, imbedded in a plastic binder, form the basis of a non-skid deck paint developed by Goodyear

of a non-skid deck paint developed by Goodyear.

Petroleum. A number of outstanding petroleum authorities disagreed this year on the danger of an imminent oil famine. Per K. Frolich of Standard Oil, in his presidential address to the American Chemical Society, optimistically accepted an estimate of six hundred billion barrels reserve or a three-hundred-year supply. Frolich indicated that

the United States is particularly favored as an oilproducing country; for while its land area comprises only 5 per cent of the earth, it contains 15 per cent of the structure most favorable for the occurrence of oil fields. Back of our oil reserves stand three trillion tons of coal beds, which are already being converted into gasoline, but at a cost

double that of natural petroleum. On the other hand, Benjamin Brooks on two occasions in Chemical and Engineering News, warned of the probability of a considerable shortage of natural petroleum within a year or two, and urged extensive development of petroleum substitutes from oil shales, coal, or agricultural materials to relieve an imminent shortage of petroleum precipitated by the war. As early as 1936, Brooks had already forecast the domestic shortage, vigorously denied by some petroleum authorities. He showed that most oil-producing States have passed through their peak in production. America is changing from an oil-exporting to an oil-importing nation, and the discovery of new oil fields is decreasing alarmingly. Moreover, use of petroleum as a raw material for synthetic chemicals will inevitably bring higher price structures. He attacked Egloff's statement that "petroleum is now being formed at a greater rate than our consumption of it, and that all we have to do is to find it." Increasing imports from Venezuela can be anticipated; and we may expect prices to rise as petroleum-bearing countries increase their export taxes. When the price of petroleum has advanced sufficiently, the development of other sources, such as shale oil, will involve operations on an enormous scale which undoubtedly will be successfully projected only by large companies strongly financed and well managed, whose existence depends on tremendous output at small profit per ton of shale.

Approximate costs per gallon in producing gasoline, including normal overhead and 10 per cent depreciation, are compared by Brooks from data furnished by Farish of the Standard Oil as follows: (a) Bergius process, high pressure coal hydrogenation, 22.6¢; (b) European Fisher process, from coal, 19.2¢; (c) European Fisher process, from natural gas at 5¢ per cubic foot, 8.8; (d) modern high pressure hydrogenation of percentages at \$1.20 per hard, 5.54¢. (e) troleum crudes, at \$1.20 per barrel, 5.54¢; (e) modern oil refinery thermal cracking of crude, at

\$1.20 per barrel at the well, 5.3¢.

Motor fuel of high octane giving increasing mileage per gallon and resulting in substantial savings in the nation's motor-fuel consumption will tend to offset the increased prices of gasoline over the

years to come.

The utilization of petroleum and natural gas for the manufacture of chemicals will continue to expand phenomenally. Most processes for manufacturing these chemicals begin with ethylene or propylene, originally obtained by pressure cracking processes; but newer processes, cracking at higher temperatures or catalytically, have greatly increased the potential output of these olefins, giving in addition, butane and butadiene.

Of these myriad products, butadiene for synthetic rubbers and aviation gasoline received the spotlight in the 1943 arena. Quantitatively, synthetic rubber would consume very little of the petroleum output and its cost after the war will depend on the flow of aviation gasoline, since both require the same raw material. See RUBBER

The petroleum resources of Germany and Japan were estimated in an interesting analysis by Cities Service Company. Japan's output for 1941 was approximately 8,800,000 barrels, of which 5,500,-

000 were petroleum substitutes. Increase in synthetic oil production raised the total production in Japan in 1942 to 10,000,000 barrels, which was supplemented by 23,000,000 barrels from Burma and Netherlands Indies. In normal times, these two latter countries produce 78,000,000 barrels per year. It is interesting to contrast these figures with Brooks' estimate that the Allied wartime needs may reach 5,000,000 barrels for a single day. Axiscontrolled European countries in 1942 produced 112,000,000 barrels, up 20 per cent over 1941. Approximately half of this is synthesized from coal.

So little real information may be released on aviation gasoline, that it suffices to mention that new methods were devised by Universal Oil Products for converting normal pentane into isopentane; by Ipatieff and Heansel of the same company for "triptane," 2, 2, 3-trimethyl butane; by Standard Oil of New Jersey for neohexane; and by Houdry using an adiabatic catalytic cracking unit originally operated semi-commercially for butadiene.

Although the refineries are producing tremend-ous quantities of aviation fuels, the necessary goals have not yet been attained. War requirements are at least twice the production realized in the 45 aviation gasoline plants now in operation. Losses in aircraft have been less than anticipated, with the result that there have been more planes to fuel.

Postwar motor performance is not hard to guess. In recent tests at Detroit, a stock car adapted to

100-octane ran forty miles to the gallon.

Looking into the future, a number of processes for substitute gasoline have been announced. Egloff estimates that more than 800,000 vehicles, mostly trucks and busses, are operated by producer gas from wood-chips, charcoal, and other solid fuels. The Bureau of Mines has set up a pilot plant at Pittsburgh for hydrogenating coal to gasoline. The Chinese Army is using a gasoline substitute

obtained from pine tree stumps.

The German planes which invaded England in 1940 were fueled with 87-octane; but the English fighters which rose up to meet them were propelled by 100-octane gasoline produced in the United States. The fighting edge afforded by this higher octane fuel contributed largely to staving off the Germans. Comparative tests show that a certain bombing plane using 87-octane reached an altitude of 26,000 feet in 19 minutes, and had an absolute ceiling of 33,000 feet; whereas using 100octane gasoline it required only 12 minutes to reach 26,000 feet, and the ceiling was 37,000 feet. Ironically, the Japanese are cracking rubber to produce gasoline; while in the United States we crack petroleum to produce rubber.

Petroleum Gases. Natural gas, a complex mixture of compounds of carbon and hydrogen, is produced in 37 of our 48 States. Proved reserves are comservatively estimated at 85 trillion cubic feet and consumption in 1941 was 2.8 trillion feet. This gas is being withdrawn from both "dry gas fields" and "casing head fields"; in the latter, oil occurs along with the gas. In other large oil sources known as "distillate fields" the merchantable gas is returned to the ground, where it is stored for future use.

For a long time natural gas has been used wherever heat is needed, as in fabricating and heattreating metals, baking ceramics, etc. New outlets for natural gas are concerned with (a) its conversion into liquid fuels, and (b) manufacture of

chemical products.

According to Chemical and Engineering News, 555,000,000 gallons of liquid fuel were produced from natural gas in 1942. The processes for producing this petroleum are several. (a) Earliest of

these was low pressure pyrolysis, which formed a large number of cyclic compounds especially valuable as blenders in aviation gasoline. Valuable olefins are also produced in this process, as for example ethylene, used in the manufacture of tetraethyl lead and much of our industrial alcohol. (b) A second process, high pressure pyrolysis, utilized 30 per cent of waste butane gases prior to the war, to produce approximately 15,000,000 barrels of premium motor fuel. (c) Dehydrogenation, polymerization, and hydrogenation of these gases gives us high octane aviation fuels. (d) Recently, paraffin alkylation has made possible our present superiority over the Axis nations in aviation fuels, for it was discovered that ordinary hydrocarbons would add onto olefins, giving fuels having octane ratings greatly in excess of 100. (e) Even more recently, isomerization of normal butane to form isobutane has swelled in volume the raw materials needed for the alkylation process. While these volumes are necessarily a military secret, the new facilities constantly being created presage enormous expansion in the use of natural gas in the manufacture of synthetic gasoline.

Natural gas has also become a raw material for many synthetic chemical products. The fantastic synthetic rubber program, particularly the Buna S type rubbers prepared from butadiene, is making the greatest demand at this point. Natural gas is also being cracked to produce hydrogen, which eventually finds its way via ammonia and nitric acid into explosive TNT, ammonium nitrate, and nitroglycerine; and glycerine for the latter explosive can also be produced from natural gas. Petroleum gas will make most of the 300,000,000 gallons of toluene, twenty times greater than in the last war, for our TNT. The same petroleum gases can make various plastics, wood alcohol, and de-

tergents

See Вомвя.

As enormous as the chemical outlets for natural gas may appear, they still consume but a small percentage of the total available raw material. For example, the prewar production of wood alcohol, both synthetic and from wood distillation, amounted to 20,000,000 gallons; yet, this could theoretically be produced from a single gas well of 10,000,000 cubic feet daily capacity. In other words, the potential production of one of our smaller gas wells would flood the market. Similar comparisons indicate that 1,000,000 cubic feet of natural gas per day would furnish all the carbon tetrachloride sold. Again, in natural gas, there are enough butanes available for conversion into butadiene rubber to supply five times the peacetime rubber demand.

Phosphorus. By 1943 Japan was self-sufficient in phosphate rock from the Islands of Oceania, but Germany was forced into a serious shortage for phosphate fertilizers and phosphorus explosives.

Photochemistry. Infra-red rays in wartime industry today dry military paints, dehydrate fruits and vegetables, and quick-dry greensand used in metal-casting molds. Fluorescent substances, like anthracene, were recommended to trace the penetration of colorless waterproofing compounds into cement, or of fireproofing agents into wood, or of fertilizers into the soil.

Photography, Physics. See separate articles.

Plastics. See separate article.

Proteins. Experiments in Columbia University reveal that certain red molds will feed only on specific amino-acids; this property is proposed as a means of analysis of the amino-acids. From the University of Illinois comes a process which may

release a billion pounds of protein for human consumption each year. By this new process corn germ, hitherto restricted as cattle fodder because of its tendency to become rancid, is de-fatted to give an edible protein containing 21 per cent of protein, 85 per cent of which is digestible as beef protein. In another research, the United States Regional Pasteur Research Laboratory chemically extracted a ton of dried grass to obtain 285 pounds of poultry and hog feed containing 58 per cent protein and less than 1 per cent lignin and cellulose.

Quartz Crystals. The natural mineral is essential in

Quartz Crystals. The natural mineral is essential in large quantities for making frequency controlling elements of military radio equipment. Success in utilizing lower grades of raw material and in reducing the sizes of quartz plates used in radio sets during 1943 relieved somewhat the extreme pressure for additional sources of this strategic mineral. U.S. deposits in North Carolina, Virginia, California, and Arkansas, although explored, are not contributing significantly to the supply. The piezoelectric properties which quartz possesses and which make it useful for radio communication are found in several minerals and artificial substances but thus far none gives promise of being an immediate and practical substitute for quartz in large scale application.

Rure Chemicals. The National Registry of Rare Chemicals of the Armour Research Foundation has expanded its file of approximately 6,000 chemicals to include common materials scarce because of war allocations. During the year, 2,100 requests for rare chemicals were handled.

Rubber. See separate article.

Soap. Approximately 900,000 tons of soap were produced in 1943, considerably below the 1942 output of 1,400,000 tons. Tallow and grease were diverted to essential war industries. The Government limited fat consumption to 95 per cent, and by August, 1943, to 80 per cent, of the total fats used in 1940–41. Coconut oil, which formerly constituted one-quarter of our soap-oils, became a premium, and dropped below 4 per cent. Soybean, palm, and domestic oils were substituted. Soap formulas prescribed by the War Food Administration increased the rosin content of soap chips and granules to 15 per cent, and that of toilet bars to 2 per cent. Rosin extenders in brown laundry bars increased from 50,000 tons to 125,000 tons; refined tall oil began to appear as a filler in the American product; also, water-glass which is extensively used in German soaps. Meanwhile, all over the world, American soldiers, sailors, and marines lathered themselves with the "soapless soap" detergents which defy seawater and other hard waters.

Sugar. Jackson of Merck & Company reported that natural sugar was large in pantothenic acid, a good source of niacin, and a fair source of thiamin and riboflavin. It is possible that refining removes these. The National Sugar Refining Company reported that carrots lost 50 per cent of total solids, especially sugar, when blanched before dehydrating. Onions and cabbages similarly lost sugar in the cooking process. The Sugar Research Foundation has initiated a five-year research on chemical and nutritional properties of sugar and derivatives, under R. C. Hockett of MIT.

Sulfur. With the loss of Sicily the Axis lost the source of two-thirds of its sulfur; the remaining third comes from northeast Italy. Sulfur is made into sulfuric acid. Chief consumer of the acid is the fertilizer industry, with chemical and explosive manufacture second. America produces over 3,000,000 tons a year, contrasted with the production of

500,000 tons for Italy, 25,000 tons from Spain, and 200,000 tons from Japan, in prewar days. The Nazis will obviously have to rely on their stockpiles, and on sulfur removed from pyrites or salvaged from coke-oven flues.

Textiles. Electron-microscope examination of wool cells revealed little structure in the outside or cuticle, but fiberous structure on the inside or cor-The difference in behaviour of the two portions of the cell upon dyeing is presumably thereby explained. See Nylon, above; also article on Textiles.

Tin. The new high-speed electroplating of tin strip requires a coating 40–65 per cent thinner, saving 6,000 tons annually. The old hot-dip method

is obviously passe.

Tungsten. The rapidly rising war demand for this metal in steel-making and in the tools used to machine and shape metals led to a 77 per cent

increase in domestic production in two years.

Vanadium. Production of vanadium, "toughness" for armor plate, guns, machine tools, and other ingredients of victory, was the highest in history in 1943. In 1941 requirements outstripped supply by nearly 40 per cent; in 1942 supply met demand; but in 1943 the estimated supply exceeded the demand by a small margin. Early in 1943 an important vanadium "strike" was made in the former ocean beds now forming the States of Idaho and Wyoming. The area is a potential source of millions of tons of vanadium, but development has not been started because of the reduction in the demand for vanadium. In fact, at the present time Government aid for vanadium production is being discontinued wherever possible.

Water. Thanks to the Permutit Company and the

Naval Medical Research Institute the shipwrecked sailor is assured a fourteen day supply of drinking water from his 3.5 pound chemical de-salter. See

WATER SUPPLY.

Wood. At least five distinct treatments of wood are now recognized: (a) preservation, including flame, insect, rot, and chemical proofing; (b) reassembly, or making plywood, paper-board, and such products from wood; (c) chemical conversion of wood into cellophane, sugar, alcohols, explosives, lignin adhesives; (d) seasoning and (e) altering chemical properties, as in hardening and

increasing its strength.

Termites cause an estimated \$40,000,000 loss per year. Additional destruction by marine borers, decay by fungus growth, and annihilation by fire have made it imperative to protect wood by impregnating it at high pressure with chemicals. Preservatives which have stood the test for decades are zinc chloride and creosote. In 1942, 300,000,-000 gallons of the latter were used to preserve 4 billion feet of timber. When odor or painting qualities are objectionable, inorganic salt preservatives are used. The U.S. Department of Agriculture reported that 210,100 pounds of chromated zincchloride mixture, 83,100 tons of Waldman salts, 135 tons of zinc meta-arsenate, and 155 tons of copper sulfate-sodium-chromate mixtures were used in 1941; also, large quantities of pentachlorphene dissolved in petroleum. Kaufert and Baehr reported that concentrations of urea greater than 1 per cent completely prevented the growth of wood-rotting fungi; 40 to 100 pounds of urea per 1,000 board feet are recommended. For protecting wood further, zinc chloride or chromated zinc chloride imparts fire resistance. Resinous materials increase resistance to acids and alkalis; other resins give the wood a permanent swell, preventing subsequent shrinkage. New techniques have been introduced by duPont for hardening the softer woods, and increasing tensile strength in all directions, a most unusual property of wood. Poplar, for instance, can be made as hard as maple. New techniques have developed during the war for gluing wood members, making possible beams of 100 feet and wooden spans of 200 feet in length.

X-rays. See article on Physics.

#### FOREIGN COUNTRIES

Africa in 1938 produced 31 per cent of the world's chromium, 21 per cent of the nickel, 18 of the copper, 11 of the tin, 9 of the platinum, and 40 per cent of the vanadium. Fluorspar, asbestos, and graphite are strategic nonmetallic exports. Phosphate from North Africa, approximately 46 per cent of the world's production, is its most important nonmetallic mineral. African coal deposits, petroleum, lead, and zinc are not important. Stretching from the Belgian Congo down into Northern Rhodesia, is the largest copper region in the world. Along the Mediterranean is the ironphosphate area. A third great area produces platinum, chromite, and asbestos in the Transvaal and Southern Rhodesia. The war increased interest in the development of raw materials to supply Great Britain. This includes a plant for military chemicals in British East Africa; for power alcohol from white potatoes and maize in Southern Rhodesia; and for asbestos cement, arsenic insecticides, and tanning in Rhodesia. Belgian Congo has expanded its chemical industry in the last few years; it has an annual output of 20,000 tons of sulfuric acid, which are used to treat iron ore. About 170,000 tons of phosphates and 750,000 tons of iron ore were ready for shipment to England in the fall of 1943; in addition, Great Britain will receive zinc, lead, molybdenite and tungsten ore. South Africa is encouraging the recovering of salt by solar evapora-tion of brine; about 150,000 tons are produced from 60 salt pans in Cape Province and Orange Free State.

Argentine national industries are developing, but there is a scarcity of special machinery and technicians, for until now Argentina has devoted her efforts to the production of meat, hides, wool, and grains. The Armour Research Foundation of Chicago was commissioned to survey the economic resources and industrial development of the country, and reported its findings in Chemical and Engineering News, 1943, page 316. For some time Argentina has produced her own sulfuric acid, chiefly from imported sulfur. The country now makes electrolytic caustic soda and chlorine, anhydrous ammonia, and citrates. Plans are being made for a wood distillation plant, and a Solvay soda plant for local glass industries, wool washers and meat packers. In Argentina 32,636,000 liters of ethyl alcohol were produced in 1941 chiefly from sugar cane and molasses; but by the close of 1942 the Government contemplated large-scale production of power alcohol from surplus corn. The petroleum industry is particularly lacking in trained personnel, although the Government has erected one of the most modern petroleum research laboratories in the world.

Australian chemical industry swells under the impetus of war. Power alcohol from molasses, and phenol for a budding plastics industry, are new

items of interest.

Brazil this year has seen the birth of a number of small plants destined to increase the importance of this country in the chemical field of postwar years. Expansion of Brazilian synthetic fiber, dye, soap, and paper industries has greatly increased the demand for caustic soda; and the National Salt Institute is considering a caustic soda industry. Reputedly the largest iron reserves in the world, containing nearly 25 per cent of the world's known iron ores, are being developed for the growing steel industry to care for the United Nations' war needs. Blast furnaces, coke ovens, open hearth furnaces, rolling mills, and other equipment are being sent there by the United States. In this second year of operation, well over 200,000 tons of steel products will be realized. The Federal Government will purchase all local oil shales, is protecting the alcohol production, and has established two modern research laboratories in Pernambuco and Rio Grande de Sol for processing native ores.

and Rio Grande de Sol for processing native ores.

Canada in 1943 produced about 750,000 gallons of alcohol from 7,000,000 bushels of wheat; the manufacture of spirits for beverages has stopped entirely. The explosives program, involving a capital expenditure of some \$140,000,000, is now supplying domestic munitions plants and also provides exports. The twelve Canadian pig iron furnaces handled 2,000,000 tons in 1942. Many medicinal herbs, formerly obtained from Europe, are now being grown in British Columbia; particularly good yields have been obtained from the cascara tree. The British Columbia mercury output is twenty times the capacity of the original plant started three years ago. Linseed oil from Alberta, and flax for linen fiber, are new developments which should continue in value after the war. The paint industry is developing substitutes for tung and perilla oils. The deficiency in copra and palm oils has been met by increased production of flax. To limit expenses in the paint industry, the Government has reduced the number of colors and containers permissible. Rayon is being used in the manufacture of parachute flares and bags for propellants. There were 13,700 tons of filament and spun rayon yarns consumed in Canada in 1942. Government production of synthetic rubber has been centralized in Sarnia, Ontario, where a plant operated by Polymer Corp. Ltd. was in full production by Nov. 1, 1943. It represents an investment by the Government of approximately \$45,000,000. The styrene plant is sufficiently advanced to produce 6,000 tons per year; but the copolymer plant will depend upon the importation of butadiene from the United States. Two plants, with a total capacity of 30,000 tons of butadiene annually, are to be completed by the end of 1943. Scientists of the National Research Council have pioneered the production of butylene glycol from wheat. If all of Canada's rubber requirements were made from a wheat base, it would utilize no more than 20,000,000 of the 798,000,000 bushels of Canadian wheat in storage as of Mar. 31, 1943. Shortage of starch has led to an improved method for separating starch from the gluten fraction of wheat and flour. Sulfuric acid 66° Bé totaled 578,-474 tons in 1942, more than double the 1937 output. Dehydrated cereal grasses as poultry and dairy feed are being manufactured from British Columbian grasses. The \$35,000,000 expansion program in the nickel industry increased 1942 output 1945 out put 25,000 tons over that of 1940.

Chile extended its contract with the U.S. Metals Reserve Company until Aug. 1, 1944, which places copper ore and concentrates at our disposal; makes available manganese, tungsten, mercury, and vanadium ores; and increases the mining of zinc, lead, and cobalt ores in the Department of Ovalle. The production of coal within Chile has not satisfied industrial demand; previous to the war, Chile imported 200,000 metric tons annually from England. In Colombia, a national chemical laboratory, rep-

resenting an investment of over \$300,000, will seek to develop native products. Experts from the United States have been consulted on the development of the Colombian diet and health, and for a survey of cinchona bark for quinine. Valuable exports include chromite, mercury, zinc, quartz, and \$1,500,000 of platinum.

Czechoslovakian chemical industry was enormously stimulated by the transfer of patents from Germany. These included synthetic rubber, cell wood, lignite fuels, sulfuric acid, and insecticides. Interest increased in domestic ores such as anti-

mony and pitchblende.

Eire chemists have produced a carrageen moss emulsion as a substitute for wool oils; are testing vegetable dyes, particularly "crotol," a brown dye made from rock lichen; and have erected a carbide factory utilizing native limestone and anthracite.

English cosmetics are now made under licensing system that prohibits useless or harmful cosmetics. Fertilizer problems have been many. Although North African phosphate will increase during the coming year, imports from the United States will be reduced. The use of borax as a fertilizer to offset boron deficiency is increasing; Scottish lime will increase to well over 200,000 tons in 1943–44.

Finland, because of Germany's inability to transport and absorb her export articles, particularly timber and wood pulp, is making great effort to utilize wood in such industries as gas fuel, the manufacture of yeast, and the Wuorinen wood process. The latter converts the carbohydrates in wood into simple sugar. A new plant, erected for this process, will produce 10,000 tons of power alcohol annually, dextrose for food canning, fodder yeast for imported proteins, and lacquer for plastics.

French chemical products are under severe German control. An organization has been formed in Paris to meet the motor fuel shortage with substitutes other than power alcohol. Fat shortage is so acute that tallow has been made available for food purposes and the fatty acid content of soap has been reduced to 10 per cent. The mild climate in Alsace-Lorraine has caused German authorities to increase cultivation there of medicinal herbs, which this year total nearly 1,500 tons, six times more than in any other German province.

German efforts to operate German processes in other European countries have often proved disappointing because the processes are closely adapted to raw materials available only in Germany. Germany's fuel, rubber, and resins, for instance, are based on coal and lignite, but there are not sufficient quantities of these raw materials outside Germany to provide a surplus. Synthetic fuels in France are based on domestic shale oil; and in Italy on asphalt, where German experience is of little use. Artificial silk and cell wool in Germany is obtained from wood cellulose, but Holland, Belgium, Italy, and Spain have paid more attention to annual plants and reeds which flourish locally. Again, Finland and Sweden have found their own process for wood hydrolysis superior for their own raw materials, even though Germany possessed considerable experience in this field.

Insecticides are greatly restricted: copper sulfate is available to vine growers only; copper oxide for fungus disease, but not for spraying fruit trees; Derris root only for oleaginous plants and cabbages. Borax is available as a sugar beet and fodder fertilizer in the same quantities as last year. The fertilizer situation is very serious. Phosphate quotas were only 30 per cent of prewar allotments, now that North Africa is cut off; nitrogen fer-

tilizer is only 60 per cent, 10 per cent below 1942; lime, previously widely available, was placed on the quota basis this year for the first time; even potash, of which Germany has ample supplies, has been reduced 10 per cent. The cell wool industry is making slow progress since the cost of raw materials has increased. Leather substitutes

are usually poor.

Sulfuric acid is a serious shortage, threatened by the conquest of North Africa, which formerly supplied three-fourths of the raw material, pyrites Germans will attempt to offset this by increased production of domestic pyrites, and by recovery of sulfur from coke-oven gas and from the synthetic fuel factories. The uneconomical processing of gypsum, in particular, has again been introduced; a capacity of 80,000 tons of sulfuric acid by this

process was reported at Leverkusen.

Nazi plunder and control is aimed at an industrial empire extending even into Spain. The key organization in this exploitation of Europe is Reichwerke Hermann Goering, A-G. founded in 1937 to develop the German iron deposits. It now embraces practically every field of heavy industry including mines, machines, transportation on inland waterways, electric power resources, the light metal industries, and the artificial fiber developments. Wherever transportation becomes serious, regional arrangements have been made; thus the heavy industries of Alsace-Lorraine are utilizing the Ruhr coke.

In Hungary facilities have increased in the aluminum plant at Felsögalla. There are enlarged carbide and ferrosilicon plants, and a methane-from-sewerage unit in Budapest. Hungary continues as an important exporter of medicinal herbs, now at

a rate of 1,000 tons a year.

Indian research is sponsoring a number of new industries, including substitutions for cork and window glass; calcium carbide; urea for the plastic industry at Mysore; and formaldehyde, phosphorus, and titanium dioxide at Bangalore. A National laboratory is to be erected at Poona from contributions of Indian industrialists, particularly Tata Sons.

Mexico is increasing her production of oil-bearing seeds, chiefly sesame, cottonseed, peanuts, and castor beans. Before the fall of Singapore, Mexico im-

ported large quantities of coconut oil, New Zecland phosphate deposits of 100,000,000 tons were discovered in Clarendon. Local consumption amounts to 350,000 tons of phosphate fer-

tilizer annually.

Norwegian electrochemical and electrometallurgical industries have disappointed the German industrialists, chiefly because these industries in the prewar period increasingly relied on foreign raw materials, now cut off by the blockade. Accordingly, the German economic leaders attach greater importance to nickel, aluminum, and ferro-alloys, previously produced in small quantities, than to electrochemicals like calcium carbide and nitrogenous fertilizers which were, before the war, produced chiefly for export. Shortage of motor fuel stimulated the use of mobile producer-gas units. The development of the German cell wool process, utilizing Norway's immense wealth of wood pulp for a synthetic fiber industry, seems to await the arrival of machinery and necessary chemicals from Germany. In southern Norway, a factory is manufacturing cloth from seaweed.

Pulestine chemical plants newly erected include manufacture of solvents in Jordan, liquid ammonia and insecticides at Tel Aviv, nitric and sulfuric acids at Haifa, ethyl chloride in Jerusalem, and

lactates and lactose made from carbide in Palestine. Polish chemical raw materials are being controlled by a German Bewirtschftungstelle, which considers artificial fertilizers and tanning chemicals of prime importance, followed by soda.

Russian industrial growth over the past three decades is examined by Toplin in *Chemical and Engineering News*, 1943, p. 166. He briefly discusses their synthetic rubbers, oil-bearing areas, fertilizers from phosphates, potash deposits, and the extraordinary educational advance reflected in their scientific literature. In 1942 there were over 50,000 chemists, and 660,000 college students.

The Spanish Director General of Industry has authorized several chemical industries. A large electrochemical factory will expand its output of explosive intermediates, including ammonia, methanol, urea, acetone, and acetic acid; and a company will manufacture camphor on a scale sufficient to meet all domestic requirements, including that needed for 500,000 tons of celluloid annually. Encouragement has been given in the recovery of glycerol from fats, and oil hardening plants will begin operations soon. Efforts are being made to increase production of formaldehyde and synthetic methanol, both for domestic use, and for an expanding synthetic resin industry. Superphosphate and potash plants have been authorized, and a factory at La Feiguera will manufacture 50,000 tons of ammonium sulfate from coke-oven gas; 25,000 tons of nitrates were shipped by the United States to Spain for rehabilitation purposes. In general, progress is hampered by lack of machinery. Difficulties in exporting pyrites have stimulated interest in utilizing their arsenic and copper impurities as insecticides. The lignite deposits at Teruel and Berga and the bituminous shales of Ciudad Real may be used in distillation plants. Utilization of these mineral resources is under consideration by the Spanish National Institute of Industry. The largest pharmaceutical manufacturer in Spain, Faes, formed in 1935, employs about 400 persons and manufactures inorganic medicinals, saccharin, hexamine, acetanilide, and amidopyridine. Spain's annual supply of 10,000 tons of turpentine and 35,000 tons of colophony heretofore exported, is now being diverted into synthetic camphor, fuel, and rubber.

Sweden agreed to supply Germany this year with cellulose pulp, about 100,000 tons, during the first six months of 1943. In turn, Germany agreed to ship to Sweden 30,000 tons of soda, 30,000 tons of calcium chloride, 5,000 tons of water glass, 220,000 tons of salt, 60,000 tons of Glauber salts, 100,-000 tons of potash salts, 3,800 tons of cell wool, 1,200 tons of artificial silk, and 1,800 tons of Buna

rubber.

In general, Sweden's chemical industry has succeeded in obtaining sufficient supplies. The production of mineral acids has increased and, while the superphosphate industry has curtailed its demand for sulfuric acid, production of the latter has actually increased for use in the production of

cell wool, of sugar from wood, and in explosives.

A laboratory for testing war materials under conditions of extreme cold is to be in operation by the end of 1943. A plant to produce 6,000 tons of aluminum from Swedish andalusite has been in operation nearly a year near Sundsvall, and expansion of this aluminum company has been subsidized by the Government. A new plant for the manufacture of calcium cynamid for fertilizer will be erected in Vastergötland, but will not be completed for two or three years. The German coke process, rather than the Norwegian electrical fixation will be employed. Annual output will be about 40,000 metric tons, previously imported from Norway. Total nitrogenous fertilizer consumption in

Sweden averages 200,000 metric tons.

Many products from wood were developed to keep the Swedish cellulose plants in operation following the cessation of their enormous wood exports. Yeast from wood-pulp is being sold in Stockholm as a substitute for meat. The yeast is obtained from residual pentose sugar left when sulfite lye has been used for making alcohol. These sugars are isolated and fermented to give a white solid mass of the same consistency as ordinary yeast for baking. Capacity of the plant may reach 20,000 metric tons annually. The yeast contains 50 per cent albumen, whereas ordinary meat contains only 20 per cent. Also, several new solvents from sulfite alcohol have been produced to replace heavy naphtha and French turpentine, imports now curtailed by war conditions. New elastomers and coatings include Swedish ethyl cellulose and a polysulfide rubber produced in the Wenner-Gren Institute from the ligno-sulfonic acids in sulfite lye. Ethyl chloride is being used extensively in bleaching. Quantitatively, the manufacture of fodder cellulose was of very great importance. Expanding industries include domestic kaolin to replace the 40,000 tons formerly imported from England for paper and porcelain; 16,000 tons of edible oils, double 1942 quantities; shale oil production in Kvarntorp to double by 1944; and 12,000 tons of lead by new mining and smelting ventures. Svedberg is being provided with a factory and research laboratory near Uppsala for synthesis. thetic rubber production.

Swiss interests in plastics and elastomers are great. Local materials being utilized include coal and lignite, sand for glass, artificial cryolite, and gypsum for sulfuric acid in making fertilizer. After the war East Asia may ease Swiss loss of pharmaceutical markets in those American countries which have now established their own factories.

See the separate articles on mineral products.

CHESS. The United States Chess Federation and New York State Association combined efforts in one tournament to decide the Empire State and open titles in 1943 and when the summer gathering of experts in Syracuse had broken up both championships were in possession of Israel Horowitz of New York City. The 1942 State king won in a close duel with Anthony Santasiere. Neither lost a game, but an extra draw left Santasiere in second place. G. O. Christenson of Brooklyn won the experts' tournament and Louis Persinger of New York was first in Class A.

The Sturgis-Stephens Trophy, emblematic of the U.S. Federation amateur title, was won by Dr. Ariel Mengarini of Washington, D.C., and Reuben Fine of Washington captured the national speed championship test. Yale defeated Harvard for the H.Y.P.D. College League title and City College of New York again triumphed in the Eastern Inter-

collegiate League.

A new world record for blindfold play was set by Michael Najdorf of Poland at Rosario, Argentina, in October. Playing against 80 opponents at 40 boards, he won 36 games, lost 3, and drew in 1. THOMAS V. HANEY.

CHILDREN IN WARTIME, Commission on. See JUVENILE DELINQUENCY.

CHILDREN'S BUREAU. The activities of the Children's Bureau of the U.S. Department of Labor during 1943 centered on the development and application of policies for conserving under wartime pressures and strains the health of children in the broadest sense, their home life, educational opportunity, and community resources for their protection. Important steps were taken in the provision of maternity and infant care for wives and infants of enlisted men in the armed forces; in the development of community programs for care of children of working mothers; in the formulation of coordinated programs for the prevention and control of juvenile delinquency in wartime; and in the development of safeguards for young workers.

Other special fields of wartime activity for the Bureau included making studies, giving consultation service, and issuing reports on the policies of industrial firms toward the employment of pregnant women, the selection and training of volunteers in child care, health standards for young workers, standards for hospital care of maternity patients and newborn infants under wartime conditions, food requirements of mothers and children in relation to rationing, services for unmarried mothers, adoption of children, guardianship, homemaker service, group-work and recreation programs, the prevention and control of juvenile delinquency, the practice of holding children in jail, curfew ordinances and their social implications, and the needs of children in minority groups, especially Negroes.

On the recommendation of the Children's Bureau Commission on Children in Wartime the Bureau prepared and issued a six-point program of community action for children in wartime, a letter to parents designed to help them deal with the psychological effects of war on their children, and a community program for the prevention and control of juvenile delinquency. (See also Juvenile Delinquency.) The needs of Negro children and the health, welfare, recreation, and vocational training services available to them were given special consideration at a conference called by the Children's Bureau in December, 1943. See Ne

GROES.

Maternal and Child Health and Welfare Programs. The three programs for which the Children's Bureau carries administrative responsibility under the Social Security Act (title V, parts 1, 2, and 3) continued in operation throughout the year in the 48 States, the District of Columbia, Alaska, Hawaii, and Puerto Rico. The Bureau receives annual appropriations for grants to States under these three programs as follows: For maternal and child-health services, \$5,820,000; for services for crippled children, \$3,870,000; and for child-welfare services, \$1,510,000. Consultation service to the State agencies that administer these programs was furnished through the Bureau's regional staff, which includes physicians, nurses, medical-social consultants, nutritionists, and child-welfare consultants

Emphasis was placed in the programs for maternal and child-health services administered by

State health agencies on preventive measures and on so organizing the program as to make it possible for the limited medical and nursing personnel available under war conditions to reach the largest number of mothers and children through childhealth conferences, including immunization clinics, through prenatal and postnatal medical and nursing services, and through health supervision programs for school children.

Rapid expansion marked the program of maternity and infant care for wives and infants of en-listed men in the four lowest pay grades of the armed forces, initiated by the Bureau in 1942 in connection with maternal and child-health services. In March, 1943, for the first time the program received a separate appropriation of \$1,200,-000 to cover the remainder of the fiscal year. Appropriations amounting to \$23,000,000 were authorized for grants to State health agencies for emergency maternity and infant care during the fiscal year ending June 30, 1944. By Dec. 31, 1943, plans were in operation in all States and Territories except North Dakota and Puerto Rico and more than 161,000 cases had been accepted for care. The maternity care provided under these plans includes medical care during pregnancy, de-livery in a hospital or at home, and postnatal care. Infants may receive medical and hospital care as needed during the first year of life.

Crippled children's services were maintained in spite of the withdrawal of hundreds of surgeons, nurses, and physical therapists for war services, shortages in hospital facilities, transportation difficulties, and the scarcity of metal appliances. The number of children listed on State registers of crippled children maintained by State crippled children's agencies was approximately 354,000 as of June 30, 1943.

In connection with a campaign to educate people in the prevention and treatment of rheumatic fever in children, in which the Bureau cooperated with the Metropolitan Life Insurance Company and the American Academy of Pediatrics, a national conference on the development of State rheumatic-fever programs was held at the Children's Bureau in October, 1943. Sixteen States have developed rheumatic-fever programs as a part of their services for crippled children.

The program for child-welfare services was faced with a multiplicity of long-standing problems intensified by war conditions. Children's Bureau consultants aided State welfare agencies in planning child-welfare services for congested war areas, in developing State and local programs for care of children of working mothers, and in developing protective services for children and young people in danger of becoming delinquent. Federal funds were used to pay some 650 social workers employed in State or local child-welfare programs as of June 30, 1943. Of these workers, about 300 were in rural areas, 75 were in areas of special need, usually centers of war activity, and the remainder were on the staffs of State welfare agencies giving consultation service to local communities. Close to 41,000 children were receiving casework services through these programs in May, 1943, and many more would have been receiving service if sufficient trained personnel had been

Services for Children of Employed Mothers. The Bureau continued to give informational and advisory service on community programs for the care of children of working mothers. From August, 1942, to the end of June funds for developing programs were granted to States by the Office of Defense

Health and Welfare Services (see Federal Secur-ITY ACENCY), on the basis of plans approved by the Children's Bureau and the Office of Education, to 28 State welfare agencies and 33 State education agencies. On June 30, a bill (S. 1130) proposing the administration by the Children's Bureau of grants to State public welfare agencies for day-care services and the administration by the United States Office of Education of grants to State education departments for extended school services was passed by the Senate. This bill was still pending before the House Committee on Education in December. Since June, 1943, therefore, the only Federal funds available for programs for children of working mothers have been those administered by the Federal Works Agency under the Lanham (Community Facilities) Act. The Children's Bureau reviewed and certified need on local projects for group-care services which were referred to it by the FWA.

Safeguards for Young Workers. In July, 1943, when the number of young workers on farms was at its height, the total number of minors 14 through 17 years of age employed full time or part time was estimated at 5 millions. (See LABOR CONDITIONS.) The Children's Bureau and the Office of Education undertook a back-to-school campaign encouraging boys and girls to return to school in the fall and to regard the completion of their education as their best contribution to the war effort and to the country's postwar needs. By October the number of young workers had decreased by about 21/4 millions, leaving some 234 millions of boys and girls 14 through 17 years of age still at work. These figures do not include the many children under 14 years of age known to be at work, mostly in part-

time jobs.

The interest of the Children's Bureau, the Office of Education, and the War Manpower Commission in maintaining protective measures for young workers and in restating essential principles which should govern their employment in wartime, led to the issuance in 1943 of three statements of policy. In general these policies call for observance of State and Federal labor standards; a minimum age of 14 years for either full-time or part-time employment, 16 years for employment in manufacturing occupations, and 18 years for hazardous work; a maximum 8-hour day, 48-hour week, and 6-day week for minors under 18 with certain safeguarded exemptions; limitations on part-time and vacation employment of school youth under 18; payment of the same wages paid to adults for similar job performance; and safeguards for children employed in agriculture, especially if living away from home.

Administration of Fair Labor Standards Act. The Bureau administers the child-labor provisions of the Fair Labor Standards Act of 1938 which set a basic minimum age of 16 years for employment in or about establishments producing goods for interstate commerce and 18 years in occupations found to be particularly hazardous. No new hazardous-occupations orders were issued during the year. The Bureau issued a series of advis-ory standards, not having the force of law, intended to guide employers in war industries in selecting occupations suitable for young workers. The industries covered are shipbuilding, lead and lead-using industries, employment involving exposure to carbon disulfide and to chlorinated solvents, welding occupations, operation of metalworking machines, and the aircraft industry.

The cooperative administrative system developed by the Children's Bureau to prevent childlabor violations and protect employers—Federal-State agreements whereby State employment and age certificates are accepted as proof of age under the act—was continued in 44 States, the District of Columbia, Hawaii, and Puerto Rico. In 4 States where there is no State system of employment-certificate issuance, the Bureau issued Federal certificates. Regional child-labor consultants on the Bureau staff are responsible for the general development and coordination of age-certificate and inspection programs, including cooperation with the regional staff of the Wage and Hour Division of the Department of Labor and with State labor and education agencies.

The strain placed on State facilities and staffs by the large numbers of boys and girls flocking into the labor market has been very great. Employment certificates issued for full or part-time employment of minors 14 through 17 years of age in June, 1943, for example, were more than double the number issued in June, 1942, totals in some localities riging to 4 or 5 times the 1942 figure

localities rising to 4 or 5 times the 1942 figure. This Federal law, as well as State child-labor legislation, undoubtedly checked to some extent the unwise exodus from school of children under 16 and helped to withstand the increasing pressure to break down standards for child and youth employment. However, the illegal as well as the legal employment of children increased. Inspection cases under the Federal act closed during the fiscal year 1943 disclosed 1,722 establishments in violation of the child-labor provisions, an increase of 33 per cent over 1942 and 197 per cent over 1941. The number of minors found in illegal employment in 1943 was 4,567, an increase of 12 per cent over 1942 and 159 per cent over 1941. Of these children, 800 were under 14.

Although the Bureau has consistently sought to bring about, through educational means, compliance of employers with child-labor provisions of the Fair Labor Standards Act the number of legal actions instituted because of persistent violations

has gradually increased.

International Cooperation. The Children's Bureau participated in the program of inter-American cooperation developed by an interdepartmental committee under the auspices of the Department of State by furnishing consultation service on re-quest to the American International Institute for the Protection of Childhood and to the Governments of several American Republics. The Council of the Institute met at the headquarters of the Institute in Montevideo, Uruguay, in May, 1943, with the Chief of the Children's Bureau representing the United States, to consider preliminary reports on nutritional problems of the children of the Americas and to act on proposals for reorganization of the Institute. The Republics where consultation service was given by the Bureau to official agencies concerned with child health and welfare were as follows: Bolivia, Brazil, Chile, Costa Rica, the Dominican Republic, Ecuador, Mexico, Paraguay, Uruguay, and Peru. Several of the Children's Bureau bulletins for parents were translated into Spanish and Portuguese by the State Department for distribution in other American countries

At the request of the Office of Foreign Relief and Rehabilitation Operations (q.v.) the Children's Bureau provided informational and advisory service on the needs of children and on prewar facilities for child care in areas occupied by enemy forces for use in planning for food, shelter, clothing, medical care, and other essential services for children in liberated areas. A member of the Bureau staff served on the Technical Secretariat for the United Nations Conference on Food and Agriculture held in Hot Springs, Va., in May, and acted as secretary of the committee dealing with consumption levels and requirements. This Conference gave clear recognition to the obligation of governments to meet the special needs of "vulnerable groups," including infants, children, and pregnant and nursing women.

CHILE. A South American republic. Capital, Santiago.

Area and Population. Area, 286,396 square miles; estimated population in 1942, 5,178,260 (4,287,-445 at 1930 census). Chileans of the upper and middle classes are predominantly of European (chiefly Spanish) origin, but there is a considerable Indian strain in the lower class. The settlement of southern Chile was done mainly by German immigrants. The 105,463 aliens living in Chile at the 1930 census included 23,439 Spaniards, 11,070 Italians, and 10,861 Germans. In 1941 there were about 1,281 United States citizens and 5,300 British subjects in residence. Estimated populations of the chief cities in 1941 were: Santiago, 639,546; Valparaíso, 245,000 (including suburbs); Concepción, 77,658; Antofagasta, 60,000; Viña del Mar, 50,000; Iquique, 46,000; Talca, 45,000; Chillán, 39,500.

Defense. Under the compulsory military service system, all youths of 20 are called to the colors, mostly for nine months, and then serve in the reserve until 45. As of Jan. 1, 1941, the active army numbered 40,915 (including some 20,000 regulars) and trained reserves 212,000; active air force, 1,912 men, with over 100 airplanes. The active army was expanded and supplied with some new equipment from the United States during 1942. The navy comprises 1 battleship, 3 cruisers, 8 large destroyers, 9 submarines, and various auxiliary vessels, manned by about 8,000 men in all. A United States military aviation mission was engaged in 1940 (see History).

Education and Religion. Elementary education is compulsory, but about 25 per cent of all adults remain illiterate. In 1940 there were estimated to be 900,000 children of school age, of whom 583,664 were enrolled in public schools and 90,595 in 834 private schools. Of the private schools, 657 received state aid. The five universities had 6,448 students in 1939. Roman Catholicism is professed by the great majority of Chileans, but the Church

was disestablished in 1925.

Production. At the 1930 census, \$7.8 per cent of the working population was engaged in agriculture and 22.1 per cent in industry and mining. Estimated yields of the chief crops in 1942–43 were (in metric tons): Wheat, \$53,629; oats, 77,084; rye, 6,278; forage barley, 40,063; malting barley, 30,865; beans, 76,615; potatoes, 477,997; tobacco, 6,500. The 1942 hemp crop was 14,635 metric tons. Lentils, peas, corn, and rice are widely grown. The 1941 wine yield was 2,416,117 hectoliters (hectoliter equals 26.42 U.S. gal.). A total of 1,152,306 sheep carcasses were processed at the

freezing plants in 1942. Wool clip in 1939, 13,600 metric tons.

Mineral production was (metric tons): Nitrate, 1,408,491 in 1941; copper, 37,794 in 1941; iron ore (exports only), 1,621,692 in 1941; manganese, 21,400 in 1941 (exports only); coal, 2,148,000 in 1942; cement, 360,000 in 1942. Gold output in 1942, 5,826,800 fine grams, about one-half of the peak production of 1939 and 1940. The mining industry had an average of 63,181 workers in 1940; lumbering, 14,611. There were about 5,585 industrial establishments, with a total of 296,200 employees.

Foreign Trade. Merchandise imports in 1942 were valued at 621,480,000 gold pesos (524,880,000 in 1941); exports, 861,840,000 gold pesos (767,880,000 in 1941). For the leading items and distribution of trade by countries in 1941, see 1943 YEAR BOOK. Exports to the United States in 1942 were 50 per cent higher than in 1940 while exports to Latin American countries advanced nearly 200 per cent

Finance. Estimated 1943 budget receipts and expenditures balanced at 3,186,000,000 pesos, including loans. The Comptroller General reported that actual revenues in 1942 were 2,954,000,000 and expenditures 3,052,000,000 pesos; budget deficit, 98,000,000 pesos (265,100,000 in 1941). The accumulated deficit on Dec. 31, 1942, was 675,500,000 pesos. Direct public debt on Dec. 31, 1942,4,968,000,000 pesos, divided as follows (in millions of pesos): External, 1,898; internal, 2,111; banking advances, 323; port-works obligations, 21; obligations of Reconstruction and Development Corporations, 615. In addition there was a government-guaranteed debt of 1,278,000,000 pesos (internal, 460,000,000; external, 818,000,000).

The peso of sixpence gold is used only for certain statistical purposes. Official exchange rate of the Chilean peso during 1941–43, \$0.0516; export draft rate, \$0.0400; free rate, about \$0.0323.

Transportation. Chile in 1942 had over 5,500 miles of railway line (over 3,637 miles owned by the state), some 27,000 miles of roads and highways, and national and international air services connecting the principal cities. Under construction in 1943 were a trans-Andean railway from Antofagasta, Chile, to Salta, Argentina, and a modern highway between Santiago and Concepción. On June 30, 1940, Chile had a merchant marine consisting of 106 vessels of 160,232 tons gross. The U.S. Government in 1943 purchased Chile's three largest steamers for \$2,000,000 each. To replace them until the end of the war, it leased four 8,000-ton merchantmen to the Chilean-owned South American Steamship Co.

-Government. The Constitution of Oct. 18, 1925, vested executive powers in a President, elected by popular vote for six years and ineligible to succeed himself, and legislative powers in a popularly elected Congress consisting of a Senate of 45 members serving for eight years and a Chamber of Deputies of 147 members serving four years. President, Juan Antonio Rios, who assumed office Apr. 3, 1942, following his election on Feb. 1, 1942, by a coalition of Leftist parties. As a result of the elections of March, 1941, the Chamber of Deputies was divided into two blocs, as follows: Leftists, 85 (Radicals, 44; Socialists, 15; Communists, 15; Democratic, 9; Workers, 2), and Rightists, 62 (Conservatives, 32; Liberals, 22; Falangists, 3; Agrarians, 3; Vanguardists, 2). The Cabinet appointed Oct. 21, 1942, consisted of 6 Radicals, 3 Socialists, 1 Democrat, and 3 non-party men. For 1943 developments, see below.

#### HISTORY

Break with Axis. The long controversy over Chile's neutrality policy, arising from its failure to carry out the recommendations of the Rio de Janeiro Conference of American Foreign Ministers, ended on Jan. 20, 1943, when President Rios announced the severance of diplomatic and commercial relations with Germany, Italy, and Japan (see 1943 Year Book, p. 133, for background). The breaking off of diplomatic and consular relations with Vichy France, Bulgaria, Hungary, and Rumania followed on May 18.

At the insistence of the President, Chile had delayed action to abandon neutrality until the danger of adverse internal and external repercussions had been banished and every practical advantage had been derived. American naval victories in the Pacific had eliminated the danger of Japanese naval attacks upon the exposed Chilean coast. Pledges of U.S. lend-lease and economic aid had been obtained by Minister of Interior Raúl Morales Beltramí during his special mission to Washington in December. On his return trip to Santiago, Dr. Morales stopped at Buenos Aires for a long conference with the President and Foreign Minister of Argentina. Informing them in advance, in friendly terms, of Chile's decision to break with the Axis, he made possible the continuance of close Argentine-Chilean economic and political collaboration, despite the divergence of their foreign policies.

Soon after Morales returned to Chile on Jan. 5, 1943, the Chilean Senate in a secret session on January 19 approved a motion to end relations with the Axis powers by a vote of 30 to 10, with two members abstaining. The Government's decree carrying out this decision was issued the following day. In announcing this action over the radio, President Rios explained that the move was "strictly diplomatic" and not directed against the peoples of the Axis countries, to whom Chile owed much of her progress. His circumspection largely overcame the opposition of powerful groups within Chile to the abandonment of neutrality. The bulk of the press and some of the leaders of the Rightist opposition rallied behind the new policy. Anti-Axis elements expressed their joyous approval in a huge demonstration held in the capital on January 277.

Prompt and effective action by the Minister of Interior minimized the danger of subversive activities by pro-Axis sympathizers among the 20,000 Germans, 12,000 Italians, and 700 Japanese living in Chile. More than 300 ringleaders of the German Nazi and Japanese colonies were forced to take up residence in small towns in isolated parts of Chile where they were unable to direct or engage in sabotage or espionage. Among them were the manager of the German Transocean news agency and the head of the Bayer Chemical Co. German centers in Santiago and other cities were raided and the principal Axis radio station and propaganda organs forced to suspend by one means or another. The Santiago police discovered four large bombs hidden in a telephone sub-station alongside of an army ordinance plant, but otherwise little difficulty was experienced in keeping pro-Axis sympathizers under control.

sympathizers under control.

Soon after Chile broke off relations, an official Japanese spokesman in Tokyo declared that Chile was "fully responsible for the consequences." He warned that Chile could no longer count on "considerate treatment" of her shipping by the Axis and that she was "voluntarily renouncing her leading position in shipping on the Pacific Coast of

South America." These thinly veiled threats were followed by the arrest of the Chilean Minister in Tokyo. Chile retaliated promptly by locking up the Japanese Minister and 25 members of his staff in the Japanese Legation in Santiago and refusing to permit them to communicate with the outside world. This move was understood to have been effective in securing proper treatment for the Chilean envoy and his staff in Japan.

Relations with United States. Chile's break with the Axis was followed by the extension of further U.S. economic and military aid and by a period of close political collaboration. Two weeks after the break the Chilean Minister of Economy announced the conclusion of an agreement for the purchase and immediate shipment to Chile of two U.S. industrial plants made idle by the war production program. One was the copper plant of the General Cable Co., Pawtucket, R.I., suitable for the production of copper wire and plates, both badly needed for the furtherance of Chile's industrialization program. The other was a steel plant owned by the Worth Steel Co., Claymont, Del., with a capacity of 30,000 tons annually. Combined with Chile's existing steel mills, this plant was expected to supply the country's normal needs and permit a start on the long-discussed naval construction pro-

A lend-lease agreement, under which the U.S. Government undertook to supply Chile with military equipment of unspecified value, was signed in Washington March 2. Soon afterward Gen. Oscar Escudero Otarola, commander in chief of the Chilean Army, went to the United States to arrange details of the equipment that Chile was to receive. The agreement under which the U.S. sent a military aviation mission to Chile in 1940 was extended for another three years through an exchange of notes between the State Department and the Chilean Ambassador in Washington on

April 14. Meanwhile Vice President Henry Wallace had received an extremely cordial welcome during his goodwill tour of Chile in late March and early April, During his visit the U.S. Embassy in San-tiago announced March 29 that Chile had been granted priorities for the purchase of machine tools and machinery needed for the construction of hydroelectric plants on the Cachapoal and Laja rivers in southern Chile. While in Chile, Wallace visited the copper mining districts in the north, where the U.S. Defense Plant Corporation, a subsidiary of the Reconstruction Finance Corporation, had invested \$20,000,000 in plants for the expansion of copper production.

In June the U.S. Metals Reserve Co. agreed to an upward revision for one year of the contract price fixed in February, 1942, for the purchase of Chilean ores and concentrates of copper and gold, of manganese ore, and certain other strategic metals. There was no change in the price of metallic copper, comprising the bulk of the Chilean production. The U.S. Government agreed to facilitate shipments of new machinery for the Chilean mines and of coal for smelting low-grade copper ores, in return for Chile's promise to open up at least one additional copper smelter.

Vice President Wallace invited President Rios to make the official visit to the United States which he canceled in 1942 following criticism of Chile's neutrality policy by Under-Secretary of State Sumner Welles (see 1943 Year Book). Rios accepted the invitation for June, but political developments in Chile later led him to postpone the trip until 1944. However the Chilean Foreign

Minister, Dr. Joaquín Fernández y Fernández, visited Washington late in September for conferences with high U.S. officials and legislators on Chilean— United States problems.

Other Foreign Relations. Negotiations for closer economic cooperation between Chile and Argentina made further progress during 1943. In mid-April a ten-year contract was signed for the purchase by Argentina of large quantities of natural nitrates and 25 to 30 tons of iodine. Argentina agreed not to manufacture synthetic nitrates during the life of the agreement and not to reexport the

Chilean nitrates or iodine.

Late in August the Chilean Foreign Minister stopped in Buenos Aires en route home from the inauguration of President Morinigo of Paraguay and signed important accords. They provided for joint Argentine-Chilean action to speed completion of the Salta-Antofagasta railway and new highways between the two countries and to reopen the Transandine Railway, blocked by a landslide several years before. The accords also eliminated customs duties on a number of articles exchanged by the two republics, and set up permanent commissions to study the feasibility of further progress toward a customs union.

A shadow was cast over Argentine-Chilean friendship later in the year as a result of the antidemocratic measures of the Ramírez dictatorship (see Arcentina under *History*). There were numerous protests from Chilean leaders and prodemocratic organizations, and demonstrations of solidarity with democratic forces in Argentina.

A marked coolness developed between the Bolivian and Chilean Governments due to the revival by Bolivian officials and newspapers of the longstanding demand for a Bolivian outlet on the Pacific. The Bolivians seized upon Vice President Wallace's visit to La Paz in April as an opportune time for raising the issue of a Pacific port. Bolivia's simultaneous declaration of war against the Axis on April 7 was viewed in Chile as an effort to enlist U.S. support for the Bolivian claim, and hence was received with little enthusiasm. The Chilean Government declined to consider a revision of its existing territorial boundaries. See Bo-LIVIA under History.

Internal Politics. Continued partisan bickering in Congress and quarreling within and among the political parties supporting the Rios administration delayed the Government's legislative program for meeting the war-induced economic crisis and caused frequent reorganizations of the Cabinet. Meanwhile a Communist-sponsored movement for the unification of the Communist, Socialist, and Socialist-Labor parties into a single powerful labor

party made substantial progress.

A split within the Socialist party led to the resignation of the three Socialist members of the Cabinet on February 3. They were replaced the following day by two Liberals and a Radical. Later another schism occurred within President Rios's own Radical party. When a new session of Congress convened on May 21, the President in his annual message appealed for an end to intra-party quarrels. Nevertheless Minister of Interior Morales resigned on June 7 and the whole Cabinet followed suit in the customary gesture of solidarity. Morales, who was also a Radical, resigned because of "attacks from members of my own party." President Rios immediately called off his impending trip to the United States.

Affirming his conviction that Morales had been the victim of partisan politics, Rios accepted the Cabinet's resignation and replaced it with a min-

istry of nonparty experts, who agreed to perform their duties without regard to political considera-tions. The new Cabinet included Vice Admiral Julio Allard Pinto, commander in chief of the navy, as Minister of Interior, Major General Escudero, commander in chief of the army, as Minister of National Defense, and Joaquín Fernández y Fernández as Foreign Minister. President Rios appropried that party leaders would not be read and provinced that party leaders would not be read. announced that party leaders would not be readmitted to the Cabinet until they had demonstrated their readiness to put the national welfare above party and personal interests.

This maneuver failed to force the Congressional leaders into line. In mid-June they declined to approve the emergency powers he had requested in order to curb widespread speculation and mounting inflation. A month later they killed in committee a constitutional amendment sponsored by the President, which would have transferred from Congress to the Chief Executive the power to initiate public works programs and create new government jobs. Rios appointed Ramón Vergara Montero, former mayor of Santiago, as economic czar. But the latter's drastic efforts at price control and the elimination of speculation were not overly

effective.

Another reorganization of the Cabinet was forced upon the President at the end of August as a result of the decision of the Socialist party convention to decline further participation in the Government. The Communists had all along refused participation in any government which they did not control. This left Rios with only the support of the Radicals and minor Leftist groups. Since the President was opposed to governing on a largely one-party basis, he revised his Cabinet on August 31 to include both Radicals and members of the opposition Liberal party. Six of the nonparty experts in the former Cabinet were retained. The other seven portfolios were distributed among

Radical and Liberal party leaders.

When the Congressional session expired on Sep tember 17 without adoption of the President's emergency economic program, he immediately called the members into special session and placed upon their shoulders the responsibility for finding an answer to the country's immediate economic problems. The general cost of living index (Base: March 1928 = 100) had risen from an average of 186 for 1939 to 242 in 1941 and 332.4 in December, 1942. Meanwhile, with the not inconsiderable powers at its disposal, the Government laid plans for the expansion of economic production. On October 25, it announced an 18-year program for the electrification of the whole country by harnessing the waterpower of the principal rivers. The development of low-cost hydroelectric power for the expansion of industry was to be carried out in three stages of six years each at a total cost of about \$100,000,000.

War.

## RONALD STUART KAIN.

CHINA. A republic of eastern Asia. Provisional capital, Chungking. Nanking, the former capital, was captured by the Japanese in December, 1937, and Hankow, to which most of the Chinese Ministries were then transferred, fell in October, 1938.

Area and Population. Including the nominal dependencies of Sinkiang (Chinese Turkestan), Outer Mongolia (see Mongolia), and Tibet

(q.v.), over which the Central Government exercised little or no actual control, and the former Chinese Provinces incorporated in the Japanese protectorate of Manchukuo (q.v.), China has an area estimated by the Ministry of the Interior in 1937 at 7,226,365 square miles, of which 2,279,184 square miles are included in China Proper, with a total population of 466,785,856. For the estimated area and population of the provinces and dependencies, see 1942 Year Book, p. 118. A 1940 estimate placed the total population at 450,000,000.

According to a 1943 estimate, the actual area under Japan's nominal control (excluding Manchuria) was roughly 440,000 square miles with a population of 200,000,000. The National Government at Chungking remained in control of nearly 4,000,000 square miles with a population of some 260,000,000. To escape Japanese rule, about 40,-000,000 Chinese migrated from the densely populated coastal plains to the mountains of Szechwan, Yunnan and the northwest between 1937 and 1943. There were estimated to be 7,828,888 Chinese residing abroad in 1936. The Japanese civilian population of China on Jan. 1, 1940, was 345,700, an increase of 300 per cent since July, 1937. As of July 17, 1942, Japanese estimates placed the Japanese civilian population of Central China at 145,-900, including more than 100,000 in Shanghai, 13,000 in Nanking, 11,000 in Hankow, and 2,800 in Hangchow.

The estimated population of Shanghai and its environs in 1936 was 3,489,998 including 1,450,-685 persons in the Foreign Settlements; Peiping, capital of China until 1928, 1,556,364; Tientsin, 1,292,025; Nanking, 1,019,948; Tsingtao, 514,769. Estimated populations of the other chief cities in 1931 were: Canton, 861,024; Hankow (including Wuchang and Hanyang), 777,993; Chungking, 635,000; Wenchow, 631,276; Changsha, 606,972; Hangchow, 606,930; Weihaiwei, 390,337; Foo-chow, 322,725; Soochow, 260,000; Amoy, 234,159; Ningpo, 218,774; Wanhsien, 201,937; Chinkiang,

199,776.

Education. Between 25 and 50 per cent of the population were estimated to be literate in 1937, compared with an estimated 15 per cent in 1912. By August, 1940, when the five-year program was launched, the number of illiterate adults between 15 and 45 to receive schooling was approximately 140,000,000 and of children between 6 and 15 the number was 53,101,531. At the outbreak of the Chino-Japanese war in 1937 there were 294,-141 primary schools and kindergartens with 16,-629,644 pupils, 3,264 middle schools with 571,820 pupils, and 108 institutions of higher learning with 41,922 students. By 1939 the Japanese invasion was estimated to have closed 129,771 primary schools and kindergartens with an enrollment of 6,483,481 pupils, 1,296 middle schools with 250,-453 pupils, and institutions of higher learning with 20,000 students. The Peiping Union Medical College, largest medical center in the Orient, was closed by the Japanese on Feb. 1, 1942. Up to October, 1939, no less than 39 of the closed universities had reopened in the western unoccupied provinces, where numerous secondary schools were likewise established. Enrollment in 115 universities in West China was estimated at over 45,000 in 1941-42; in middle schools, more than 600,000.

Religion. With the exception of Christians and Mohammedans, most Chinese practise and profess all three indigenous or adopted religions—Confucianism, Buddhism, and Taoism. The Mohammedans are estimated at over 48,000,000. In 1934 there were 2,623,560 native Roman Catholics and 123 Catholic missions, with a staff of 16,241. The Protestant churches, with 1,130 mission stations and 488,539 communicants in 1932, had 19 colleges, 267 middle schools, and 37,714 students in 1934. The number of Christian missionaries in China declined from nearly 6,000 in 1937 to about 3,600 on June 30, 1941. Of those remaining, many were expelled or imprisoned after Japan attacked the Anglo-American and other powers.

Production. Previous to the outbreak of Chino-Japanese hostilities in 1937, China was the world's leading producer of rice, soybeans, tea, kaoliang, sweet potatoes, millet, and vegetable oils; it ranked second in the output of raw silk and wheat; third in cotton, and was an important producer of corn, tobacco, fruits and vegetables, and cane sugar, as well as the leading exporter of eggs and tung oil. Estimated production of rough rice in 1940–41 was 2,440,000,000 bu. (34,277,000 metric tons in Free China in 1942); wheat in 1941, 19,440,000 metric tons (preliminary); cotton in 1941, 2,406,000 bales (of 478 lb.) including Manchuria; flueured tobacco in 1941, 85,000,000 lb.; rape-seed in 1940, 2,507,000 metric tons; raw silk in 1940, 107,430 picul bales (of 132½ lb.). Tea production is estimated at 300,000 to 500,000 metric tons annually; tung oil, 140,000 tons. The wool and mohair clip for China and Manchukuo was about 55,000 metric tons in 1940.

The estimated mineral output of all China, excluding Manchukuo, in 1940 was (in metric tons except as stated): Coal, 17,828,711; antimony, 7,418; tin ingots and slabs, 23,361; tungsten ore, 11,580; white alum, 21,000; arsenic, 1,200; coke, 50,430; copper ore, 1,100; gold, 377,000 fine oz.; gypsum, 75,000; iron ore, 551,000; pig iron, 107,000; lead ore, 1,800; crude petroleum, 440,000 U.S. gal.; potash, 3,317; quicksilver, 118; rock salt, 926,716; refined salt, 18,837. The mineral production of Free China in 1941 was reported as follows (in tons): Tungsten, 11,500; antimony, 7,600; fine tin, 7,000; mercury, 120; coal, 6,000,000. The 1941 output of petroleum from the new Kansu fields was 3,630,000 gal.; of foundry iron, 10,000 tons.

was 3,630,000 gal.; of foundry iron, 10,000 tons. The war disrupted China's rapidly expanding manufacturing industry (see Year Book, 1937, p. 152), but there followed a considerable transfer of plants to the free provinces in the west. At the beginning of 1943 there were 1,915 private factories in West China employing 30 or more workers each, and using mechanized power for production. According to official Chinese reports, there were 87 metallurgical works, 376 units of machine works, 44 electrical plants, 380 chemical works, 273 textile mills, 3 cement plants, 133 alcohol factories, 17 paper mills, 42 oil refineries, 1,629 coal mining units, and 122 iron mining units.

Trade and Finance. See 1943 YEAR BOOK for latest available data.

Transportation. All railways in occupied China are operated by two semi-official Japanese companies, the North China Communications Co. (operating 4,089 miles of line on Jan. 1, 1941) and the Central China Communications Co. (operating 1,230 miles of line in central and south China on Jan. 1, 1940). There were reported to be 2,285 miles of railway line in Free China as of Aug. 1, 1939, but many of these lines were torn up to prevent Japanese advances or closed down for other reasons. The principal railways reported to be in operation in Free China in 1943 were Hengyang-Liuchow-Kweiyang, Kunming-Suanwei, Kunming-Mengtze-Shihping, Loyang-Tienshui, Hsienyang-Tungkuan, and Chungking-Neikiang. Other important lines were reported under construction.

Highways in all China extended over 61,430 miles in 1940. Much new construction took place in both Free and occupied zones during 1940–43. The ferry command of the U.S. Army Air Forces accounted for the bulk of the air traffic to and from Free China during 1943, its transport planes operating from both India and from Alaska via Soviet Siberia. The China National Aviation Corp., a Chinese-American enterprise, maintained air transport services between Chungking and Calcutta. There was a Chungking-Moscow air line, operated jointly by the Chinese and Soviet Governments. Japanese air transport routes in China on Jan. 1, 1941, extended 5,154 miles, connecting the chief cities of the occupied areas. During 1940, 91,891 vessels of 25,675,594 tons entered and cleared Chinese ports in the overseas trade.

Government. The Organic Law of Oct. 4, 1928, revised on Dec. 29, 1931, and Dec. 27, 1932, vested the supreme governing powers of the Chinese Nationalist Government in the National Congress of the Kuomintang (Nationalist party), acting through the Central Executive Committee, the Central Supervisory Committee, and the Central Political Council. Executive control, however, centered mainly in the hands of Gen. Chiang Kai-shek, commander-in-chief of the Nationalist armies. After the outbreak of hostilities with Japan in 1937, a Supreme National Defense Council, headed by Chiang Kai-shek, assumed direction of all political and military affairs. It included the heads of all party, political and military organs together with other members nominated by the chairman and approved by the Council See History.

proved by the Council. See History.

The chairman of the State Council and nominal head of the government in 1942 was Lin Sen. The chairmen of the five yuan (committees) of the government were: Executive, Gen. Chiang Kaishek, assisted by Dr. H. H. Kung as vice-chairman; Legislative, Sun Fo; Judicial, Chu Cheng; Examination, Tai Chi-tao; Control, Yu Yu-jen. Under the chairman of the Executive Yuan were nine ministries, headed as follows: Interior, Chow Chungyou; Foreign Affairs, T. V. Soong; Military Affairs, Gen. Ho Ying-chin; Finance, Dr. H. H. Kung; National Economy, Dr. Wang Wen-hao; Communications, Tseng Yang-fu; Education, Chen Li-fu; Agriculture and Forestry, Adm. Shen Hunglai; Social Affairs, Ku Cheng-kan; Information, Chang Tao-fan. Attached to the Executive Yuan are three subordinate Commissions, supervising Mongolian and Tibetan Affairs, Overseas Chinese Affairs, and Famine Relief. See History.

On Mar. 22, 1940, the Japanese established a puppet government at Nanking headed by Wang Ching-wei as Acting President and President of the Executive Yuan. Other puppet governments were established at Peiping and Canton, as well as in Manchuria and Inner Mongolia (see Manchurkuo, Mongolia).

The Japanese invasion of China proper began July 7, 1937, without formal declaration of war. After the Japanese attack on Pearl Harbor, the Chinese Government declared a state of war with Japan, Italy, and Germany as from Dec. 9, 1941.

#### HISTORY

Military Developments. China's military situation, despite another Japanese drive into the "rice bowl" area of the central Yangtze Valley provinces and also into western Yunnan on the Burma frontier, did not change materially in 1943. The renewed fighting in Central China which began in November and continued practically to the end of the year represented Japan's fourth attempt to capture

the strategic city of Changsha, located on the Hankow-Canton Railway to the southwest of Hankow. The Japanese succeeded in occupying the walled city of Changteh, northeast of Changsha, but were forced to withdraw. The fighting at Changteh was described as the most serious that had taken place since the sanguinary battle for Shanghai in 1937. Possession of strategically-located Changsha with its airfield would place the Japanese within striking distance of Chungking, the capital of Free China and at the same time probably would enable Japan to open the railway to Canton, both of which have constituted major Japanese objectives since the beginning of the invasion of China proper in 1937.

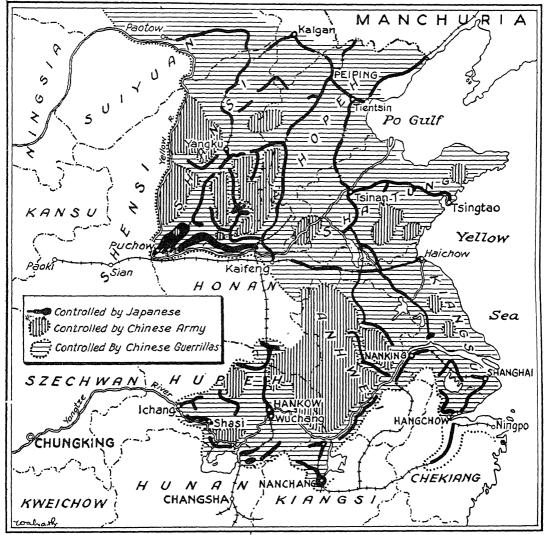

China's repeated charge that the Japanese were using poison gas in the fighting in Central China received confirmation, from the standpoint of tear and sneeze gas, in statements of Japanese prisoners taken captive in the fighting in the "rice bowl" district. The prisoners said that Japanese units in Central China are equipped to use deadly blister

and suffocating gas but denied they had ever witnessed the use of these gasses. Both President Roosevelt and Prime Minister Churchill had re-peatedly warned the Japanese and Germans that the Allies would retaliate in kind and full measure

against the use of gas by the enemy.

Japan and the Chinese Railways. Japan's inability to obtain military control of the Chinese railways passing through Central China in a north-south direction, connecting Peiping and Hankow, Hankow and Canton, and Shanghai and Canton constituted a serious if not irreparable blow to Japanese military strategy. The Japanese Army counted on the control of China's few trunk-line railways in order to facilitate troop movements and military supplies in a generally roadless country, and in addition they hoped that railway revenues would reimburse them for the cost of their China adventure.

Aside from the railways of Manchuria, the Japanese only obtained control of the 800-mile line connecting Peiping-Tientsin and Shanghai but even

## CHINA AFTER SIX YEARS OF WAR

The map, prepared in July, 1943, from information supplied by the Chinese Military Mission to the United States, shows the limited areas in North and Central China then under effective Japanese control.

this line, lying wholly within Japanese-occupied territory, was made uncertain and unprofitable due to the depredations of Chinese guerrillas.

As a result the Japanese had to depend on river and ocean-going transport which became a chief target for the American and Chinese air forces operating from bases in south-central and southwest China. Bombing raids by the U.S. 14th Air Force and its Chinese-American wing on Japanese lines of communication, supply bases, and shipping at Hankow and along the Yangtze, plus the actual strafing of Japanese troop concentrations, were credited with a large measure of responsibility for the latest Japanese defeats in Central China.

Targets for Chinese-American Fliers. Reports from the Chinese front in the last quarter of the year indicated growing activity on the part of the American and Chinese-American air forces, extending not only to Japanese shipping installations along the coast from Shanghai to Canton but even to Formosa, presaging eventual bombings of Japan proper. Japanese shipping and military installations at practically every important city on the Yangtze from Ichang to Shanghai served as targets for American and Chinese fliers. The only important city which had escaped bombing was Shanghai and this was due to Japan's action in locating detention camps containing large numbers of American, British, and other United Nations war prisoners in close proximity to Japanese military and shipping installations.

Japanese shipping and dockyards at Hong Kong particularly provided a special target for American and Chinese airmen, especially the extensive docks at Kowloon and Taikoo which the Japanese seized from the British. The large oil installations formerly owned by the Anglo-American oil companies, which the Japanese also took over following the occupation of the British Colony, served as special targets for the American and Chinese airmen. In one air raid on Tungting Lake in Central China the American and Chinese airmen strafed and destroyed some 200 small Japanese landing boats, each carrying from two to a half-dozen Japanese soldiers. The destruction of Japanese shipping on the Yangtze and along the coast was so extensive that the Japanese experienced severe difficulties in supplying food and fuel to the inhabitants of cities within

areas occupied by the Japanese Army.

The Japanese on August 23 attempted an airraid on Chungking, their first in nearly two years, but little damage resulted. The raid was in retaliation for an American raid on Hankow which had resulted in 39 Japanese planes being shot down.

The importance of the China front from the standpoint of American and Allied strategy was emphasized by Adm. Ernest J. King, Commander in Chief of the U.S. Fleet, in an interview with the Associated Press in August. He said that China's position in respect to Japan was analogous to that held by Russia in respect to Germany. "The key to final victory over Japan lies in China," he declared.

American Preparations. American military activity against Japan on the Asiatic Continent during the year was concerned largely with the up-building of the U.S. 14th Air Force in China, plus the training of a Chinese air force and the development of the Tenth U.S. Air Force in India, plus the training and equipping of a large Chinese land force for service in ejecting the Japanese from Burma in order that land communications between northeastern India and China may be reestablished.

In view of the importance of China in Allied global strategy, it was realized that Japan would

concentrate her best forces on that front. The struggle was mainly concerned, from the American standpoint, in developing and fortifying air bases south of the Yangtze to permit easy bombing of Japan. The magnitude of the problem was indicated by the fact that all supplies, including gasoline and repair equipment, had to be flown into China over the Himalayas by transport plane. This monumental work was done by U.S. Army transport planes and the planes of the China National Aviation Corporation, an American-Chinese concern.

The commanders of the two major American enterprises on the Continent were Maj. Gen. Claire L. Chennault of the 14th Air Force in China, and Lieut. Gen. Joseph W. Stilwell, commander of U.S. land forces in China, Burma and India, who is attached to the headquarters of Generalissimo Chiang Kai-shek on the northern India front.

According to a report in August, General Chennault's forces in the first 13 months of his command shot down 306 Japanese planes against a loss of 39 on the American side. The Pursuit Group, which took over from the American Volunteer Group (Flying Tigers) in March, 1943, had a record of 252 Japanese planes downed to 37 American, a ratio of 7 to 1. In addition to this, 139 Jap planes were destroyed on the ground against 5 American while the number of Jap planes probably downed had reached 66.

New Chinese Army for Burma Front. Land fighting on the Burma front between Chinese and Japanese forces was largely confined to the west bank of the Salween River which roughly parallels the border between China's Yunnan province and British Burma. The fighting took place in the mountainous area north of the point where the Burma Road crosses the border leading from Lashio in Burma to Lungling and Paoshan on the Chinese side. The Chinese forces were under the command of Gen. Chen Cheng, who defeated the Japanese on the Middle Yangtze in the spring. Japanese forces, which tried to dislodge the Chinese from the west bank of the Salween, numbered between 30,000 and 50,000. Fighting in this area took place amidst almost indescribable difficulties from the standpoint of terrain for the mountains are high and steep and separated by deep gorges. The fighting in October and November was along a 105-mile front in the vicinity of Lushui and Luku, northeast of Myitkyina, and according to reports from Chungking the Chinese were able to prevent the Japanese from crossing the Salween.

Attention was centered on the work of General Stilwell in the creation of a new Chinese army in northern India, the nucleus consisting of Chinese troops evacuated from Burma when British resistance collapsed in 1942. The British also contributed toward the project, and a large number of specially trained officers and noncommissioned officers of the U.S. Army were used to train the Chinese forces.

The Ledo Road. Aside from the training of personnel, the Americans and Chinese with the cooperation of the British authorities in India tackled one of the world's most difficult construction jobs, the building of a road from northern India to southwestern China to replace the Burma Road which the Japanese seized when they invaded northern Burma in 1942.

The starting point of the Ledo Road from the Indian end was Sadiya, Assam, the head of railway communication in northeastern India. The road was being driven through some of the world's densest forests and across successive ranges of

mountains from 2,000 to 6,000 feet in height. General Stilwell's Chinese troops had the job of guarding the road. By mid-November, they had advanced into the Chindwin Valley in northern Burma, about 100 miles beyond the Assam border and had contacted Japanese advance units.

Japan Makes Peace Overtures. Dr. T. V. Soong,

Japan Makes Peace Overtures. Dr. T. V. Soong, Chinese Foreign Minister, reported that the Japanese made several peace overtures to China in 1943. In August Japan offered to return to the status quo as of July 7, 1937, when the Japanese first opened fire at Marco Polo Bridge near Peiping, and to withdraw their troops from all parts of China except Manchuria, but demanded the retention of economic rights in North China. The Japanese also wanted China to "go in with them," otherwise join Japan in an "Asia for the Asiatics" policy. Dr. Soong declared that there was no conscious political group in China which would respond to Japan's feelers and that while China wanted to recover all Chinese territory, the Chinese "had no designs on a single foot of foreign soil."

Further evidence that there was another "behind-the-scenes" war, distinct from the clashes of the armed forces, going on in Asia between China and Japan was indicated in reports from other sources. Missionaries who had been stationed in territories nominally under the control of the Wang Ching-wei Government at Nanking reported that there was a definite tendency on the part of the puppet troops to "go over to the Chungking side." Americans repatriated from Shanghai stated that high officials of the Wang Ching-wei Government had begun to speculate on a place to go "in the event of Japan's defeat." It was stated there had been three attempts on Wang's life and that there was considerable talk in Japanese army circles about replacing him with someone in whom the Chinese had more confidence.

China at Low Economic Ebb. Economically and financially, China probably had reached its lowest ebb since the establishment of the Republic in

1911. The situation was a direct result of the prolonged war with consequent Japanese occupation of the chief industrialized and agriculturally de-

veloped sections of the country.

Dr. T. F. Tsiang, member of the Executive Yuan and Chinese representative on the United Nations Rehabilitation Administration, reported on November 17 that 84,000,000 Chinese were in need of relief, chiefly food. Dr. Tsiang stated that of China's estimated population, 200,000,000 lived under Japanese occupation, while 40,000,000 additional should be classed as "displaced." Of the residents of Japanese-occupied territory, 30 per cent or 60,000,000 were in need of relief, while 60 per cent of those displaced, or 24,000,000, needed help, the total being 84,000,000.

A report by the United Press from Chungking

A report by the United Press from Chungking in November said that a combination of floods on the Yellow River and Japanese aggression had complicated China's food problem, causing losses of human lives to be estimated in millions. In other sections the disruption of the country's economy resulting from Japanese aggression, particularly in Kwangtung, Chekiang, Shantung, and Anhwei, caused further distress affecting millions. The Japanese rounded up thousands of the refugees and shipped them to Manchuria to do slave

labor.

The Central Government at Chungking assisted several thousands of destitute by sending them in Government trucks to the frontier province of Sinkiang. The Government appropriated more than \$5,000,000 to purchase rice for the starving in

Honan alone. In addition large sums were remitted to China from the United China Relief organiza-

tions in the United States.

Great Currency Increase. The New York Times published a report on economic conditions in China from its correspondent in Chungking stating that the volume of currency had increased 12 times since the beginning of the war and that the increased volume of currency combined with the Government's mounting need for war materials and services and acute shortage of goods had resulted in inflation. In January the Government attempted to halt price increases by establishing price ceilings. Prices had been increasing at the rate of 10 per cent a month. The Government attempted to relieve distress among its employes by selling them rice, coal, salt, cloth, and vegetable oils at reduced prices and by providing monthly living allowances in cash and rice. The desperate shortage of mer-chandise caused by the Japanese blockade was relieved somewhat by a brisk smuggling trade which has sprung up between areas controlled by Chungking and Japanese-occupied territory.

Anti-Inflation Measures. Dr. H. H. Kung, Finance Minister and Governor of the Central Bank of China throughout the period of China's war with Japan, reported on November 1 that the following measures had been adopted to overcome the peril of inflation: 1. Expansion of revenues. 2. Intensification of retrenchment. 3. Promotion and stimulation of savings (compulsory as well as voluntary) by offering a variety of attractive securities some redeemable in either national or foreign currency. 4. Restrictions on the extension of credit by both Government and private financial institutions so as to clamp down on profiteering and at the same time to improve credit facilities for assisting the increased production of wartime necessities. 5. Coordination and improvement of the machinery of price control. 6. Regulation of the production and marketing of essentials such as foodstuffs, iron and steel, cement, oil and paper. 7. Carrying out of a national campaign to foster thrift and economy in consumption. 8. Acceleration of production both

in agriculture and industry.

Postwar Program. The National Resources Commission, of the Ministry of Economic Affairs, affiliated with the China Defense Commission, outlined a postwar development program designed to raise the general standard of living and strengthen national defense. The central objective was to prevent China from again becoming a victim of ag-

gression.

A comprehensive report, the first to be published in America, of the new industrialization program, with a map showing China's seven industrial areas as outlined by the National Resources Commission, appeared in *The Wall Street Journal*, New York,

on November 26 and 27

That China's N.R.C. (National Resources Commission) is a practical working agency was indicated in its 1942 report which showed the operation of 96 industrial "units," including 11 metalurgical, 4 machinery, 4 chemical equipment, 18 chemical, 6 tungsten, antimony, tin, and mercury; 31 coal, iron, copper, lead, and zinc; 18 electric power from coal, and 4 hydro-electric enterprises. The report stated that Chungking's five-year heavy industry plan covered: 1. An increase in output of coal, iron and steel. 2. Production of such machinery as locomotives, autos, machine tools, steamships, aircraft, farm tractors, and textile machinery. 3. Output of acids, soda, fertilizer, refined oil, rubber, and cement. 4. Factory output of electrical appliances coincident with construction of power-

producing facilities. 5. Export of such abundant minerals as tungsten, antimony, tin, and mercury, to secure foreign exchange to buy goods abroad.

Government Control. Considerable speculation was aroused in foreign financial and industrial circles by reports from Chungking indicating the intention of the Government to engage in the operation of most enterprises which fell into the classification of "heavy industries" and were closely connected with national defense. According to Dr. Wong Wen-hao, Minister of Economic Affairs, the Government intended to reserve to itself the operation of all defense industries including public utilities and fuel

fense industries, including public utilities and fuel. New Finance on China's Terms. Dr. T. V. Soong, Foreign Minister, in an interview in London on August 4 stated that foreign capital would be sought for the financing of China's first modern industries, but specified that foreign capital in future "must enter China on China's terms." Referring to Manchurian in particular, Dr. Soong stated that the Manchurian railways in future "would be controlled by China." It was thought that he had in mind reports that the Soviet Union might demand resumption of ownership of the Chinese Eastern Railway across North Manchuria which Russia sold to the Japanese after Japan's conquest of Manchuria in 1931. China strongly protested against the sale on the grounds that China possessed a half interest in the railway and that its sale to Japan was prejudicial to China's national interests.

Generalissimo Becomes President. The outstanding political development of the year in West China was the election of Generalissimo Chiang Kai-shek to the Presidency of the Republic. Chiang took the oath of office on October 10, the 32nd anniversary of the founding of the Republic. In an address broadcast throughout the country and abroad, he declared that China's policy was to achieve the early establishment of constitutional government. He pledged himself to endeavor to recover all of China's lost territories and to comply with the teachings of Dr. Sun Yat-sen, the father of the Chinese Revolution. General Chiang was elected to the office of President by the Central Executive Committee, the most powerful group in the Kuomintang Party. The term of office is three years. President Chiang Kai-shek retained his position as commander-in-chief of China's land, naval, and air forces and in addition maintained control of the Party organization through his presidency of the Central Executive Committee. The office of President had been largely decorative but under General Chiang it was expected to become a powerful post in the United Nations group.

Shortly before his election Chiang was awarded the new American Order of the Legion of Merit in the degree of Chief Commander. He was the first Chinese to receive this honor, which only one officer in the U.S. Army, Gen. George C. Marshall, Chief of Staff, held in similar rank. Chiang's election as President followed the death on August 1 of President Lin Sen, 79 years of age, who had held the office of chief executive since 1932. In his final testament President Lin Sen called upon all Chinese to follow the leadership of Generalis-

simo Chiang Kai-shek.

Constitutional Period. The Central Executive Committee at the same meeting voted to call a National People's Congress within one year after the end of the war for the purpose of adopting a permanent constitution.

According to Chiang's address at the opening of the plenary session of the Central Executive Committee on September 6, the establishment of constitutional government would mark the handing over of the government to the people, following which the Kuomintang "should take its place on equal footing with other ordinary parties and common citizens enjoying equal privileges and rights, fulfilling equal obligations and receiving equal treatment from the state under the principles of freedom of assembly, organization, speech, and publication under the law."

China, from a constitutional standpoint, was officially in the "Period of Political Tutelage," which followed the "Period of Military Consolidation" when the Kuomintang or Nationalist Party established itself as the government of the country. The period of tutelage was to prepare the people for the final stage of constitutional government. The Kuomintang issued a call for a National Assembly to adopt a constitution in 1937 but the outbreak of war with Japan prevented the convening of the assembly. In 1938 the Kuomintang organized the People's Political Council which served as an advisory, supervisory, semi-legislative popular assembly in which minority groups were, in theory at least, represented, including the Communists, State Socialists, and the National Youths.

The Executive Yuan enacted legislation providing for the establishment of popular assemblies in all districts where the new hsien, or county system, was scheduled for enforcement in 1944. The bill provided that all magistrates and officers should convene meetings of villages, districts, and counties so that organs of public opinion might be established within the prescribed period. It was also specified that municipal authorities must assume responsibility for reorganization of local police, construction of roads, enforcement of mass education and improvement of public health.

The Chinese Communists. Prior to his election as President, Generalissimo Chiang, as President of the Kuomintang Party, instructed the Central Executive Committee "to maintain a policy of leniency and forbearance toward the Chinese Communists." He said that the problem of the Chinese Communists was a "purely political one and must be solved by political means." Chiang's statement attracted wide attention due to reports of clashes between Government troops and armed Communist bands in Shantung and elsewhere in North

and Northwest China.

Spokesmen for the Chinese Communists alleged that the Central Government had maintained a strong cordon of troops about the Communist-controlled district of Northern Shensi province, which, according to their allegations, "might have better been used in repelling Japanese aggression." Spokesmen of the Government, however, charged lack of cooperation on the part of the Chinese Reds, who had maintained an independent existence within a closely guarded area of Northern Shensi, Shansi, and Suiyuan, and had refused to permit their well-trained and equipped Fourth and Eighth Armies to be incorporated into the national forces. The National Government stated its troops were stationed in southern Shensi to prevent the Japanese from crossing the Yellow River and invading Kansu and Sinkiang provinces. Since the beginning of the war against Japan the Chinese Communists had concentrated largely on guerrilla activities in the northern provinces, leaving the matter of positional warfare against the Japanese in Central China and on the Burma front to the Central Government.

Government spokesmen professed anxiety that the Chinese Communists, being under Russian influence, might set up a separate independent gov-

ernment in the northwestern territories and ask for Russian military protection somewhat as occurred in Outer Mongolia where a Russian-instigated "Mongolian People's Government" in June, 1921, made a treaty with the Soviet Union providing for Soviet military assistance. Mongolia has in the meantine become to all intents and purposes

a part of the Soviet Union.

That Russian interest in the Chinese Communists continued, despite the dissolution of the Third International, was indicated by a statement by Vladinir Rogoff, Far Eastern representative of the official Soviet Tass News Agency charging that "capitulators and defeatists" in the Kuomintang were involved in a "vicious intrigue to crack the Kuomintang's united front with the Communists." Rogoff declared that the Red Fourth and Eighth Armies "comprise the most advanced, firmest and most self-sacrificing people of China." He charged that the Kuomintang had sent large forces to the Mongolian frontier where the Red armies were operating for the purpose of disarming them and "wiping out the Communist Party." Concluding, the Soviet spokesman alleged that "civil war may be near . . . if fratricidal war results it will lead to fatal consequences for the Chinese war of liberation . . . it will be tantamount to aiding the Jap imperialists." Rogoff also asserted that highly placed individuals at Chungking were "engaging in speculation and self-enrichment . . . rather than investing capital in war industry."

Chungking made no direct reply to the Soviet allegation but a member of the Central Executive Committee published an article demanding that the Russians "open a second front in Asia by declaring war on Japan." The writer, Chow Lu, declared that China "was looking forward to Russia's taking a more resolute stand than the dissolution of the Comintern . . . China wants a Russian declaration of war against Japan which would make the grand united front of the Allies complete."

Russia Evacuates Sinkiang. There was a significant development in China's far western province of Sinkiang late in 1942 and early in 1943 which aroused international attention. It was the sudden withdrawal, without explanation, of a considerable Russian force which had been in practical occupation of China's most western province for nearly a decade. Soviet diplomatic quarters in Chungking stated, unofficially, that the Soviet forces had been stationed in Sinkiang "for the purpose of prevent-ing an invasion of that territory by the Japanese." The Russians alleged that Japanese intrigue had been strong in the territory at the time of Japan's occupation of Manchuria and northern China in 1931–32, hence it had been necessary for the Soviet Union to take "independent self-protective action" by stationing a strong force in China's most western territory beginning in 1924. The rewestern territory beginning in 1934. The Russians also engaged in extensive trading and industrial activities including the drilling of oil wells in a potentially rich field in the Kashgar district. The Russians brought with them doctors, engineers, advisors, blooded horses, movies, music, books, a police system, and advanced a loan of 5,000,000 rubles to the Sinkiang provincial government. (See Life Magazine, Dec. 6 and 13, 1943.) Russian penetration and domination of the area was so com-plete that travelers had to obtain Soviet permits to visit the territory and such permits were only granted in exceptional cases. On a few occasions when Americans and other neutrals visited Sinkiang they were given reports from Chinese sources telling of strong Soviet intrigue tending in the direction of ultimate annexation.

The action of the Cairo Conference in promising to restore Manchuria and Formosa to China and to reestablish the independence of Korea was expected to lead ultimately to a settlement of outstanding issues between China and Russia.

Improved International Status. China's spiritual distress resulting from seven years of warfare and the occupation by the enemy of her most productive territory and leading cities was alleviated somewhat by the action of her allies in taking steps to restore her administrative and territorial status

as an independent nation.

These steps involved two important developments: first, the relinquishment of extraterritorial rights in China by the United States and Great Britain on May 20, and second, the adoption by the U.S. Congress of a bill repealing the 60-year old Chinese exclusion laws. The bill was signed by President Roosevelt on December 17 following his return from the Cairo and Tehran conferences. The latter action made Chinese living in the United States eligible for citizenship through the process of naturalization and in addition removed immigration barriers to permit 105 Chinese to enter the United States annually on a quota basis, similar to citizens of other countries.

The President declared when he signed the bill that it represented a manifestation on the part of the American people of their affection and regard, heightened obviously by China's long-sustained resistance to Japanese aggression. The President expressed the hope that the removal of the unfortunate barrier between the Allies would result in the war effort in the Far East "being carried on with greater vigor and a larger understanding of

our common cause."

From a practical standpoint the Congressional action helped to silence distorted Japanese propaganda among oriental peoples to the effect that the causes for which the United Nations fought were not applicable in the every-day relations of East and West. See Thailand under *History*.

Early in October China agreed to hand over jurisdiction in criminal offenses committed by members of American armed forces in China to the "service court and the military and naval authorities of the United States." The action was taken by China as a war measure due to the presence within the country of an increasing num-

ber of American armed forces.

Among the outstanding developments in the relations of China and the United States in 1943 was the American visit of Madame Chiang Kaishek, wife of China's Generalissimo and a member of the Soong family which had played an important part in the politics and government of China since the revolution in 1911. Madame Chiang spent several months in the United States and delivered a number of notable addresses which contributed greatly to a better understanding on the part of Americans with regard to China's problems incidental to the war. Madame Chiang was given one of the most enthusiastic welcomes ever accorded a foreign visitor by the 'American people. Among her many addresses delivered before audiences in various parts of the country, the most notable were before members of Congress at the Capitol in Washington and at Madison Square Garden in New York, the latter being attended by more than 20,000 people.

CHRIST, Churches of Or Disciples of (Christian Churches). See DISCIPLES OF CHRIST.

CHRISTIAN SCIENCE. A system of metaphysical or spiritual healing, discovered by Mrs. Mary Baker Eddy in 1866 and set forth in her textbook of the Movement, Science and Health with Key to the Scriptures, first published in 1875. The first church was established by Mrs. Eddy in Boston in 1879. In 1892 it was reorganized as a voluntary religious association, known as The First Church of Christ, Scientist, in Boston, but called more frequently by its adherents, "The Mother Church." The total number of recognized branches of The Mother Church in the United States reported for the fiscal year ending May 31, 1943, was 2,190, and there are also 70 college and university organizations. Total branches for the world. 2.879.

Total branches for the world, 2,879.

The affairs of The Mother Church are administered by a board of directors which supervises the work of the board of education, board of lectureship, and Committee on Publication. The board of education instructs and authorizes students to teach Christian Science. The board of lectureship consists of 25 members who are engaged in delivering free lectures on Christian Science.

livering free lectures on Christian Science.

The Christian Science Publishing Society, whose affairs are administered by a board of trustees according to the Manual of the Church, issues the daily paper of the organization, The Christian Science Monitor. Other periodicals include The Christian Science Journal, Christian Science Sentinel, Christian Science Quarterly, and four editions of The Herald of Christian Science, in the German, French, Dutch, and Scandinavian languages, each with the English translation opposite, and in Braille.

Mrs. Daisette D. S. McKenzie is president of The Mother Church for the year 1943-44. Headquarters are at 107 Falmouth Street, Boston, Mass.

CHRISTMAS ISLAND. The name of two separate islands. (1) An island in the Indian Ocean (10° 30′ S. and 105° 40′ E.), a dependency of the Straits Settlements. Area, 60 square miles. Population (Jan. 1, 1941, estimate), 1,431. In 1940 the main imports were iron, steel manufactures, building materials, oil, and foodstuffs; exports consisted of phosphate of lime (238,006 tons). On Apr. 10, 1942, Japanese armed forces occupied the island. (2) The largest atoll in the Pacific (2° N. and 157° W.), over 100 miles in circumference, included in the Gilbert and Ellice Islands Colony (q.v.). It is leased to the Central Pacific Coconut Plantations, Ltd.; for a period of 87 years from Jan. I, 1914. Population (1937), 47.

#### CHROME, CHROMITE. See CHROMIUM.

CHROMIUM. Ability of the Allies to keep open the sea lanes, coupled with restrictions upon use and substitutions in the steel industry, banished any threat of a possible chromium shortage in 1943. At the outset of the war, loss of the Philippines, which had contributed as much as one-quarter of United States consumption, coupled with cutting of the sea lanes to India, New Caledonia, and

Turkey, and dangers to shipping from Africa threatened to throw this country back on virtually undeveloped, low-grade domestic ore resources. Convenience of Atlantic ore deposits to lend-lease trade routes, upon which returning vessels were in need of ballast, availability of Cuban ore, and finally opening of the Mediterranean sea lanes to Turkey, all were factors favoring maintenance of imports on a high level. Early in 1943, the government ordered curtailment of development of one low-grade Montana deposit, and, on October 27, announced that operations in low-grade Montana chrome mines were to be put in stand-by condition and labor diverted to mines producing more critically needed minerals. Concurrently, it was announced that no new government purchase contracts would be entered into for the import of chemical chromite.

Domestic production consisted of mines in Glenn and San Luis Obispo Counties, California, two new and unique plants on the Oregon coast, and more or less seasonal and irregular production from several score northern California and Oregon "kidney" deposits. The War Production Board throughout the year frowned on construction of beneficiation plants to concentrate low-grade domestic ores, thus ruling out what had appeared to be an essential stopgap earlier in the war. The Metals Reserve Co., Federal ore-buying agency, has committed itself to a purchase of small lots of chrome ores from domestic mines through 1944. On May 15, Metals Reserve smoothed out its purchase price schedule in effect at 21 depots in ten western States. It was at these depots that most of the smaller mines sold their ore.

In the form of ferro-chrome, chromium is added as an alloying element to produce corrosion and heat-resistant steels. This use most frequently comes to the public eye in the form of so-called "stainless" steel. In September, 1941, there was devised a series of alloy steels, known as the National Emergency Steels, whose use of alloying elements was considerably less than normal. In 1943, 4,250,000 tons, or about one-third of the United States production of alloy steels, consisted of low alloy NE steels saving vast quantities of such important alloying elements as chrome. At the same time, alloy steel scrap was being generated faster than it was consumed until at the end of the year this excess amounted to 100,000 tons of scrap per month. About one-quarter of the chrome being melted at the end of 1943 came from scrap, thus an abundant supply from this source was assured.

Domestic ore production for chrome in the prewar period was 1,506 tons annually. In 1943 it was 100,000 tons. Consumption prewar was 362,873 tons annually, and in 1943, 900,000 tons. Stocks at the end of 1943 were 1,100,000 tons. The easier chrome supply is reflected in the War Production Board's removal of high carbon chrome from allocation and easing of restrictions on use of chrome alloys. See Geological Survey; Turkey.

CITIZENS DEFENSE CORPS, SERVICE CORPS. See CIVILIAN DEFENSE, OFFICE OF.

#### CITRUS PRODUCTS. See HORTICULTURE.

CIVIL AERONAUTICS ADMINISTRATION (CAA). A branch of the U.S. Department of Commerce which encourages and fosters the development of civil aeronautics and air commerce; encourages the establishment of civil airways, landing areas, and other air navigation aids and facilities; designates and establishes Federal airways; acquires, establishes, operates, and maintains air navigation facilities along civil airways and at landing areas; makes provision for the control and protection of air traffic moving in air commerce; undertakes or supervises technical developmental work in the field of aeronautics; plans for the development of aeronautical facilities; and administers the affairs of the Washington National Airport.

The Administrator also carries out civil aeronautics safety regulation (excepting the prescribing of safety standards, rules and regulations, and the suspension and revocation of certificates after hear-

ing).

The CAA War Training Service is now chiefly engaged in providing elementary flight instruction for Army and Navy aviation cadets in conjunction with the college programs of the armed services, and in training a group of Air Corps Enlisted Reservists on inactive status for employment as noncombat service pilots. It is also conducting several flight schools for the training of instructors for the Navy. Pilot training is not now being provided for civilians as such (see 1943 Year Book for the former Civilian Pilot Training Program).

Vital contributions to national defense are also made by the Federal Airways System and by the technical development work of the CAA. The Federal Airways System now comprises a network of more than 40,000 miles of "highways of the Air." It is being expanded and improved throughout Alaska. Installations in Hawaii and the Pacific Islands, as well as in the Caribbean area, are now proving their military value.

Development work is proceeding in the fields of ultrahigh frequency communication and directional guidance facilities; monitoring equipment; flutter and vibration of aircraft components; engine nacelle fires; airport design; soil testing and stabilization; airport lighting; obstruction marking by radio; traffic control; instrument landing systems; and aeronautical charts. See Aeronautics. Administrator in 1943: Charles I. Stanton.

CIVIL AERONAUTICS AUTHORITY. A division of the U.S. Department of Commerce. Its functions are discharged by the Civil Aeronautics Administration and the Civil Aeronautics Board (qq.v.).

CIVIL AERONAUTICS BOARD (CAB). A five-man nonpartisan board organized independently within the U.S. Department of Commerce. It prescribes safety standards and regulations and has the power to suspend and revoke safety certificates, regulates air carriers, makes accident rulings and recommendations, and investigates accidents. Chairman in 1943: L. Welch Pogue. See Aeronautics under Postwar Air Policy.

CIVIL AIR PATROL (CAP). See CiVILIAN DEFENSE, OFFICE OF.

CIVIL DISOBEDIENCE. See India under History.

CIVILIAN DEFENSE, U.S. Office of (OCD). The U.S. Office of Civilian Defense was established May 20, 1941, for the purpose of assuring effective coordination of Federal relations with State and

local governments engaged in the furtherance of the War Program; to provide for necessary cooperation with State and local governments with respect to measures for adequate protection of the civilian population in emergency periods and to facilitate constructive participation in the war effort

To carry out its purpose, the Office has two principal divisions: Protection and Civilian War Services. The Protection Branch has the responsibility of safeguarding the nation against the effects of enemy attack, trains and organizes volunteers in blackouts, camouflage and protective construction, defense from bombs and gas, decontamination of gassed areas, rescue of endangered persons and civilian casualties, evacuation, demolition of damaged structures and clearance of necessary thoroughfares, repair of disrupted utilities, auxiliary fire and police services, and many other "passive" defense measures. These programs are carried on through the U.S. Citizens Defense Corps.

on through the U.S. Citizens Defense Corps.

The Civilian War Services Branch assists State and local governments in organizing Defense Councils to serve as the focal point for coordination of community resources in meeting local problems arising from the war. Activities include the fields of health, nutrition, housing, consumer interests, recreation, salvage, transportation, agricultural labor, war savings, services to service men, and other programs prepared in cooperation with other Federal agencies responsible for such activities. Through the volunteer offices of the Defense Councils, citizens are provided with means to participate actively in the war programs of their local community, and are enrolled as members of the Citizens Service Corps.

During 1943, community Civilian Protection units proved useful in a number of natural disasters such as floods, fires, tornadoes, train wrecks, mine explosions, war plant and aviation accidents—while Civilian War Services volunteers participated in bond drives, salvage campaigns, and

other war programs.

In the Protection Branch, in addition to the Office of the Chief, there are the Protection, Medical, and Facility Security Divisions. In the Civilian War Services Branch the divisions are those of the Chief, National Programs, and Defense Council Organization. These divisions are organized into technical and service sections appropriate to the scope of the Branch. The National Office itself is headed by a director, assisted by an administrative staff. Nine regional offices are maintained with regional liaison officers in constant contact with State and local Defense Councils, thereby lending assistance in the development and execution of national programs.

There are 11,486 Defense Councils in the United States. Under these Councils functions the Citizens Defense Corps, consisting of Air Raid Wardens, Fire Guards, Auxiliary Firemen, Auxiliary Police, Emergency Medical Services, Rescue Units, Emergency Welfare Services, Messengers, Control Center Personnel, Demolition and Clearance, Road Repair, Utility Repair, and other units. Under them also functions the Citizens Service Corps, which consists of volunteers active in the war services

field.

Civilian War Services. Many valuable contributions were made by Civilian War Services volunteers during 1948. In connection with the Third War Loan Drive in September, Defense Council volunteer forces cooperated with the U.S. Treasury Department in selling war bonds and stamps. The Chicago, Ill., Defense Council, through Block

Leaders and others, made approximately 250,000 bond sales for a total of more than \$35,000,000. The services of 4,683 block workers were utilized in a house-to-house canvass in Portland, Ore, which produced several millions of dollars in war bond sales. In Oklahoma City, Okla., 2,500 women sold \$375,000 in bonds as part of their neighborhood service work. During 1943 many communities also put their block organizations to work with excellent results on programs involving carsharing, housing, and vacant room surveys, explanation of point rationing, survey of day-care needs for children of working mothers, securing donations to the blood plasma bank, victory garden campaign, scrap collection, tin can processing and collection, manpower and womanpower surveys for war industries, and the promotion of part-time or full-time aid to farmers.

In Fayetteville, N.C., block workers campaigned

In Fayetteville, N.C., block workers campaigned to encourage inoculation against typhoid fever, diphtheria, and smallpox. In Fort Smith, Ark., when the May floods broke the city's water supply mains, block leaders took the job of designating where free water would be dispensed and helped staff the dispensing stations. LaJunta, Colo., used its block workers to check a diphtheria epidemic, while in Philadelphia block wardens helped in the campaign to enlist qualified young women in the

Women's Army Corps.

Cooperating with the U.S. Department of Agriculture, Defense Council committees engaged in an over-all campaign to promote the production, sharing, and proper use of food. Throughout the nation, these councils helped mobilize townspeople for work on farms and in food processing plants and in the development of 20 million Victory Gardens. In addition, consumer committees cooperated in the OPA's market basket and home front pledge campaigns to combat black markets, and sponsored clothing clinics, swap shops, and courses in the care and repair of household equipment as part of the general war conservation program. Consumer committees worked closely with war price and rationing boards in enlisting community understanding and action in price control and rationing programs.

Over 1,000 Child Care committees were organized by Defense Councils during 1943 to study the needs and promote community-wide programs for children of working mothers. In 500 communities, Federal funds amounting to over \$12,000,000 had been provided under the Lanham Act to enable war-impact areas to open nurseries and preschool centers, and OCD volunteers helped conduct surveys so that the best possible use of these

grants could be made.

War Service volunteers in several States made complete rosters of all available nursing personnel and established these rosters on a county basis with a registered nurse in charge of the records. Nurses were called out for special services in fires, train wrecks, floods, etc. Defense Council Health committees took part in a campaign to recruit men volunteers for work in hospitals to relieve the acute shortage of orderlies and maintenance men. This campaign was sponsored in cooperation with the American Hospital Association.

Salvage committees, established by the War Production Board and incorporated into the Defense Council structure in most communities, conducted salvage of scrap metals, fats and greases, silk and nose, and other needed materials. Transportation committees worked with OPA, ODT, and other agencies in sponsoring car-sharing so as to conserve private automobiles, tires, and gasoline.

To recognize officially the war services of boys and girls under 16 and to provide Defense Councils with a mechanism for planning war service projects for organized and unaffiliated youth, the OCD during 1943 established the Junior Citizens Service Corps. In line with this youth program, States have set up committees whose personnel represents youth interests on a State-wide basis. Typical war services being performed by junior groups include the collection of scrap materials; assistance at child care centers, war price and rationing boards; help at recreation centers and hospitals; participation in national war bond and stamp drives, and the raising and conservation of food.

Civilian Protection. In order to bring to local communities the best advice obtainable on technical subjects, the Protection Branch of OCD formed a Technical Board combining the diverse talents of scientific leaders in the fields of engineering, medicine, and technology. It also organized the Industrial Protection Council to operate in the field of industrial plant protection. Leading national figures representing management, labor, and the government have made their specialized knowledge available through the Industrial Protection Council, and during the year important new methods of protection for all industrial plants, especially those carrying particular war responsibilities, were introduced. The National Security Award was established, in line with the plant protection program, to recognize those industrial plants which had developed superior safeguards against the hazards of fire, accident, and sabotage, as well as air raid attack. The first of these Awards was made early in November.

Another 1943 development was the organization of the Fire Guard unit of the Air Raid Warden's Service, which absorbed the former Fire Watcher's Service, broadening the responsibilities of OCD volunteers with respect to the control of small fires of every nature. Although the Fire Guard unit is not yet fully recruited, trained, or equipped, it has already demonstrated its usefulness in preventing fires under wartime conditions, thereby helping to reduce the national fire loss. The OCD equipment allocations program involved fire-fighting equipment in a volume greater than that produced in the last 25 years. It also included medical supplies for 5,400 medical field team units and for 1,500 casualty stations. Gas masks produced are held in reserve in strategic locations for rapid

shipment in case they are needed.

Commissions and individual representatives of OCD visited Great Britain to obtain the best factual information for civilian protection in America. Reports received at frequent intervals from an attaché in the United States Embassy in London were made available to operating officers in both the Washington and Regional offices. As of Oct. 20, 1943, 433 general reports and 116 medi-

cal reports had been received.

The basic system of air raid signals was modified by Army regulations in February and concurred in by OCD in order to provide intermediate audible public warnings between the confidential "Yellow" and the "Red." A number of tests and exercises familiarized the public with these regulations and with the new signals. Exception was made for West Coast communities which retained signals specified by the Commanding General of the Western Defense Command. Extensive work was done to improve methods of blackout and dimout in coastal areas and important war centers. Dimout regulations were placed in force on the

coasts to reduce sky glow and combat submarine sinkings. Dimout regulations were suspended by the Army and Navy in October, with a possibility of their return should the situation warrant it.

Following extensive engineering tests, a program for clearly marking and designating portions of existing buildings as air raid shelters was carried out. OCD worked with manufacturers to develop and make available sound machines capable of carrying air raid warnings great distances, which would not require the use of critical materials. Satisfactory military progress, leading to a decrease in air raid hazards in the interior areas resulted in a review of the problems of civilian protection, and some decrease in the protective forces in these areas was suggested in accordance with the lessened danger. Revised standards of protection training were established by regulation. The system of schools and courses to train members of the Defense Corps was revised in mid-year. The War Department-OCD Civilian Protection schools were discontinued June 30.

During the year, the Facility Security Division and its Sections, which had been primarily concerned with sabotage, were expanded to include plant protection. The voluntary inspection program provides for some measure of security for plants the protection of which is not the responsibility of the Army, Navy, or Federal Power Com-

mission.

On April 29 the Civil Air Patrol, created a week before Pearl Harbor on the initiative of America's private flyers, was placed under the jurisdiction of the War Department. The CAP, which had been directed and trained by the Office of Civilian Defense, performed valuable services such as the reporting of planes crashed on sea or land, dropping supplies to survivors, sending ground crews on rescue missions, forest fire patrol, trans-

portation of blood plasma, etc.

The War Emergency Radio Service, a system of two-way communication was widely used in disasters such as floods and fires. Specific authorization of the Federal Communications Commission was given to this service. Also activated in numerous emergencies was the Emergency Welfare Service which brings together under one head five major functional services: (1) information and service centers; (2) food and housing centers; (3) central registry; (4) clothing centers, and (5) rehousing and rehabilitation. In war disasters, these services have operated jointly with State authorities and the American Red Cross. The well-organized and well-trained forces of

the Emergency Medical Services were called into action during emergencies to administer strategi-cally based stocks of blood plasma, to function as mobile medical teams administering life-saving procedures at the scene of the incident, and in hospitalizing and caring for serious casualties. The Medical Division, in cooperation with the U.S. Public Health Service, has 158,290 units of liquid, dried, and frozen plasma in all important communities throughout the United States for civilian use in emergencies. Grants were made to 168 hospitals to enable them to establish blood and plasma banks. In twenty coastal States, 321 institutions in relatively safe inland areas have been designated as Emergency Base Hospitals, and groups of physicians in more than 100 medical schools and hospitals have responded to the invitation of OCD and the Surgeon General of the U.S. Public Health Service to form hospital units of 15 doctors each. Nurse deputies of State and local Chiefs of the EMS are recruiting nurses for

service to civilians at Emergency Base Hospitals

and for the temporary care of military casualties.

The organization of gas defense elements in critical zones proceeded during the year, courses being given in schools operated jointly by OCD and the War Department. A total of 61 State gas specialist courses were conducted. On the basis of British experience, the Rescue Service was reconstituted and greatly enlarged and two pilot schools held to train instructors, one at the U.S. Bureau of Mines Experiment Station at Pittsburgh, Pa., and the other at the University of California College of Mining, Berkeley, Calif. A demonstration of the nature and effects of enemy air raids, "Acof the nature and effects of enemy air raids, "Action Overhead," staffed by members of the Chemical Warfare Service, U.S. Army, was conducted in 124 cities before a total of 2,260,000 persons.

Thus, during 1943, a great home front army of volunteers, trained in the techniques of civilian defense, not only protected the nation against possible enemy attack, but in the War Services protected America's well-being in numerous other ways. Towards the close of the year, civilian defense, keeping pace with the changing trends of the global war, went increasingly on the offensive. On Sept. 10, 1943, James M. Landis resigned as U.S. Director of the Office of Civilian Defense to become American Director of Economic Operations in the Middle East. Since that date John B. Martin has been Acting Director.

CIVIL SERVICE COMMISSION, U.S. The recruitment of employees for the war agencies of the Federal Government, and the testing of their qualifica-tions, are responsibilities of the U.S. Civil Service Commission. In the face of a growing labor shortage, it was necessary for the Commission during 1943 to develop every available source of manpower in order that Government employment might achieve its optimum wartime strength.

The Commission encouraged Government agencies to employ the physically handicapped, and during the 12 months ended Sept. 30, 1943, more than 17,000 physically handicapped persons were placed in all types of jobs in Federal establishments. Records show that they are making good.

Special attention was given to the placement of the returning war veteran. All possible steps were taken to keep wounded and other discharged veterans informed of their opportunities for Federal employment. Veterans who had left other than temporary Federal jobs to enter the armed forces were reinstated, in accordance with the law, in their old jobs or in similar ones, if they applied for reinstatement within 40 days of their honorable discharge and were still qualified to do the work. The Commission established a unit within its organization to work full-time on veteran problems.

The increased employment of women provided another answer to the Commission's recruiting problem. At the end of the fiscal year 1943, an army\_of nearly 1,000,000 women was at work for the Federal Government. Besides filling the tra-ditional "women's" jobs, in clerical and profes-sional fields, women, by the thousands, were at work on production lines in Government-operated

armament plants, such as navy yards and arsenals. By July, 1943, total employment in the Federal executive civil service had reached 3,156,953: the Government's personnel had trebled in the three years since the inauguration of the nationaldefense program. Only 9 per cent of these employees were located in the departments and agencies in Washington, D.C. The great majority were located in field establishments of the Covernment throughout the country, and 154,500 were on duty outside the continental United States.

In the days of mass staffing of war agencies, the effort to get employees on the job quickly led, in a considerable number of instances, to a lowering of examination requirements. In 1943, however, with Federal employment at the 3,000,000 mark, the Civil Service Commission was able to bend its efforts from the task of high-speed recruitment and placement of emergency workers and to give increasingly greater attention to the strengthening of examination standards. Speed, the Commission felt, must continue to be a factor, but there was a point, the Commission declared, below which requirements must not be set if the appointment of inadequately qualified persons, and a consequent slowing down of the war program, was to be avoided. On a par with the Commission's move to tighten examination require-ments was the program, launched in 1942 and broadened in 1943, to bring about maximum utilization of present manpower resources in carrying on the war activities of the Government.

At the outset of the war, thousands of Federal

employees were found to be working below their highest skills, and other thousands were found to be using their highest skills for only a part of the work day. To combat this waste, the Commission, under authority of Executive orders and a War Manpower Commission directive, in 1942, established a vigorous war-transfer program. When the Commission determined that transfer would result in a more effective contribution to the war program, employees found to be working below their top skills were assigned to other agencies or, in some cases, to public or private enterprise. In 1943, in line with the Commission's expanding policy of maximum utilization of personnel, the program was carried straight to the employee: Federal workers were urged to make it known if their highest skills were not being fully used in the war effort. In the 21 months following the start of the program in 1942, over 100,000 war transfers were effected.

Additional transfer activity and personnel utilization resulted from the passage of legislation providing for the payment of overtime compensation to civilian employees of the Federal Government (Public Law 821, approved Dec. 22, 1942, and Public Law 49, which replaced it on May 7, 1943). Agencies which the Director of the Bureau of the Budget found to have excessive personnel were required, under these laws, to reduce their personnel or to forego overtime pay, and the Civil Service Commission was responsible for effecting the transfer of any employees released under these laws whose services were needed in other agencies. Approximately 4,000 such inter-agency transfers

had been effected by the end of September, 1943. The Commission urged Government agencies to conduct surveys which would disclose under-utilization of employees' skills. Agencies were asked to analyze employees' needs for training,

and to provide adequate training facilities. Reports of 11 such surveys showed that they covered 39,-246 positions and resulted in elimination of 2,782 positions and reassignment of 623 employees to positions in which their skills were better utilized.

In order to improve supervision, the Commission sponsored Government-wide adaptation of the plan developed for industry by the Training Within Industry branch of the War Manpower Commission (q.v.). As a result of this program, more than 100,000 supervisors in the Federal service had been given training by the end of November, 1943. See LAW under Legal Education.

COAL AND COKE. Beset by labor shortages and work stoppages, the United States coal industry was hard put to keep up with demand during 1943. Harold Ickes, Solid Fuels Administrator for War, declared that consumption and exports of bituminous coal exceeded production by 21,000,000 tons. Stocks in the hands of consumers and dealers by Jan. 1, 1944, amounted to 60,078,000 tons, according to Mr. Ickes, less than at any time since March, 1942.

The anthracite situation was not much better although production was close on the heels of 1942 when 60,328,000 net tons of Pennsylvania anthracite was produced. In 1943, estimated production was 60,327,000 tons.

Estimates of production of bituminous coal and lignite for 1943 approximated 589 million net tons compared to 580 million net tons mined in 1942 and 579,385,820 in 1918.

The principal reason for shortage, however, was demand rather than supply. Industrial plants and railroads ran at capacity throughout the year. Heavy railroad traffic to the Pacific Northwest resulted in severe coal shortages in that area which had to be filled by diversion from Canada, and Canada's needs in turn, had to be partially satisfied by diversion from midwestern coal regions of the United States.

Record metallurgical activity, principally in the iron and steel industry, brought forth production of 71,950,000 net tons of by-product and beehive coke in 1943, almost 1,500,000 tons more than the previous year. The greater proportion of this output and increase was in the by-product coke category, where production increased 2.5 per cent over 1942 to 63,850,000 tons. Beehive production, most of which came from obsolete ovens rehabilitated after years of idleness, was estimated at 8,100,000 tons, about the same as 1942. The U.S. Bureau of Mines estimated the value of by-product coke production to be \$390,000,000 and of beehive, \$48,000,000, together about three per cent greater than 1942. The increase partially reflected higher prices authorized by OPA. Value of chemical by-products

was estimated to be \$195,000,000.

The postwar future of beehive ovens appears to be even darker than their immediate prewar past because of the construction of substantial byproduct coking capacity as an integral part of the

steel expansion program.

Four major labor stoppages occurred in the coal industry during 1943. The first commenced May 1 and continued until May 4, after expiration of a 30-day extension of the bituminous miners' agreement with operators and the expiration of the regular anthracite agreement. At issue were demands by the United Mine Workers union for a pay increase of \$2.00 a day, portal-to-portal pay, and related benefits. Solid Fuels Administrator Ickes took over all producing mines in the name of the government on May 1, as directed by President Roosevelt. John L. Lewis, president of the United Mine Workers, proclaimed a 15-day strike mora-torium and ordered all miners back to the pits on the terms of the old agreement pending negotia-tions with the government to end the walk-out. On May 16, this truce was extended until May 31. The second strike occurred the first five days in June, the issues remaining unsettled. Again, a 15-day truce was declared. At the end of this truce a third walk-out occurred, the government again taking over the mines. Then a further truce was declared until October 31, and the mines once again were returned to their owners. On November 1 a fourth strike was called, this time lasting three days. This time, again after government seizure, Solid Fuels Administrator Ickes signed a contract with Mr. Lewis by which the miners extended their working time and received a wage increase of \$1.50 a day. Previously the miners had been granted an increase of \$1.50 a week for blacksmithing, safety equipment, and other incidentals. The mines were being returned to private management one by one at the end of the year.
Mr. Ickes also made news with the prediction

Mr. Ickes also made news with the prediction that the time was approaching when petroleum must be supplemented as an industrial and domestic fuel and as a source of gasoline and that there was immediate need to develop on a commercial basis methods of making liquid fuel from coal, lignite, or oil shale. He stated that he hoped soon to "lend an official hand" in this development.

MINISTRATION; WAR PRODUCTION BOARD.

CHARLES T. POST.

COAST AND GEODETIC SURVEY. A branch of the U.S. Department of Commerce. In addition to surveying and charting the coasts, it compiles tide and current tables, aeronautical charts, magnetic information, seismological and gravitational and astronomical observations. All operations of the Survey are now being carried on to meet war needs. Director in 1943: Leo Otis Colbert.

COAST GUARD, U.S. The wartime expansion of the Coast Guard outlined in detail in the 1943 Year Book has continued during the past year. From a total of 1,516 officers and 17,546 men in the service in 1941, manpower was increased in 1943 to

well over 170,000 men.

To add further to the strength of Coast Guard personnel, the Women's Reserve of the U.S. Coast Guard Reserve, popularly called the SPARS, has recruited 6,000 officers and enlisted personnel. They will be used to replace in shore establishments those men who are able for duty at sea or abroad. The recruiting program for more women will continue for some time. The enlisted women are now trained at Palm Beach, Fla., and the officers at Coast Guard Academy, New London, Conn.

During 1943 Coast Guard floating equipment also reached an all-time peak. In addition to nearly doubling the number of its own craft of all kinds, the Coast Guard has been manning a total of 215 vessels of the U.S. Navy, including troop transports, LST's (tank landing ships), LCI's (infantry landing craft), cargo vessels, 173-foot PC boats, and 110-foot subchasers. Since the report in the last Year Book, the Coast Guard has lost three of its ships: the 165-foot cutter Escanaba, the 117-foot Natsek, and the patrol ship Wilcox. Personnel losses have been sustained not only in connection with sinkings but also during landing operations on enemy beaches.

Throughout 1943, the Coast Guard, in harmony with the changes that have taken place in the war, has shifted the emphasis on its several functions to some degree. Internal change within the organization itself has also resulted in a shift of emphasis. For example, the Coast Guard Auxiliary, with its 47,000 civilian volunteer members, has undertaken a training program that would make its members available for any type of service on the home front that the fortunes of war might demand. The Auxiliary no longer has flotillas of its own craft (privately owned by the members) in operation as waterfront patrol units. Instead it operates regular Coast Guard Reserve vessels. One of the most important developments within the Coast Guard during 1943 was a rapid growth of the Volunteer Port Security Forces, made up of civilians in leading American ports, who have volunteered for duty as guards along essential waterfront installations, thereby relieving a proportionate number of regular Coast Guard personnel for other duty. The authorized strength of the Volunteer Port Security Forces is 19,000 in the

sixteen largest ports.

The main activities of the Coast Guard during 1943 were roughly centered about its traditional functions as America's maritime police force and its wartime emergency operations, as a part of the Navy, all over the globe. Among the latter can be counted the landing of American troops in Sicily and, later, upon the Italian mainland. LST's and LCI's were first used in the former action. To supply trained men to effect the landings, the Coast Guard assigned a great number of its officers and men periodically throughout the year to special amphibious units. Replacements for many of these men were secured from the SPARS. During 1948, the Battle of the Atlantic and the struggle to get American shipping through to Allied ports took a decided turn for the better. The Coast Guard continued throughout the year to contribute to the effectiveness of the convoy escort system used to combat the submarine menace. Two of the more notable actions in this battle were those of the Campbell, a large, sea-going cutter of the 327-foot class, which engaged six submarines in the space of twelve hours on Feb. 22, 1948, and of her sister ship, the Spencer, which captured almost the entire crew of a German submarine after a running gun fight.

With the year 1943 characterized by the increased flow of American men and supplies to foreign battlefronts and a proportionate increase in the volume of shipping going out of American ports, the Coast Guard has been giving concentrated attention to those of its functions relating to merchant ships. Its Division of Marine Inspection, charged with regulating the safety of vessels and crews at sea, has conducted constant investigations, tests, and experiments to improve old lifesaving equipment and to devise new. The Coast Guard

has also regulated the security of vessels while in port and drilled merchant seamen in lifesaving measures. The result of its campaign to promote maritime safety, in the face of the normal hazards of sea being augmented by wartime conditions, has been an encouraging drop in the number of lives lost due to sinkings. The Commandant of the Coast Guard has further integrated the Coast Guard's maritime functions by appointing a Merchant Marine Council within the Service. All those main divisions of the Coast Guard which work primarily with the Merchant Marine are represented on the Council. In order to synchronize the Coast Guard's administrative functions with the shipping industry, the Council is assisted by a panel of consultants selected for their ability in certain fields within the Merchant Marine industry. Such consultants attend conferences that deal with phases of shipping within their fields, and their suggestions are constantly utilized by the Council, which is primarily a fact-finding and advisory body. Thus, the Coast Guard has been able to avail itself of the advice and suggestions of the industry itself before promulgating regulations or establishing policies which affect it. With the war's outcome dependent upon the Merchant Marine, this has brought about a degree of effectiveness in regulating the latter that has proved highly successful.

It is probable that 1943 will represent the peak year of Coast Guard expansion. Beyond replacements, it is not likely that the Service will expand much further under wartime conditions. Meanwhile, it has consolidated its peacetime role of maritime policeman and its wartime role of an operational part of the Navy. It is prepared both in equipment and in manpower to continue the discharge of its particular and general wartime functions without abrogating its many peacetime

activities.

COLOMBIA. A South American republic. Capital, Bogotá.

Area and Population. Area, 439,828 square miles; estimated population, 9,523,200 in 1942 (8,701,-816 at 1938 census). About 10 per cent of the population is estimated to be pure white, 10-15 per cent Indian, 30-50 per cent mestizo, and 30-35 per cent Negro, mulatto, and zambo (Negro and Indian). Among the 34,322 foreigners counted in 1938 were 9,942 Venezuelans, 2,887 Americans, 2,977 Germans, 1,944 British, 1,448 Italians, 1,059 Poles, 1,055 French. Estimated populations of the chief cities in 1942 were: Bogotá, 395,300; Medellín, 198,100; Barranquilla, 183,500; Cali, 121,300. In 1940 Manizales had 90,628; Cartagena, 88,228; Ibagué, 64,830; Cúcuta, 60,194; Bucaramanga, 54,160; Pasto, 51,699.

Defense. Military training for one year and service in the reserve for nine years is compulsory. The army's peace strength in 1941 was 15,850 men; trained reserves, 100,000; active air force, 1,150 men with about 80 planes. Police number

about 5,000. The navy has 2 modern destroyers, 3 sea-going gunboats, 3 coastal patrol vessels, and 4 river gunboats. United States aviation and naval missions were contracted for in 1938 and a military mission in 1942. Colombia's armed forces and coastal defenses were strengthened with the aid of a lend-lease agreement signed in Washington Mar. 17, 1942. This reportedly called for delivery of U.S. war material valued at from \$20,000,000 to \$30,000,000.

Education and Religion. About 19.5 per cent of the urban population and 80.5 per cent of the rural population are estimated to be illiterate. Besides 571 private schools, there were in January, 1942, 525 kindergartens, with 13,400 pupils; 8,562 primary schools, with 570,061° pupils; 185 night schools, with 9,989 pupils; 450 high schools, with 34,599 pupils; 29 religious schools, with 1,657 pupils; 195 pupils; 29 religious schools, with 1,657 pupils; 25 pupils; pils; and 58 preparatory schools and five public universities, with 7,635 students. A School of Business Administration, the first of its kind in South America, was opened in Bogotá Feb. 4, 1943, with cooperation of the Office of the Coordinator of Inter-American Affairs at Washington. Roman Catholicism is the prevailing religion, but the Church was disestablished in 1936. A revised concordat conforming to the 1936 amendments to the Colombian Constitution (see 1936 YEAR BOOK) was approved by Congress in December, 1942.

Production. An unofficial estimate placed the value of production of the chief industries in 1940 at about one billion pesos, divided as follows: Agriculture, 40 per cent; livestock, 20 per cent; factories, 20 per cent; mines, 10 per cent. In 1941 coffee and petroleum accounted for 92.8 per cent of the value of all exports. Colombia ranks second to Brazil as a coffee producer. Coffee exports in 1941 were about 2,912,000 bags (of 132 lb.) against 4,443,000 bags in 1940. The total coffee crop in 1940-41 was 270,000 metric tons; cane sugar, 57,941 metric tons in 1941; cotton, 27,500,000 lb. in 1940–41. Other leading crops are bananas, rice, cereals, potatoes, cacao, and tobacco. There were estimated to be 9,000,000 beef cattle, 1,500,000 horses and mules, and 1,000,000 sheep in 1941. Due to the shortage of tankers, petroleum production declined from 24,639,000 bbl. in 1941 to 10,590,000 bbl. in 1942. The 1942 output of gold, silver, and platinum was valued at about \$23,001,-780. Gold exports amounted to \$11,974,074 in 1942 (\$24,337,143 in 1941); exports of crude platinum, 49,162 troy oz. worth \$1,274,575 in 1942. Coal output, 415,395 metric tons in 1942. As of Jan. 1, 1941, Colombia had 1,541 industrial establishments with an aggregate capital investment of 122,413,000 pesos. The leading industries, in order of the value of capital invested, were: Textiles and yarns, beer, sugar refining, cement, grain milling, cigars and cigarettes, metal manufactures.

Foreign Trade. Including bullion and specie, general imports in 1942 amounted to 104,972,242 Colombian pesos (170,040,000 in 1941) and exports to 185,760,000 pesos (176,160,000 in 1941). The United States supplied imports valued at 62,521,374 pesos in 1942 and took exports valued at 154,741,035 pesos. For values of leading export items in 1941, see 1943 Year Book.

Finance. In the national budget estimates for the calendar year 1943, revenues and expenditures balanced at 122,509,400 pesos (about \$71,055,460). The budget for 1942 closed with a reported deficit

of 7,148,000 pesos.

The public debt on Dec. 31, 1942, was: Internal, 168,000,000 pesos; external, \$56,000,000 (157,-000,000 pesos and \$53,000,000 respectively on Dec. 31, 1941). The Colombian peso exchanged at an average official rate of \$0.57 in 1941 and 1942.

Transportation. In 1942 there were 5,346 miles

of navigable waterways, 1,395 miles of railways (mostly government-owned), over 14,336 miles of highways, and an extensive network of national airlines operated by the government-controlled Avianca Airways. Completion in December, 1941, of a line connecting the Antioquia and Pacific railways provided the first modern transportation link between the Magdalena River and the Pacific ocean (port of Buenaventura). A highway from Cali to the Pacific, completed in 1942, gave the national highway system its first outlet to that ocean. Railways and cableways in 1940 transported 3,017,000 metric tons of freight compared with 898,000 tons transported on the Magdalena River. Pan American Airways provided international air connections through Barranquilla and Cali. The chief ports are Cartagena, Barranquilla, and Santa Marta on the Caribbean and Buenaventura on the Pacific. Also see History.

Government. The Constitution of Aug. 5, 1886, vests executive power in a President elected for four years by direct popular vote and ineligible for reelection for four years after completion of his term. A Congress of two houses exercises the legislative power. The Senate has 56 members, elected for 4 years by departmental assemblies; the Chamber of Deputies, 118 members, elected for 2 years by direct suffrage. Extensive amendments to the Constitution were voted in 1936 (see 1936 Year Book, p. 174 f.). President, Alfonso López Pumarejo (Liberal), who was elected May 1, 1942, and assumed office Aug. 7, 1942. For the Congressional elections and other developments

in 1943, see below.

#### HISTORY

Political Developments. Colombia during 1943 continued the policy of close collaboration with the United States, reflected in the severance of diplomatic relations with the major Axis powers in December, 1941 (see table under WORLD WAR). However the attention of the Government and people was concentrated mainly upon internal political and economic problems until the sinking of a Colombian ship by a German submarine on the night of November 17 led the Senate on November 27 to approve, 33 to 13, a declaration of a state of war against the Reich. On December 3 a Supreme Council of National Defense was created and steps were taken to intern German nationals and defend the country

Elections. The biennial elections to the Chamber of Deputies and the departmental assemblies were held on March 21. The Liberals, who had been in power continuously since 1930, retained control of both houses of Congress. In the Chamber of Deputies, the Liberals won 73 seats against about 50 by the Conservatives. The Liberals were split into the majority left-wing faction led by President mto the majority left-wing faction led by Hesident López, which captured 60 seats, and the dissident conservative wing with 13 seats. For the first time in Colombian history, a Communist was elected to the Chamber. The Liberals also maintained control of 13 of the 14 departmental assemblies. thus assuring the election of a predominantly Lib-

eral Senate in April.

When the newly elected Congress convened on July 20, several Cabinet Ministers came in for severe criticism. Rather than allow Congressional opposition to these Ministers to obstruct the Covernment's legislative program, the entire Cabinet resigned on August 16. The reorganized Ministry appointed by President López on August 24 contained only five new faces and brought no impor-

tant change in Government policy.

Soon afterward a factional struggle developed over the question as to who was to be the Liberal candidate for President in the 1946 election. This led to the resignation of Foreign Minister Gabriel Turbay on September 24 and of Minister of Government Darío Echandía and Alberto Lleras Camargo, Ambassador to Washington, on October 7. The national committee of the Liberal party then intervened to smooth out the quarrels that were delaying Congressional action on needed internal measures. A solution was found through the resignation of the entire Cabinet on October 8 and the appointment by President López the following day of a Ministry giving representation to all Liberal factions. Lleras Camargo headed the new Cabinet as Minister of Government. President López offered to resign to end the dissension within the Liberal party but his offer was refused by the Cabinet.

The new Government was confronted immediately with the problem of ending a serious strike of transport workers which had virtually paralyzed traffic. Clashes between strikers and the police in Caldas led President López on October 8 to declare a state of siege in that department.

On November 19 President López turned over the executive powers temporarily to Acting President Darío Echandía while López took his wife to the United States for medical treatment. The Cabinet again resigned and was immediately reappointed. The declaration of war against Germany

took place while López was absent.

Measures Against Inflation. The foregoing political maneuverings formed the background against which the Government moved to put into operation drastic measures for the control of currency and price inflation and for otherwise safeguarding the national economy against the impact of the war. As described in the 1943 Year Book, the shipping shortage and other war restrictions had greatly curtailed imports into Colombia, while exports of coffee, strategic minerals, rubber, etc., were maintained. The result was a piling up of excess reserves of dollar exchange; a decline in Government revenues, construction, retail sales, and other activities dependent upon imports; a sharp rise in rents and prices; and the spread of unemployment.

To check the inflationary trend, the Government on Dec. 18, 1942, promulgated a law providing for the issuance of up to 60,000,000 pesos of National Economic Defense Bonds and for a drastic increase in taxes to service the bonds. Income, excess profits, and property taxes were raised 35 per cent and inheritance and gift taxes 20 per cent. Moreover, a 50-per-cent surtax was levied on income, excess profits, and property taxes. Proceeds of the bond issue were to be used to pay off the 1942 budget deficit, balance the 1943 budget, and to increase the appropriations for local governmental units, public works, and for promotion of education, social welfare, agriculture, and industry. Investment in the bonds was made compulsory for savings banks, insurance companies, the larger businesses, and the National Coffee Fund. For a detailed analysis of this complicated legislation, see Foreign Commerce Weekly, Apr. 10, 1943, p. 8 f.

This fiscal program was supplemented by a so-called "Economic Plan," adopted by a special session of Congress on February 28 and approved by the President Mar. 2, 1943. This law provided for: (1) The control of prices of essential commodities,

(2) the establishment or subsidization of certain

cooperatives, (3) the creation of a Board of Economic Defense to study certain problems and to propose methods of financing the Government's plans in respect to its recommendations, (4) the establishment of the office of Presidential Auditor to secure better and more economical Government service, (5) the reorganization of the Administration of National Railways and the National Bureau of Transportation and Rates, (6) the possible suspension or modification of the exchange-control system, (7) the issuance of 50,000,000 pesos of internal bonds to stimulate the nationalization of public utilities and of foreign interests under fiduciary administration, and (8) the modification of the organization of official and semiofficial credit institutions.

In carrying out this law, the President on May 11 established the Office of Price Control under a Price Comptroller, assisted by a board of four members representing labor, manufacturers, farmers, and importers. The Comptroller was authorized to issue regulations fixing maximum and minimum prices, to prevent monopolies, institute rationing, arrange for the purchase and sale of commercial articles through the issuance and cancellation of licenses, and issue import and export permits in concurrence with the Office of Exchange and Export Control.

Another decree of June 10 imposed a three-fold check on expansion of the currency by means of (1) compulsory investment of a substantial proportion of company profits in "frozen-deposit certificates," (2) similar investments by importers in amounts equal to one-tenth of their remittances for foreign goods, and (3) the doubling of the legal deposit coverage reserves of the banks. At the same time the Superintendent of Banking barred marginal trading on the stock exchanges. On August 8 the President asked Congress to approve the immediate issuance of the internal bonds called for under the law of March 2, to the amount of 25,000,000 pesos.

Other Internal Events. A serious outbreak of malaria occurred early in the year on the Guajira Peninsula. Doctors and medical supplies were flown to the town of Uribia on the peninsula in mid-January by the U.S. naval attaché în Bogotá. They reported that about 5,000 of the 40,000 inhabitants of the area had already succumbed to the disease.

By unanimous vote of the judges of the Colombian Superior Court, a woman was appointed judge of the Criminal Court in Bogotá on June 13.

Relations with United States. Colombia-United States relations were marked during 1943 by the visit of Vice President Henry Wallace to Colombia in April and by the extension of economic collaboration, particularly in the development of com-munications and rubber production in the Colombian section of the Amazon Basin. The establishment of a Colombian-American commission to supervise the rubber procurement drive was an-nounced February 19. A week later a Bogotá newspaper reported that airplanes were carrying two tons of raw rubber from camps in the Colombian jungle every day and returning with food and supplies for the rubber gatherers.

President López on March 10 issued a decree authorizing the Rubber Development Co. of the United States to construct a road from Villavicencio, capital of the Intendancy of Meta, to Calamar, in the Commissariat of Vaupés, a distance of 218 miles. These and other developments financed by United States agencies in connection with the rubber program helped to absorb a part of the unemployed from other sections of the republic. In August the Finance Minister asked the Colombian Congress to approve a 12-year, 4-per-cent loan from the U.S. Export-Import Bank in an amount equivalent to 14,000,000 pesos. The agreement under which a United States naval mission was sent to Colombia in 1938 was extended for one year through an exchange of notes in July-August.

Other Foreign Relations. The establishment of diplomatic relations between Colombia and the Soviet Union, arranged in 1930 but never carried into effect, was implemented by the exchange of Ministers in 1943. The first Chinese Minister to Colombia presented his credentials in July. The Colombian Government was petitioned to enter the war against the Axis by several departmental assemblies and by the labor unions before the submarine attacks. It kept a sharp watch on Axis citizens and suspected agents, and took steps to nationalize Axis-owned properties under a Presidential decree issued in June. #### COMBAT CAMERA UNITS. See PHOTOGRAPHY.

COMBINED CHIEFS OF STAFF. The Combined Chiefs of Staff are, in effect, the "Board of Directors" of the joint American-British war effort. Eight high ranking specialists in three dimensional war—land, sea, air—compose the Combined Chiefs of Staff.

The four United States members of the group are known as the Joint United States Chiefs of Staff, and between them represent this country's highest command. The four British members are known as Representatives of the British Chiefs of Staff, and reflect the opinions and decisions of the British Chiefs of Staff in London.

U.S. MEMBERS: Admiral W. D. Leahy, Chief of Staff to the Commander in Chief of the Army and Navy; General G. C. Marshall, Chief of Staff, U.S. Army; Admiral E. J. King, Commander in Chief, U.S. Fleet, and Chief of Naval Operations; General H. H. Arnold, Commanding General, Army Air Forces.

BRITISH MEMBERS: Field Marshal Sir John Dill, Head of British Joint Staff Mission in Washington; Admiral Sir Percy Noble; Lt. General G. N. Macready; Air Marshal Sir William L. Welsh.

Responsible to the Combined Chiefs of Staff are the several supporting committees covering every field of military activity. The Combined Staff Planners are concerned with military planning, particularly strategical planning. The Combined Intelligence Committee is responsible for all intelligence matters. The Combined Military Transportation Committee is responsible for shipping and transportation. The Munitions Assignments Board (q.v.) acts in an advisory capacity to the Combined Chiefs of Staff on all supply matters and is respon-sible for the allocation of all finished war material, drawing on the entire munitions resources of the United States and Great Britain. The Combined Communication Board is responsible for matters concerning all phases of communications. The Combined Meteorological Committee is responsible for all matters pertaining to weather forecast.

Any subject not specifically assigned to one of the above committees comes under the cognizance of the Combined Staff Planners.

COMBINED FOOD BOARD (United States, United Kingdom, and Canada). A Board created on June 9, 1942, by the President of the United States and the Prime Minister of Great Britain, to obtain a planned and expeditious utilization of the food resources of the United Nations in order to coordinate further the prosecution of the war. For details, see 1943 Year Book, p. 162. In October, 1943, the Canadian Prime Minister accepted membership in behalf of Canada. Chairman: Claude R. Wickard, Secretary of Agriculture.

COMBINED PRODUCTION AND RESOURCES BOARD. A Board created by the President of the United States and the Prime Minister of the United Kingdom on June 9, 1942, for the most effective use of the combined resources of the United States and the United Kingdom for the prosecution of the war. Members: United States, Donald M. Nelson; United Kingdom, Oliver Lyttelton; Canada, C. D. Howe. For details, see 1943 Year Book, p. 168. See War Production Board under Balanced

Production.

COMBINED RAW MATERIALS BOARD (United States and Great Britain). A Board created Jan. 26, 1942, by President Roosevelt and Prime Minister Churchill to mobilize the raw material resources available to the United States and United Kingdom for the most effective combined use against the enemy The Board is composed of the following: United States Member, William L. Batt, and Executive Secretary, F. M. Eaton (who is also Chairman of the Operating Committee); United Kingdom Member, Sir Charles Hambro, and Executive Secretary, George Archer. For details, see 1943 Year Book, p. 163. See War Production Board under Balanced Production; Hides, Leather, and Shoes.

COMBINED SHIPPING ADJUSTMENT BOARD. See MARI-TIME COMMISSION, U.S. COMBINED TRAINING CENTER. See MILITARY PROG-

COMETS. Comet 1942 (g). This comet was discovered in December, but it was visible to the naked eye during the early months of 1943. It passed through perihelion February 6, and its maximum brightness was magnitude 3.8. It crossed the bowl of the Big Dipper at the end of February and remained visible to the naked eye during most of April.

Comet 1943 (a). This was an unexpected comet

and was discovered on April 17 by Miss Oterma

at the Turku (Finland) Observatory.
Comet 1943 (b). This new comet was discovered at the National Observatory of Bucharest, Rumania, by Diamaca and was independently discov-

covered by Peltier at Delphos, Ohio.

In the course of October two periodic comets were recovered. The first one, Comet Comas Sola' 1927 III, was found by Miss Oterma at Turku (Finland) on October 2. This comet was discovered Nov. 4, 1926. It has a period of 8½ years and this was its second return.

The second one was Comet D'Arrest, first observed this year on October 24 by Van Biesbroeck. This comet was first discovered in 1851 at Leipzig. It has a period of about seven years and was last previously observed in 1928; it was missed on its returns of 1929 and 1936.

COMMONWEALTH FUND. This endowment, established in 1918 by Mrs. Stephen V. Harkness "to do something for the welfare of mankind" now amounts to approximately \$48,000,000. In the year ending Sept. 30, 1943, the Fund appropriated \$1,503,124; more than half was devoted to activities tending to promote or maintain physical and mental health.

Public health activities, designed to raise standards of rural service, centered in Tennessee, Mississippi, and Oklahoma. Fourteen rural community hospitals built or remodeled with aid from the Fund were at work during the year; these hospitals stress opportunities for professional education as well as standards of medical, nursing, and technical service. New construction has been postponed till after the war. Fellowships were offered to instructors in medical schools and provision was made for visiting instructors, without restriction as to field; continued aid was given to departments of preventive medicine and psychiatry, to various forms of postgraduate medical education, and to teaching arrangements designed to promote interplay between pediatrics and psychiatry. More than \$324,000 was appropriated for medical research. The Commonwealth Fund Fellowships for British graduate students at American universities are suspended during the war, but eighteen fellowships for postgraduate study in medicine and public health were made available to Latin-Americans. The Fund continued to aid child guidance enterprises in England; contributed to an advisory service for community mental hygiene clinics in the United States; and published during the year seven books of educational significance in its fields of operation. Since the beginning of the war the Fund has set aside nearly \$1,250,000 for war relief and related purposes. The directors of the Fund are: Malcolm P. Aldrich (president), William E. Birdsall, Phil W. Bunnell, Adrian M. Massie, Lewis Perry, William E. Stevenson, and Thomas D. Thacher. Its offices are at 41 East 57 Street, New

COMMUNICATIONS, Electrical. The Board of War Communications (q.v.) continues in full control of United States communication facilities—wire, radio, and cable. International radio telephone communications to or from points outside the Western hemisphere continue under ban (see Censorship, Office of) except as sponsored by a government agency. Military requirements, and commercial and industrial requirements related to military needs, continue to take priority over civilian requirements, but with little serious interference with the latter. Indicative of the expansion of military communications is the fact that as of June 30, 1943, the Signal Corps of the Army Service Forces numbered some 280,000 men and 28, 000 officers, twice the enrollment of the total peacetime regular Army. As the result of the magnitude of the distances involved in modern military operations and the high degree of mobility of units, radio communications far outweigh wire communications in the current war.

One of the most important developments in the communications industry in some time is the study, initiated late in the year by the U.S. Senate, of the whole pattern of world communications. This study apparently is intended to embrace possible plans of a merger of the United States' international communications companies, and will probe the position in global communications of the British Cables and Wireless. The study is to be conducted by the Senate Interstate Commerce Subcommittee, and is to be of extreme importance and significance to domestic communications as well as

to international communications.

Stimulated by the shortage of copper, coppercovered steel wire was developed for high-frequency communication lines, and found to be as efficient as solid copper wire for such transmission. See also CHEMISTRY under Quartz; PLATINUM;

NATIONAL BUREAU OF STANDARDS.

Radio. The 14 privately owned short-wave broadcasting stations (one built since Pearl Harbor) and eight commercial communications transmitters formerly used for point-to-point telephone, radio program, or radio-photo service, have been leased jointly for the duration of the war by the Office of War Information and the Coordinator of Inter-American Affairs (qq.v.). The 22 relatively low-powered commercial transmitters currently are being replaced by high-powered transmitters. The programs internationally broadcast by these two Federal agencies constitute an integral part of American psychological warfare. Office of War Information's international message, the "Voice of America," is aimed at five listening groups: enemy areas, Axis-occupied areas, neutral countries, the United Nations, and Allied-occupied areas. It is heard 24 hours a day in more than 40 languages and dialects in a total of more than 3,200 quarterhour productions per week. See also EDUCATION, U.S. OFFICE OF and CIVILIAN DEFENSE.

The U.S. Army now is using more radio equipment than was manufactured for the entire nation during peacetime. Total radio production in the United States, which about a year ago stood at a level of about \$30,000,000 a month, currently is up to \$250,000,000 a month—representing a rate of increase considerably in excess of that of general war production. All such production is for the armed services, which use many radio-electronic devices in addition to radios for tanks, aircraft, battleships and other naval craft, field sets for the Army, radio compasses, direction finders, altime-

ters, and other devices.

The Federal Communications Commission (q.v.) has made an inventory of excess radio equipment possessed by radio stations, and catalogued this equipment for the benefit of stations wishing to purchase equipment, thus avoiding the placing of many orders with manufacturers already overtaxed by war orders. At the suggestion of the War Production Board, Federal Communications Commission issued an order under which all domestic broadcasting stations, without disturbing service, effected operating changes as a wartime means of extending the life of transmitter tubes. War Production Board also simplified and standardized parts for home radios and similar equipment, to

assure wider maintenance and repair. In May, 1943, the U.S. Supreme Court ruled that the Federal Communications Commission has the power to force its regulations on the industry, thus confirming and consolidating the series of reforms imposed upon the industry during the past two years. Among the more important of these requirements are: (a) Stations affiliated with one network cannot be prevented from carrying programs of other networks; (b) network programs rejected by any affiliated station may be offered to any other station in the area of the affiliated station; (c) chains no longer can require affiliated stations to accord "exclusive option time," thus giving individual stations a greater degree of control over their more desirable program hours. See Law under Supervision of Federal Agencies.

For ship stations, single-cabinet units were developed which provide both high-frequency and intermediate-frequency communication facilities in one "package." Thus, all the components re-quired for a 200-watt dual transmitter for a complete ship radio station are, with the exception of batteries and antennas, all mounted in a single cabinet approximately 87 inches wide, 72 inches high, and 19 inches deep. As it has been found in many cases that low-frequency radio signals penetrate atmospheric disturbances better than do the higher frequencies, special low-frequency continuous-wave transmitter equipment has been designed for use in Arctic regions where severe atmospheric disturbances are encountered. Several transmitters of this special design have been put into service by the Civil Aeronautics Administration.

"electrical camouflage" may be thrown around a radio broadcasting station by means of newly developed electronic equipment. It is claimed that by such means a broadcasting station can be "concealed" to a degree that should make it unnecessary for such station to go off the air at times of approaching air raids.

INFORMATION OMITTED AT THE REQUEST OF THE U.S. WAR DEPARTMENT

INFORMATION OMITTED AT THE REQUEST OF THE ILS. WAR DEPARTMENT

INFORMATION OMITTED AT THE REQUEST OF THE U.S. WAR DEPARTMENT

For developments in the broadcasting industry, see Radio Programs. See Illumination.

Telegraphy. By mid-year 1943, monthly receipts for domestic telegraph showed an increase of some 70 per cent over the level prevailing in January, 1940. Some of the greatest expansions have been in private-line service between defense plants and government agencies, and in tie-lines in defense areas. Like long-distance telephone calls, tele-

grams are on a priority basis.

To implement the merger of the Western Union and Postal Telegraph Systems, which was consummated during the year, the FCC (q.v.) authorized the new domestic consolidated telegraph company to eliminate some 1,800 duplicate tele-graph offices throughout the country. Meanwhile, the American Telephone and Telegraph Company is reported as completing an inventory of its TWX and leased-wire services, with a possible view to-ward selling them to the consolidated Western Union Telegraph Company, although no formal propositions are known to have been submitted by either

Although the war interrupted submarine cable communications of American companies between the United States and Europe and Far Eastern points, direct facilities still are available to the British Isles, Portugal, Gibraltar, the Azores, Hawaii, and Midway. Also, there is complete cable service in the Western hemisphere uninterrupted by the war, to the West Indies and along both coasts of South America, and to Alaska where the submarine cables have been modernized to carry heavy traffic. On the basis of the number of messages, it is estimated that 65 per cent of the world international telegraph traffic currently is handled by cable, and 35 per cent by radio. Domestic radiotelegraph traffic continues to be suspended under war security regulations to obviate foreign pickup. In spite of the discontinuance of direct radio and telegraph communication with many European countries, international radiotelegraph service to and from the United States has expanded greatly since the beginning of the war. For example, prior to Pearl Harbor, radiotelegraph communication between the United States and Australia was relayed via Montreal. Now, the traffic is routed over direct circuits. Since 1939, new direct radiotelegraph circuits have been established. lished to Egypt, Iceland, Paraguay, Bolivia, New Caledonia, Greenland, New Zealand, Iran, French Equatorial Africa, Belgian Congo, Algiers, British Gold Coast, Bermuda, Afghanistan, and to numerous points in the European and Asiatic Union of Soviet Socialist Republics and unoccupied China. A direct radiotelephone service between New York City and Moscow was established late in the year by the American Telephone and Telegraph Com-

pany, to operate on an FCC-approved initial rate of \$21 for three minutes. As the circuit crosses over the "top of the earth" near the magnetic pole, several months of test and experimentation

were involved in its development.

As a war service, a special "Expeditionary Force Message Service" was established for both cable and radiotelegraph circuits; 104 fixed texts were established, the combination of any three of them offering the sender a means of covering nearly all occasions for a standard rate of 60 cents or its equivalent in other currencies. This is purely an overseas service for the benefit of the members of the American Expeditionary Forces and the persons communicating with them.

See National Labor Relations Board.

Telephony. Rated as the last important competitive telephone system in a major American city, the Keystone Telephone System, serving the city of Philadelphia and a few counties in southern New Jersey, was approved by the Federal Communications Commission (q.v.) for acquisition by the Bell Telephone System. The 13,800 Philadelphia customers of the Keystone system were to be taken over by the Pennsylvania Bell Company, but only about 14 per cent of these will be new Bell System customers, as the remaining 86 per cent also were Bell subscribers. The subscribers in southern New Jersey counties were to be taken over by the New Jersey Bell Company.

One of the interesting developments of the year in new communication circuits is the 2,000-mile combined voice and telegraph circuits built as a part of the Alaska Highway (q.v.). Because of the imminence of tree and storm trouble, this line was strung with high-strength steel-core wire. There are two pairs of conductors, and over each pair of wires there will be provision for a d-c telegraph circuit and a carrier system providing two channels for voice and 12 telegraph channels to be used for telegraph service. In general, the carrier channels will be used for through transmission, while the d-c telegraph and the voice circuits will be used for point-to-point communication along the route and for necessary mainte-nance communications. Ten repeater stations are

required to keep transmission up to desired levels. The fact that 10,000 new business telephones were connected during the first eight months of 1943, as compared with 52,000 loss during the same period of 1942, reflected the improved status of small business concerns. As the result of restriction orders, the number of residence telephone extensions decreased by 54,000 during the eightmonth period. By the year-end, approximately 600,000 unfilled applications had accumulated as the result of limitations in available facilities. In spite of this, the net gain in total telephones connected amounted to 1,200,000, five out of six of which were residence installations. A half-million of the old-style desk telephones were salvaged from the discard and put back into service.

Long-distance lines of the Bell system were estimated to have handled some 729,000,000 toll messages during 1943, and it is expected that some 809,000,000 will be handled during 1944, almost double the figure for 1939. Bell system engineers estimate that, to handle this volume of traffic at the same level of speed and service that prevailed in 1943, the system would require 25 per cent more new toll circuits than are expected to be available under prevailing limitations of men and materials. Toll calls out of Washington, D.C., alone now are reported to average some 42,-000 a day, as contrasted with 24,000 a day just

before Pearl Harbor. Under war conditions the speed of handling toll calls has declined steadily—1.6 minutes average in 1941, 2.3 in 1942, 3.7 in 1943.

Incidental to long-distance telephone service, two "firsts" were recorded, indicating at least something of the trend of postwar developments. In Philadelphia the first dial-type toll-switching system in the United States was placed in service during the late summer and early fall. The system enables the toll operator in one city to ring a called telephone in another city directly, without the help of an intervening operator. To the telephone subscriber, this system means faster service on long-distance calls; to the telephone system it means less time lost on busy circuits. A total of approximately 2,000 circuits were initially cut in to the new Philadelphia system. At Culver City, Calif., the first automatic toll-ticketing office in the country was put into service. This equipment is particularly significant with respect to large metropolitan areas where many relatively short-distance toll calls between communities are involved, and where, under presently prevailing systems, the subscriber must suffer the delay of dialing an operator to establish the connection. With the new automatic toll-ticketing equipment, it is possible for an extended-service subscriber in Culver City to dial a subscriber in nearby Los Angeles or other adjoining communities with the same ease and facility that a local dial call can be made. The complete record of the call is made by the message-ticketer, saving the operator the time and effort required to write out a toll ticket long-hand.

According to present estimates there are about 26,500,000 telephones in the United States, some 17,000,000 of which are residence telephones. About 21,500,000 of these instruments belong to the Bell System; the remaining 5,000,000 to the 6,300 independent telephone companies and the 60,000 rural or farm lines. As of the year-end, it was expected that sufficient telephones will continue to be available to take care of all "essential" telephone users as defined by WPB and to provide for what the Board calls "essential growth." In some areas, however, additional telephone service for civilian consumers has been possible only by "degrading" the service—changing over to party-

line service. Illustrative of telephone systems developed and operated by the Signal Corps of the Allied Nations is the modern telephone network which now links the ancient city of Baghdad in Asia with the city of Tunis in northwest Africa. This is strictly a military network, built by the (British) Royal Corps of Signals, the lines of which cross 3,765 miles of desert terrain. The system includes three main exchanges and several smaller ones, and more than a score of repeater or amplifying stations along the route. Most of the repeater stations are far-removed from civilization, and each has its own power plant, water tanks, and cooking facilities. In many instances, food and water must be carried as much as a hundred miles. The exchanges involve the most modern equipment, and are, for the most part, in air-conditioned buildings, and staffed by girl operators. The network provides carrier (multi-channel) type of equipment, with stand-by lines for emergencies. As the North Afri-can war progressed westward, battle headquarters were constantly linked directly with Cairo and other strategic points by means of the network. See also Lend-Lease Program.

Another development of military significance is a carrier-system developed in conjunction with the

U.S. Army Signal Corps and suitable for distances up to 150 miles or so. The system centers around a special cable designed for rapid and simple installation as well as ease of operation. The system provides four telephone circuits, one of which will ordinarily be used for voice-frequency telegraph operation to obtain four duplex telegraph circuits. In addition two simplex circuits are provided. The cable is a special four-wire rubber-insulated cable with loading coils at the junction points of the quarter-mile cable sections. One pair of conductors serves to transmit in one direction, the other pair in the opposite direction. Still another significant military development is a common-battery cradletype telephone set, especially designed with respect to moisture-proofing and performance under difficult weather conditions, for use in tropical areas such as abound in the Pacific war zone. An evidence of Yankee resourcefulness is reported from Iceland where U.S. Army Signal Corps technicians are reported to have collected toothpaste tubes from camp and community to combine the salvaged tin with available lead to provide an improvised solder that was badly needed for rush work.

A new sound-recording machine was announced in New York City late in 1943. This device, reported as a compact affair not much bigger than a portable radio, makes records on cellophane tape. These records are reported to be first-class as to tone, and superior to any previous records in durability, ease of production, and low cost. The high-fidelity cellophane record is reported to cost only 50 cents per hour of recording to make, and to be satisfactorily playable several thousand times.

satisfactorily playable several thousand times.

Television. Broad claims were made for a new system of television broadcast, announced late in the year by Dr. Palmer H. Craig, head of the Department of Electrical Engineering at the University of Florida, in speaking before a group of television experts at the Yale Club in New York City. By getting rid of the present "scanning" principle of television cameras, the new system was declared to be free of all of the major technical difficulties that have beset television to date. Claims are (a) that instead of being limited essentially to the visual horizon, it will broadcast television programs over distances comparable to radio broadcasts; (b) that it will eliminate the necessity for the supremely high-powered illumination required to secure clear images with present television cameras; (c) that it can make use of the same wavelength as radio, instead of being limited to the high-frequency range; (d) that it will greatly reduce the cost of television broadcasting.

The current system of translating an image into electrical impulses for television broadcasting involves the use of a television camera, which "scans" the whole image in a series of 240,000 or more separate impressions, recorded in series all within the space of one-thirtieth of a second. This system requires lighting rivaling direct sunlight, and requires a wide band of frequencies the room for which can be found only in the high-frequency broadcasting range. In the proposed new system the "scanning" problem is simplified by a device which records the 240,000 separate divisions of an image simultaneously instead of in sequence. The result is a complex wave of 240,000 elements that, it is claimed, could be broadcast with relatively little power on a relatively narrow wave-band, and would be unscrambled by a "scanning" device in the receiver. So far, only the separate elements of the proposed equipment have been evolved, the proposer hoping that the

vision industry can be interested in this new and seemingly simplified system before it becomes too heavily involved in developing and promoting the system and equipment as currently understood.

For the benefit of wounded service men in hospitals in the New York metropolitan area, the National Broadcasting Company and the New York Telephone Company made joint use of their respective facilities October 25 to broadcast the annual Rodeo from Madison Square Garden. Special amplifier and equalizer equipment was used in adapting the telephone lines to the transmission of the television signals. Although technical difficulties are involved, it seems possible that telephone lines and cables may become as closely associated with postwar television broadcasts as they now are with radio-sound broadcasts. Automatic radio-relay stations also are envisioned for interstation television transmission.

COMMUNITY CHESTS AND COUNCILS, Inc. A national membership association of community and war chests and councils of social agencies, organized in February, 1918, as a national clearing house of ideas and service for community chests and councils of social agencies. For description see the Year Book for 1939. Of the 946 community and war chests and councils of social agencies in operation by the end of 1943 (683 chests and 263 councils) 652 chests and 247 councils were in continental United States, 2 chests and 2 councils in the territory of Hawaii, 27 chests and 14 councils in Canada, and 2 chests in South Africa. All but two cities of 100,000 population and over in the United States have community chests or similar plans. Approximately fifteen and a half million contributions in 649 cities provided a total of \$162,334,486 for community and war chests to be used for private social work in their communities and for domestic and foreign war relief during 1943.

The officers of the association in 1943–44 were: honorary president, Gerard Swope, New York City; president, E. A. Roberts of the city of Philadelphia, Pa.; vice-presidents, Col. Robert Cutler, Washington, D.C. and Harry P. Wareham, Rochester, N.Y.; treasurer, J. Herbert Case, Plainfield, N.J.; secretary, Lynn D. Mowat, Los Angeles, Calif.

COMMUNITY TRUSTS. On Dec. 31, 1942, 76 community trusts and foundations in continental United States, Canada, and Hawaii, held principal resources totaling \$56,036,000 compared with \$54,-275,000 at the previous year end. Funds of the Chicago Community Trust aggregated \$10,600,000 while the New York Community Trust's capital was \$10,036,487. The Cleveland Foundation had assets of \$8,147,103; the Permanent Charity Fund, Boston, \$5,689,515; the Winnipeg (Canada) Foundation, \$3,456,581; and the Indianapolis Foundation, \$2,597,100. Sizable trusts were located also in Minneapolis, Richmond, Philadelphia, Buffalo, and Los Angeles.

For the twelfth consecutive year combined disbursements exceeded one million dollars, totaling \$1,725,095 compared with \$1,605,801 paid out in

1941. The New York Community Trust's allocations totaled \$547,262. Corresponding appropriations were \$242,941 in Chicago, \$235,300 in Boston, and \$222,450 in Cleveland. Foundations in Indianapolis, Winston-Salem, and Winnipeg also made substantial outpayments. During 1942, the Cleveland Foundation increased its capital funds with additions totaling \$1,445,580, while the New York Community Trust received \$423,390 in new funds. New Haven, Philadelphia and Providence, R.I., also reported appreciable capital increases. Thomas M. Debevoise and Winthrop W. Aldrich

Thomas M. Debevoise and Winthrop W. Aldrich are respectively Chairmen of the Distribution Committee and Trustees' Committee of The New York Community Trust. Ralph Hayes is the Director with offices located at 120 Broadway, New York

City.

conciliation service, u.s. During 1943 the Conciliation Service continued its efforts to bring harmonious labor-management relations to the nation's wartime economy. This was a larger task than in previous years because of a new realization throughout the country of the value of labor-management harmony in meeting production schedules.

harmony in meeting production schedules.

From Jan. 1, 1943, to Dec. 1, 1943, the case load of the Service increased 60 per cent over the similar period in 1942, reaching an all-time maximum; 12,396 disputes were settled involving more than four million workers. In other words, the Service settled an average of 37 disputes a day during this period. More Commissioners of Conciliation were employed than at any previous time, and a number of changes were instituted, such as the establishment of offices for twelve Regional Representatives to effect cooperation with the National War Labor Board (q.v.), and the decentralization of three of the five Conciliation Service regions. Additional work was undertaken both by the technical and arbitration units. The arbitration unit handed down more awards than at any other time. The technical unit extended its service into a total of thirty-five industries, answering increased demands for information on job evaluation, classification, and wage incentive methods.

The decentralization of the Service was initiated following general patterns of current governmental procedure. The Chicago area was the first region to be decentralized. This program was set up in April with the San Francisco and New York decentralization programs following in October and December respectively. It is hoped that this plan will effectuate faster and more efficient service to

both industry and labor.

During the first eleven months of 1943 the Serv-

ice answered requests of employers, employees, and other interested parties, and disposed of 13,-555 situations involving 5,018,364 workers. Of these situations 1,804 were strikes and lockouts involving 754,060 workers; 10,592 were threatened strikes and controversies involving 3,933,243 workers. During this time 3,608 disputes were certified to the NWLB; jurisdiction was assumed by other agencies in 642 others. The remaining 3,032 situations included investigations, technical services, arbitrations, requests for information, consultations, etc.

The facilities of the Service were used in 29 major industrial fields, and in 48 States, the District of Columbia, Alaska, Puerto Rico, Hawaii, and the

Virgin Islands.

CONSTRUCTION INDUSTRY. As a result of the initiative, energy, and speed which the construction industry exerted in meeting war emergency conditions, the peak of construction for war purposes has been passed, and there is a definite reduction of work and expenditures. This exceptional development in construction has included many and varied camps and barracks, munitions plants, manufacturing plants for war equipment and supplies, water supply and sanitation facilities for the troops, hangars, air fields and bases, roads, railways and freight yards, docks, shipbuilding yards, and innumerable other structures and facilities, great and small.

**NEW U.S. CONSTRUCTION ACTIVITY** 

New construction in the United States for the first half of 1943 was 24 per cent below the figure for the first half of 1942, and 40 per cent below that for the second half of 1942. And this trend continues as the needs for war and defense become more fully met. Reduction of war construction work at home was begun in 1942 by the War Production Board, which proposed to limit the 1943 expenditures for this purpose to 60 per cent of that for 1942.

The grand total cost of all construction for the year 1943, as presented in the records compiled annually by Engineering News-Record was approximately \$5,000,000,000, as compared with \$11,500,000,000 in 1942. The original estimate for 1942 was \$12,821,000,000, but the lower figure covers corrections for contracts canceled and changes announced by the WPB after the estimates had been made. The classification of total construction expenditures for 1943, as shown by these records, and as estimated for 1944, is given in Table I.

TABLE I—VALUE OF U.S. CONSTRUCTION (Add 000,000)

|                                    | 1942      | 1943      | 1944    |
|------------------------------------|-----------|-----------|---------|
| Grand total, all construction \$   | 12,821    | \$5,000   | \$3,500 |
| Engineering construction           | 9,306     | 3,580     | 2,750   |
| Classification of engine           | ering con | struction |         |

| Waterworks and treatment plants    | 151       | 50        | 50      |
| Unclassified; airports, air bases, |           |           |         |
| shipbuilding yards, etc            | 2.035     | 900       | 810     |
| Total engineering construction     | 9,306     | 3,580     | 2,750   |
|                                    |           |           |         |

Under the spur of war emergencies the construction industry has initiated many new ideas and methods in order to expedite work. Concreting on roads (q.v.) and buildings in severe winter weather (even at 30 below zero) has been carried on successfully, while new equipment and new and modified methods have been developed in the construction of bridges (q.v.), large buildings, and other works. It is to be noted also, that the enormous increase in shipbuilding (q.v.) (from 1,000,000 tons in 1941 to about 20,000,000 in 1943 and about the same probably for 1944) were made possible by the entry of civil engineering personnel into the shipbuilding industry and the resultant application of new methods, new ideas, massproduction, and prefabricated assembly, which together have revolutionized established shipbuilding practice. One curious development has been the building of warships by men and organizations whose normal work has been in heavy civil-engineering construction.

Construction on both public works and private projects will be of vital importance during the postwar period; that is, from the cessation of fighting until the return to normal peacetime conditions. This industry will then form a vast reservoir of employment to absorb the men released from the fighting forces and auxiliaries and also those released (temporarily or permanently) from munition plants and other war activities. It has special advantages in that it will absorb men of varied capabilities: laborers, foremen, skilled and unskilled mechanics, surveyors, engineers (from field men to consultants), superintendents, office men,

and others.

But to provide such employment, there must be work ready to be undertaken. And to have these projects ready when needed, it is imperative that preliminaries should be attended to in advance—definite surveys and plans prepared, estimates and drawings made, specifications written, necessary land or right-of-way acquired, legal matters disposed of, and complete arrangements made for financing. If these preparatory matters are deferred, they will require considerable time while men are waiting for or looking for employment, and contractors are waiting to sign contracts.

Two important aspects of these postwar develop-

ments are the character of the projects and the methods of financing. As to the first, the works to be constructed must be necessary and useful, not mere jobs for relief. The financing should be largely local, and free from the attitude of applying to the State and Federal governments for loans and grants. Most States and municipalities have programs more or less definite and complete, and more or less of a long-term character, and there will be also large and small private contracts, but a considerable number of these projects, of both classes, are still halting in their very early stages, and are vague as to details.

A report of the American Society of Civil Engineers pointed out that preparation of a nationwide construction program is essential, in advance of actual peace conditions. Refusal of Congress, in June, to provide funds for continuance of the National Resources Planning Board eliminated the proposed six-year program for postwar Federal public works. It is estimated that private enterprise, if not hampered by the Federal government, will go far to provide the necessary amount of employment. Labor organizations have been urged to use their influence in getting local works advanced to the point of readiness for contract letting

the point of readiness for contract letting.

Economists in the U.S. Department of Commerce estimated that a national annual income of \$150 billion will provide employment for 55,000,000 Americans who will want occupation after the war. And, furthermore, that such income would support an annual construction program of \$26 billion, including \$16 billion for local, State and Federal expenditures on roads, institutions, equipment, etc., and \$10 billion for building construction. The Engineering News-Record estimated 15 per cent of the above income (say \$22 billion) as the maximum available for total construction, and 66 per cent of this latter figure (say \$15 billion) for engineering construction. Its classified estimate, however, keeps within these maximum TABLE II—VALUE OF POSTWAR CONSTRUCTION

COORDINATOR OF INTER-AMERICAN AFFAIRS, Office of the. The Office of the Coordinator of Inter-American Affairs was created by Executive Order on Aug. 16, 1940, to coordinate the activities of governmental and private agencies in the inter-American field. At first, all activities were motivated by two considerations—the emergency aspect of hemisphere defense, and the long-term

aspect of sound economic development of the Western Hemisphere, all based on mutual understanding and cooperation.

After Pearl Harbor, and the war declarations, came the third emergency conference of the Min-isters of Foreign Affairs of the American republics, at Rio de Janeiro. The resulting Rio Charter immediately became the blueprint for all inter-American activity, because it committed the 21 American republics to a program of vigorous cooperation in military affairs, control of subversive activities and Axis propaganda, health and sanitation, transportation, communications, education, and general economic development.

The 1943 operations of the Office of the Coordinator of Inter-American Affairs can be grouped, in general, into two broad categories-economic development, with attendant health, sanitation, and food programs, and informational activities. The Rio Charter visualized the well-being of all the peoples of this hemisphere as a fundamental goal and this is the chief concern of the basic economy program of the Coordinator's Office. Although this program sprang from the necessities of wartime development, in connection with the production of strategic materials and critical supplies for war purposes, it also aims to lay a basis for long-range benefits.

The basic economy program has three major objectives: safeguarding the health of United States military forces stationed in the other republics; maintaining conditions of health and food supplies for workers engaged in increasing production of strategic and critical materials; and maintaining economic stability in those countries whose economies have been dislocated by the war. During 1943, these objectives were carried out in three programs-health and sanitation, food supply, and

emergency rehabilitation.

Health and sanitation work is developed jointly with the governments of the participating republics, and it includes disease control—particularly malaria—drinking water and sewage disposal projects, and educational programs for training nurses, health, and sanitation specialists. Control of malaria and other tropical diseases is a most urgent problem in connection with the production of strategic materials in tropical regions. To combat these deterrents to production, cooperative projects for the construction and maintenance of hospitals, dispensaries, and health centers have been organized. Health and sanitation agreements have been signed with 18 of the other American republics, among which the program in the Amazon Basin in connection with rubber production is representative.

The food supply program centers largely in regions where the war has made military concentration necessary, especially in the region of the Panama Canal. The drastic curtailment of transportation facilities, especially ocean shipping, has brought about serious localized shortages in some countries. Migration of workers to areas where production of strategic materials is in progress further aggravates the situation. Chief objective of the food supply program is to make those countries among our southern neighbors that face food shortages more self-sufficient by increasing both the variety and quantity of food production.

The primary purpose of economic development activities in the Office is to promote commercial relations and to assist in the maintenance of the basic economic stability of the Western Hemi-sphere. The blacklist of Axis business representatives, promotional work to increase the production of strategic materials, assistance in the elimination

of Axis interests in hemisphere air lines, are repre-

sentative past accomplishments.

Such transportation problems as received special attention during 1943 were primarily directed toward assisting the other republics in their contribution to the United Nations war effort through accelerated movement of strategic materials to the United States. Somewhat typical of such projects is the Mexican Railway Mission. This program was undertaken to assist the Mexican government in strengthening its national railway system and to facilitate the handling of greatly increased tonnage of critical war materials. A technical mission of transportation specialists was sent to Mexico. This mission, in cooperation with Mexican transportation officials, has greatly speeded up the transportation of war supplies to the United States. All such projects are worked out in close cooperation with other governmental agencies, as well as with the governments of the other American republics con-

An important work during 1943 was the encouragement of an advertising program for newspapers. magazines, and radio in Latin America. The normal advertising income of these communication agencies has necessarily been curtailed by industrial conversion to war production in the United States and the curtailment of civilian exports. The cooperation of United States industry was enlisted in maintaining their advertising in the other countries, and 90 per cent of the 1,500 firms approached are

cooperating in the program.

Administration of the inter-American training program was another phase of economic develop-ment work during 1943. This training program included industrial scholarships and fellowships, financed for one- or two-year periods by private industry in such representative fields as construction and roadbuilding, transportation, mining, food products, communication, power, commerce, finance, agriculture, and general manufacturing. This training administration also cooperates with the War and Navy Departments in training men from the other republics in military aviation and in naval activities. It administers a basic economy training program for workers and specialists who come to the United States for special training in such fields as medicine, public health, hospital administration, nursing, sanitary engineering, and the biological sciences.

The informational activities of the Office concentrate on the exchange of all types of knowledge and information that will aid mutual understanding and unity among the republics of the Western Hemisphere. Radio, the press, magazines, motion pictures, and educational projects are the chief media used. Supplementing the regular commercial services in their specialized fields, the information division gives wide distribution to news of inter-American significance, articles, news-pictures, posters, display placards, and pamphlets. The Office also publishes an illustrated magazine, En Guardia, in Spanish and Portuguese for distribution to a selected list of more than 500,000 subscribers in the other Americas. En Guardia is also published in a quarterly edition in French, for distribution in Haiti. Pamphlets are published in Spanish, Portuguese, and English on a wide variety of significant hemisphere subjects. An illustrated booklet series on the other American republics has achieved a wide reader interest throughout the United States.

In radio, the coverage is equally complete. During 1943, the people of Latin America could listen for approximately eight hours each day to broadcasts of an inter-American nature in Spanish, Por-

tuguese, or English. Besides news broadcasts, for which a special inter-American news report is provided on a 24-hour daily, seven-days-a-week basis, other programs are broadcast or transcribed for re-broadcast over local stations. These include special events, important speeches, anniversary programs, interviews with visitors from other countries, as well as dramatic programs. More than a score of these programs are serial in nature. Domestic networks and stations have cooperated with this Office in broadcasting programs which give the people of the United States a better understanding of their southern neighbors. Special scripts dealing with the history, culture, resources, and war activities of the other Americas were furnished weekly during 1943 to more than 500 domestic radio stations. The net result of all this is that dozens of radio programs, dramatizing the progress of the war as it involves the Western Hemisphere, as well as programs of historical and cultural significance to all the American republics, are "on the air" today.

Motion pictures have been widely used to carry the message of hemisphere solidarity to millions throughout the Americas. Distribution is made through regular commercial channels, as well as through private organizations, schools, clubs, and churches. Newsreels in Spanish and Portuguese are released weekly. The program of production and distribution of 16 mm. nontheatrical films, mostly educational and documentary in nature, was greatly furthered during 1943. Subjects included war production, resources and culture of the United States, health programs, agriculture, transportation, industry, and postwar topics. For distribution in the United States, film subjects include materials on the history, customs, resources, and war activities

of the other republics.

Among the information projects during 1943 were the tours of some 90 leading newspaper publishers, writers, and editors from Latin America, who came in small groups of from 3 to 10 at the invitation of the National Press Club. These journalists made conducted circle tours of the United States, personally inspecting United States war activities, military camps, cities and agricultural regions, medical centers, libraries, and educational institutions. They also had many opportunities to interview governmental, industrial, and professional leaders.

The educational projects of this Office strive to unite hemisphere educators in a solid program of collaboration in educational matters, so that all will join in the study of the individual republics, their culture, their history, their resources, their peoples, and their needs. The first conference of ministers of education of the American republics and the inauguration of the Inter-American University-both of which events took place in Panama City in September, 1943—perhaps are indicative of the trend in educational cooperation.

During 1943, the Inter-American Educational Foundation was organized by the Coordinator's Office to develop a comprehensive cooperative educational program with the other American republics. This program will be directed at elementary and secondary school levels, teacher training institutions, and the reduction of adult illiteracy. The basis of cooperation will be through the ministries of education and existing educational organizations. Reciprocal agreements will call for joint contributions of funds, materials, and educational specialists. Development of inter-American teaching materials, construction of curricula, vocational, agricultural, and health education, and the training of teachers in Western Hemisphere languages are tundamental to the program. In languages, which are absolutely essential for any and all inter-American understanding, much has already been accomplished. The great increase in the study of Spanish and Portuguese in the United States during 1943 was equalled only by the interest in the

other Americas in the study of English.

Other activities include inter-American demonstration centers, consultant services to teachers and schools, the preparation and distribution of teaching aids, inter-American institutes and lecture series on inter-American affairs in colleges, and universities, a national discussion contest on inter-American topics, inter-American workshops in summer schools, development of inter-American materials to supplement textbooks, and the exchange of . students and educators among the American republies through scholarships and invitational travel

fellowships.

Closely related to educational activities is the wide and varied work of the Division of Inter-American Activities in the United States. This work assumes that effective cooperation among the republics is dependent upon mutual understanding among the people themselves, and that such understanding can only be founded on informed public opinion. The major function of this program is to encourage the active participation of community groups and organizations in affairs of inter-American import and significance, and to make available to such groups and to interested individuals reliable informational materials—pamphlets, motion pictures, speakers, graphic materials, and exhibits.

Nelson A. Rockefeller.

### COOTIES. See INSECT PESTS.

COPPER. Severe restrictions on use, reduced consumption for the manufacture of certain types of ammunition, and maintenance of mine production combined in 1943 to take copper out of the severe shortage classification and into near balance with requirements. Even essential civilian industry adopted a patch-and-pray policy in order that vast tonnages could be available for production of brass and bronze so vital to ordnance and other war material. Utilities, for instance, cut their consumption of wire, cable, and bus bar 72 per cent by value from 1940 levels, and salvaged from plant seven-eighths of this remaining consumption.

The controlling factor in copper consumption in 1943, as in any war year, was the war machine's appetite for brass and bronze, the former typically composed 70 per cent of copper, the latter as much as 90 per cent. An ambitious program to substitute steel cartridge cases for brass was halted December 1, the steel cases never having proved entirely satisfactory. Balancing this renewed demand in 1944 will be quantities made available by sharp curtailment of small arms ammunition manufacture. If the supply-demand relationship of copper continues to improve, there is prospect that other changes will be made in war products shifted away from copper, such as marine fittings. Severe restrictions upon copper for any purely civilian use were continued by the War Production Board throughout 1943 and show no signs of lessening. Any surplus of production over urgent requirements is being placed in a government stockpile, now variously estimated to total from 200,000 to 400,000 tons

Frantic efforts to stimulate new domestic production definitely slowed down toward the end of

the year, however, WPB announcing that no more applications for special premium prices would be accepted after December 31 because of "successful efforts towards balancing the copper supply with requirements of the armed services and the most essential civilian uses." This meant that individual mines no longer could apply for production quotas to be set, above which the government would pay them a price premium of at least five cents per lb.—and in certain cases as much as 14½ cents per lb.—above the market price of 12 cents. This system is the price of 12 cents. tem, known as the Premium Price Plan had been in effect since February, 1942, for copper, lead, and zinc mines. Until the spring of 1943, only the 5-cent premium was available to copper mines. The 14½-cent premium then was announced to enable reopening of high-cost mines and the development of low grade ore reserves. More than 2,000 quotas have been assigned to copper, lead, and zinc mines by a committee including representatives of the War Production Board and Office of Price Administration, and these will remain in effect even though newcomers will be turned away. Premium prices have been paid, generally, only for production in excess of 1941 levels; therefore, most copper production has been made without benefit of premium price, only the marginal output reaping this added reward.

Arizona is conceded to have produced more copper than any other State in 1943, the big Morenci open-pit mine of Phelps-Dodge Copper Corp. turning in its first full year's production. The output of Utah Copper Co., whose mammoth Bingham Canyon operations are the country's largest, undoubtedly made Utah a strong second. Anaconda pushed Montana up to third place, and New Mexico, Nevada, and Michigan produced substantial tonnages. United States production was supple-mented materially by imports from Chile, the largest Latin American contributor, with a steady flow from Peru and Mexico. One Mexican project, the Gran Cananea just south of the United States border in Sonora, will not come into production until well into 1944. Operated by an Anaconda subsidiary, the \$15,000,000 project will exploit a large body of low-grade ore, and will count as a

major producer.

<sup>\*</sup> Includes deliveries on duty paid foreign copper.

The principal limiting factor on mine output in 1943 was lack of labor. Concentrated recruiting campaigns by the War Manpower Commission, in which mining was given top priority over all other industry in referral of job applicants west of the Mississippi, were barren in result, and the same final desperate remedy that was applied in 1942

was repeated in 1943—the release of soldiers with mining experience to work in the mines. More than 4,500 soldiers were released in September to mo-

lybdenum, copper, and zinc mines.

Fired cartridge cases, undesirable for many uses because of acquired impurities, will serve as the base material from which pennies will be minted in 1944, the zinc-coated steel penny inaugurated in 1943 having failed to catch popular fancy.

The Copper Recovery Corp. (see 1943 Year Book) was dissolved in December, its work having

been completed.

Unique from a technical standpoint was the use of a steel mill owned by Weirton Steel Co., Weirton, Pa., to roll brass strip and a steel mill owned by Acme Steel Co., Chicago, to roll gilding metal (97 per cent copper, 3 per cent zinc) strip. See BERYLLIUM; WAR PRODUCTION BOARD under

Balanced Production.

CHARLES T. POST.

COPYRIGHT. Registrations for the fiscal year 1942-43, according to the report of the U.S. Register of Copyrights, numbered 160,789, as compared with 182,232 for the preceding year. Of these 40,457 were classed as books, but included pamphlets, leaflets, and contributions in periodicals. Those printed in the United States numbered 39,784, those printed abroad in a foreign language, 156, while the remainder, 517, were English books registered for ad interim copyright. The chief classes of the remaining registration were: Periodicals (numbers), 42,995; musical compositions, 48,348; dramatic or dramatico-musical compositions, 3,681; works of art, models, or designs, 1,649; drawings or plastic works of a scientific or technical character, 1,911; photographs, 1,042; prints and pictorial illustrations, 2,317; maps, 737; lectures, sermons, addresses, 629; motion pictures not photoplays, 1,074; motion-picture photoplays, 693; reproductions of works of art, 221. The renewals numbered 9,650 as compared with 11,488 in the preceding year. The fees applied during the year amounted to \$306,836. The total number of separate articles deposited during the fiscal year ended June 30, 1943, was 252,123. The gross receipts of the Register's office for the fiscal year were \$324,300, the total expenditures for salaries, \$282,462, supplies, \$2,549. See Patent Office, U.S. , and for

CORN. Corn production in the United States in 1943 was estimated by the U.S. Department of Agriculture at 3,076,159,000 bu., the second largest yield on record, and compared with the 1942 record crop of 3,131,518,000 bu. and the 1932–41 average of 2,349,267,000 bu. The total acreage harvested, largest since 1937, was placed at 94,790,000 acres compared with 89,021,000 acres in 1942 and the annual average of 94,511,000 for the 1942 and the annual average of 94,511,000 for the 10 years 1932-41.

The average yield per harvested acre of 32.5 bu. of grain was exceeded in the 77 years of record only by the 1942 acre yield of 35.2 bu, and compared with the 10-year average of 24.9 bu. Hybrid seed, an important factor in raising the average yield per acre during recent years, was planted in more than half of the corn acreage. Most of the Corn Belt States planted better than 90 per cent of their acreage with hybrid corn, while the planting of hybrid in surrounding States and in other parts of the northern half of the country showed

substantial gain.

The corn harvested for grain was estimated at 2,759,080,000 bu., the 4,370,000 acres harvested for silage produced 35,028,000 tons of silage, and

the remainder of the crop, about 6,286,000 acres, was harvested for forage or grazed by livestock. The season average price per bushel (preliminary) received by farmers was \$1.122 in 1943 and the

value of production was estimated at \$3,451,337,-000 versus 91.7¢ and \$2,871,400,000 in 1942. The accompanying table lists the leading States in the production of corn for 1943. See CHEMISTRY under Alcohols and Proteins; INSECT PESTS.

CORPORATION INCOME, REORGANIZATION, TAXATION. See Business Review; Taxation.

CORSICA. A French island department in the Mediterranean, 100 miles southeast of Nice. Area, 3,367 square miles. Population (1936), 322,854. Chief towns: Ajaccio (capital) 38,000 inhabitants; Bastia, 52,208.

History. The French authorities in Corsica adhered to Marshal Pétain's Vichy regime following his capitulation to Germany in 1940. Four days after the Anglo-American landings in French North Africa on Nov. 8, 1942, Italian and German troops landed and occupied the island. Soon afterward anti-Axis patriots secretly commenced the organization of a national front of resistance, which received arms from the French High Command in North Africa. When the Italian Government surrendered to the Allies on Sept. 9, 1943, the patriot army seized control of Ajaccio and many other centers and ousted the Vichy authorities in favor of a prefectural council. This council was succeeded on September 14 by a prefect and a military commander appointed by the French Committee of National Liberation in Algiers.

The Italian garrison of some 70,000 men made little or no effort to interfere with these develop-

little or no effort to interfere with these developments. However there were in Corsica at the time of the uprising about 10,000 German troops—3,000 in the permanent garrison and 7,000 retiring across Corsica from Sardinia to the Italian mainland. The German troops sought to crush the revolt and recapture the capital. However they were defeated and driven from the island in a short campaign (September 9-October 1) by the French patriot army aided by French and American troops landed from North Africa. Corsica was then converted into a base of operations for Allied forces.

See World War.

COSMETICS. See FASHION EVENTS.

COSTA RICA. A Central American republic. Capital,

Area and Population. Area, 23,000 square miles; estimated population, 687,354 in 1942. The people are largely of Spanish and other European descent, except for some 18,000 Negroes in the Atlantic

banana zone and about 3,500 aboriginal Indians. Estimated populations of the chief towns as of Jan. 1, 1941: San José, 76,178; Cartago, 21,709; Limón, 17,065; Alajuela, 12,541; Heredia, 10,897; Puntarenas, 8,920. Living births in 1941, 28,823;

deaths, 11,429.

Defense. As of Jan. 1, 1941, Costa Rica had an active army of 548 men (220 musicians) and trained reserves of 200. A decree of July 6, 1940, established the National Police Corps, with both police and military duties. By an agreement signed July 14, 1941, Costa Rica engaged a U.S. military mission to supervise the training of the republic's small but expanding army. Under a lend-lease agreement signed Jan. 16, 1942, the U.S. Government undertook to supply arms and equipment to the estimated value of \$550,000. A squadron of U.S. army patrol planes was stationed at La Sabana airport near San José. The Costa Rican Government had one customs patrol launch in the Pacific and another in the Atlantic.

Education and Religion. The illiteracy rate is among the lowest in Latin America. On May 1, 1942, there were 697 schools of all kinds, with 73,320 pupils. There were 2 secondary schools, with 1,464 students; a normal school, with 550 students; and 2 colleges (at Alajuela and Cartago). The National University at San José was reopened in 1941. Roman Catholicism is the state religion, but the Constitution guarantees complete religious liberty.

Production. Agriculture is the chief occupation, Production. Agriculture is the chief occupation, with coffee, bananas, and cocoa accounting for nearly 90 per cent of all exports in 1941. The 1941–42 coffee crop was 24,618,912 kilos (of 2.2 lb.) and exports 344,535 bags (of 60 kilos). Banana exports in 1942 were 2,209,236 stems (4,922,924 in 1941); cocoa, 5,523,078 kilos in 1942 (5,683,434 in 1941). Corn, beans, rice, tobacco, sugar, potatoes, fruits, and other vegetables are grown mainly for home consumption. The 1940 are grown mainly for home consumption. The 1940 census showed 331,142 head of cattle. Gold and silver mining is important on the Pacific slope. The forests yield cedar, balsa wood, and hardwoods. There was a marked expansion of balsa production for war purposes in 1942 and 1943. Manufacturing is confined to cigars, cigarettes, furniture, candles, cheese, and a few other products.

Foreign Trade. Including bullion and specie, merchandise imports in 1942 totaled about 68,928,000 colones (99,800,983 in 1941); exports, 68,928,000 colones (56,398,772 in 1941). The United States supplied 81 per cent of all 1941 imports and took 81 per cent of all exports.

Finance. According to the President's message of

May 1, 1942, actual revenue receipts in 1941 were 42,602,500 colones and expenditures 47,393,500 colones. In 1942 receipts and expenditures were 36,918,078 and 48,513,205 colones respectively.

Public debt on Dec. 31, 1941: 149,195,010 colones (foreign, 105,175,023; internal, 44,019,-987). The colon remained pegged to the U.S. dollar at 1 colon equals \$0.1779 (official rate)

during 1941, 1942, and 1943.

Transportation. In 1942 Costa Rica had 413 miles of railway line, 448 miles of improved highways, and a domestic air network connecting with the Pan American Airways system. The chief ports are Limón on the Caribbean and Puntarenas on the Pacific. On Jan. 16, 1942, the U.S. Export-Import Bank agreed to contribute \$5,000,000 and the Costa Rican Government \$2,500,000 for completion of the Costa Rican section of the Pan American Highway. The following July he U.S. Government decided to construct at its own expense a pioneer military highway along the same route. Work on

both projects was pressed forward in 1942 and 1943.

Government. Executive power is vested in a president elected by direct vote for four years and legislative power in a Congress of 44 members, half of whom are elected (for four years) every two years. President in 1948, Dr. Rafael Angel Calderón Guardia, who assumed office May 8, 1940. Costa Rica declared a state of war with Japan on Dec. 8, 1941, and with Germany and Italy Dec. 11, 1941.

#### HISTORY

U.S. Relations. The close political, economic, and military collaboration between Costa Rica and the United States established during previous years was extended during 1943. Vice President Henry Wallace received an enthusiastic welcome when he visited Costa Rica on March 18-21 during his Latin American tour. On March 19 he inaugurated the first field office of the Inter-American Institute of Agricultural Sciences at Turrialba, near San José, a site selected by the Governing Board of the Pan American Union in 1942 (see 1948 Year Book, p. 525). Wallace, who first espoused the establishment of the Institute while U.S. Secretary of Agriculture in 1935, said that the Turrialba station's research on tropical agriculture, combined with the coordinating activities of the Institute, could change the course of life in the Western

Hemisphere within one generation. In April a mission of U.S. quinine and forestry specialists was appointed to work with Costa Rican authorities in selecting sites for cinchona planta-tions. The Costa Rican Government agreed to set aside up to 10,000 acres for planting with cin-chona seeds brought from the Philippine Islands. Steady progress was made in the development of the U.S.-Costa Rican agreement of 1941 for the establishment of a self-sustaining rubber-culture industry in Costa Rica. An exchange of notes on Apr. 3, 1943, expanded and clarified the original agreement. Shipments of wild rubber from Costa Rica by the U.S. Rubber Development Corp. in March increased to 85,005 lb. The highway-construction and food-production programs launched in 1942 with U.S. financial and technical aid likewise were carried forward (see 1943 YEAR BOOK, p. 180, for these agreements). They helped to sustain full employment and relative prosperity. In line with the increased contacts between the two republics, the U.S. and Costa Rican Governments in May elevated their legations in San José and Washington to the rank of embassies.

Axis Properties Sold. There was little trouble with pro-Axis elements in Costa Rica in 1943 as a result of the measures taken against them the pre-vious year. In February, 1943, the Government announced its decision to sell at auction the agricultural machinery of Japanese arrested at the outbreak of war and subsequently interned in the United States. Valuable German-owned plantations were subsequently auctioned off under the law authorizing expropriation of property held by Axis

nationals.

Political Developments. With a Presidential election due early in 1944, political interest centered on the selection of candidates by the rival political parties. Former President Leon Cortés Castro, a strong critic of President Calderón Guardia's National Republican administration, early entered the race. The National Republicans selected as their candidate Teodoro Picado, President of Congress, who was named first designate for the Presidency July 16 upon the death of the incumbent, Dr. Rafael Calderón Muñoz.

In September the new Popular Vanguard party made a compact with the National Republicans to support Picado's candidacy and the social legislation of President Calderón Guardia, to aid the democracies in the war, and to fight totalitarianism in Costa Rica. In June Archbishop Victor Sanabria, head of the Roman Catholic hierarchy in Costa Rica, authorized Catholic workers to affiliate with the Popular Vanguard, which included former members of the Communist party, liberals, and other groups. The Archbishop forbade Catholics to join Nazi or Fascist organizations.

At the request of President Calderón Guardia, a constitutional amendment providing basic guarantees for workers was approved by Congress. On August 20, Congress also passed a social security law submitted by the President, providing for free medical services, old-age pensions, etc. The law went into effect September 15, despite vigorous opposition from conservative business interests. A decree of August 10 authorized a bond issue of 400,000 colones for the establishment of a national fishing industry. The same decree authorized various measures for the encouragement of the stock-raising industry, including the establishment of an agricultural and livestock experimental station.

Legislation to protect and encourage production of basic foods was enacted November 6. On December 28 Congress passed a bill abolishing all restrictions against Chinese immigration. Costa Rica was thus the first Latin American republic to repeal Chinese exclusion laws.

Friction with Guatemala. Costa Rica's action in enacting basic labor guarantees and an advanced social security law aroused bitter criticism in the dictator-controlled press of neighboring Guatemala. Both the President of Costa Rica and Archbishop Sanabria were denounced as "Communists" for supporting this legislation. Archbishop Sanabria on December 24 announced that the Guatemalan Minister to Costa Rica had refused to issue a visa permitting him to attend a Eucharistic Congress in Guatemala as the Costa Rican delegate.

COST OF LIVING. See LIVING COSTS. For Cost-of-Living Bonuses, see LABOR CONDITIONS under Wages.

cotton. The 1943 cotton crop of the United States was estimated at 11,478,000 bales of 500 lb. gross weight as of Dec. 1, 1943. This compares with 12,817,000 bales in 1942 and a 10-year (1932-41) average of 12,474,000 bales. The indicated quality of the 1943 crop will average higher in grade but shorter in staple than in the two preceding years. The grade index of the 1943 crop probably will be higher than the record low indexes for the 1942 and 1941 crops but it will be lower than average. On the other hand the staple length of the current crop is expected to average shorter than that for any other year since 1939 and longer than any crop on record prior to 1938. Cotton farmers received the highest prices in many years for the 1943 crop but total returns from marketings may be slightly smaller than the \$1,426,000,000 returns from lint and seed in the previous season. Returns for the 1942 season were the highest since 1929.

The acreage of cotton in cultivation on July 1, 1943, totaled 22,151,000 acres. The production goal for 1944 is 22,277,000 acres. These figures compare with the 1942 acreage of 23,302,000 acres

and the 10-year average of 29,508,000 acres. Harvested acreage in 1943 totaled 21,874,000 acres against 22,602,000 in the previous season and a 10-year average of 27,718,000 acres.

Growing conditions in 1943 were unusually favorable at the beginning of the season with better than average stands and with weather sufficiently dry and hot to reduce the threat of heavy weevil damage. Continued drought and excessive heat throughout August and early September, however, resulted in considerable deterioration of the crop especially in Tennessee, Arkansas, Oklahoma, and Texas. The average yield per acre in 1943 was approximately 252 lb. against 272 in 1942 and the 10-year average of 217.

Table 1 shows the production of cotton in 500-pound gross weight bales for 1943 (estimate as of Dec. 1, 1943), 1942, and the average for the 10 years 1932–41.

<sup>1</sup> Included in State and United States totals. <sup>2</sup> Short-time average.

Some of the outstanding features of the quality of upland cotton from the 1943 crop as compared with the two preceding crops were (1) a substantial increase in the proportion of Strict Middling and higher grade cotton; (2) a decrease in the proportion of grades below Strict Low Middling; (3) a sharp increase in the production of <sup>19</sup>/<sub>16</sub>" and shorter staple; (4) a substantial decrease in the proportion of staples 1½6" and longer.

Cottonseed production in 1943 is estimated at

Cottonseed production in 1943 is estimated at 5,116,000 tons against 5,717,000 tons in 1942 and a 10-year (1932-41) average of 5,549,000. Of the 1943 production of cottonseed approximately 4,000,000 tons probably will be crushed by cottonseed oil mills and the remainder will be retained on farms for planting, livestock feed, etc. This compares with 4,498,000 tons crushed in 1942 and the 10-year average of 4,400,000 tons crushed. The production of cottonseed products from the 1943 crop is expected to approximate 1,200,000,000 lb. of cottonseed oil, 1,860,000 tons of cottonseed meal and cake, 940,000 tons of hulls, and 1,200,000 bales of linters. These products of cottonseed have assumed new importance because of the great need for additional vegetable oils, and high protein livestock feed. The demand for cottonseed oil for use in shortening compounds, oleomargarine,

etc., and for cottonseed meal and cake for livestock feed greatly exceeds supplies. Cotton linters is an important source of chemical cellulose for the production of gunpowder, rayon, photographic films, etc. Cottonseed hulls are used for livestock feed and as raw material for the production of

strategic chemicals.

The carry-over of cotton in the United States on Aug. 1, 1943, totaled 10,656,952 bales or slightly more than the previous season, but 2,375,-561 bales smaller than the record high carry-over of 13,032,513 bales on Aug. 1, 1939. The quality of the 1943 carry-over of upland cotton was one of the lowest on record with a grade index of 93.0 and an average staple length of 30.9 thirty-seconds

The 1943-44 supply of Strict Middling and higher grade cotton will be about 25 per cent more than last season; Middling 13 per cent less; Strict Low Middling 4 per cent less; and Low Middling and lower 5 per cent less. These grades include White and Extra White and approximately equivalent grades of colored cotton. The substantial increase in the 1943 production of Strict Middling and higher grade cotton will help to replenish stocks of these qualities which were reduced to an unusually low level at the beginning of the 1943 season.

The 1943-44 supply of 29/32" and shorter cotton is about 4 per cent more than last season;  $1\frac{1}{16}$ ° through 1" about 4 per cent less;  $1\frac{1}{32}$ " through  $1\frac{3}{2}$ ", 13 per cent less; and  $1\frac{1}{32}$ " and longer 10

per cent less.

The domestic consumption of cotton in the United States during the 1943-44 season will probably total about 10,300,000 bales or 900,000 bales less than indicated production in terms of running bales. Domestic consumption for 1943-44 is expected to be smaller than the record consumption of over 11,000,000 bales in the two preceding years mainly because of difficulties in maintaining an adequate force of experienced employees in cotton mills. There is an adequate supply of cotton for the maintenance of production at last season's high level and apparently sufficient manufacturing equipment. There is also a civilian and military demand sufficient to absorb the output of textile mills at an annual rate of at least the 11,-000,000 bales during the 1943-44 season although military demands will probably total somewhat less than the previous season. On some types of goods mills contend that cloth prices are not adequate to cover manufacturing costs although the levels of cotton prices during the first few months of the 1943 season were slightly below those in the previous season.

Mill margins for 17 constructions of coarse and medium cloths averaged 20.68 cents during the 5 months August through December, 1943, against 20.63 cents during the 1942-43 season and a 5-year (1937-41) average of 14.43 cents. These margins indicate in a general way the relationship between cotton and cloth prices and it is claimed that much of the increase in the level of margins during recent years has been absorbed by increased wages and other manufacturing costs.

Action was taken to stabilize cotton prices on Apr. 24, 1943, by sales of Commodity Credit Corporation stocks at a price of 21.75 cents for Middling 15/16" in "Group B mill point" areas with specified differentials for other locations and for other grades and staples. This price has been changed from time to time in line with legislation prohibiting sales of cotton at prices lower than parity. Through January, 1944, however, cotton

prices averaged well below the level of the Commodity Credit Corporation sales prices. Commodity Credit Corporation is required by law to make loans to farmers on cotton at 90 per cent of July parity. The parity price of cotton, which is computed by multiplying the average price of cotton in the 1909–14 period (12.4 cents per pound) by the index of prices paid by farmers, including interest and taxes, was 20.46 cents per pound on July 15, 1943, and 20.96 cents on Dec. 15, 1943. Farm prices of cotton averaged a little less than parity during the first half of the 1943-44 season. Foreign cotton (commercial) production has de-

creased considerably in recent years. Production is estimated at 13,850,000 bales for 1942—the lowest since 1934. This compares with 15,573,000 bales in 1941 and a record high of 18,854,000 in 1936. Complete data are not available for 1943 but indications are that production will be smaller in Egypt and a good many other countries than in 1942. The 1943 Indian cotton acreage is smaller than in 1942 but higher yields are expected to result in about the same production in 1943 as in 1942. Production, however, may be larger in Brazil, Argentina, Mexico, Uganda, and a few other countries. Stocks of foreign cotton on Aug. 1, 1943, were estimated at about 12,500,000 bales—the largest carry-over on record. The carry-over on 1945. Aug. 1, 1942, was estimated at 11,400,000 bales and on Aug. 1, 1939, at 7,501,000. See JAPAN under *History*; Textiles.

CARL H. ROBINSON.

COURT GAMES. Indoor court games were confined almost entirely to charity exhibitions in the 1942-43 season. With most of the players in the service, competition in racquets was nil, and the only court tennis event of note was a match held in New York for the Red Cross in which Pierre Etchebaster of New York, world champion, singly defeated the amateur doubles team of W. A. W. Stewart, Jr., and Charles Devens, 8–2, 8–4, despite a heavy handicap allowed his rivals. Joe Lordi of the New York A.C., former U.S. titleholder, won the Red Cross tourney held by the National Squash Tennis Association at the Yale Club in New York.

Competition in squash racquets was a bit livelier, with H. Sherman Howes of Boston triumphing in the national invitation tourney held on the University Club courts in New York, while the veterans final went to A. H. Sonnabend of Boston. Members of the American and Canadian armed forces met or the American and Canadian affiled forces met in a team match, with the former winning, 7–2. John C. Holt of Yale won the intercollegiate title and Canada took the Lapham Trophy by defeating a U.S. team at Montreal. H. W. Pell of the Prince-ton Club annexed the New York State honors. THOMAS V. HANEY.

CRITICAL MATERIALS AND COMPONENTS. See WAR Production Board; also under Strategic. For Critical Occupations, see WAR MANPOWER COMMIS-

CROATIA. See YUGOSLAVIA.

CROMWELL DIVORCE CASE. See Law.

CROP PRODUCTION. See AGRICULTURE; articles on leading crops; countries under *Production*.

CROSS-COUNTRY RUNNING. If one man could be picked as the star of cross-country running for last season the honor probably would have to go to the veteran Dartmouth harrier, Don Burnham. Don, a consistent scorer all year, won the Intercollegiate A.A.A.A. title to pace his team to victory and helped the Hanoverians win the Heptagonal Association crown, although in that race he did finish second to Arthur Truxes, West Point yearling.

The National A.A.U. senior laurels were won by Bill Hulse of the New York A.C., the team title being won by the Naval Academy. Clayton Farrar of the Millrose A.A. took the Metropolitan A.A.U. senior crown to help his club capture the team

championship in that competition.

Sergeant Gerard Cote of the Canadian Army scored a marathon double. Cote, who won both the Boston and Yonkers races in 1940, duplicated that feat by winning the National A.A.U. marathon held at Yonkers following his great victory in the Boston run last spring.

THOMAS V. HANEY.

CRYMO-THERAPY or CRYMO ANESTHESIA. See MEDI-

CUBA. An island republic in the West Indies. Cap-

ital, Havana (Habana).

Area and Population. Area, 44,164 square miles; population at the census of 1943, 4,777,284. About one-half of the inhabitants may be classified as whites, one-fourth as mulattoes, and one-fourth as Negroes. The 1931 census showed 613,970 Spaniards. As of Jan. 1, 1941, there were 5,531 U.S. citizens residing in Cuba. Estimated populations of the chief cities: Havana, 728,197 (with suburbs); Camagüey, 187,893; Santiago de Cuba, 106,860; Santa Clara, 99,363; Matanzas, 72,481. Incomplete registration statistics showed 78,310 living births and 43,168 deaths in 1941.

Defense. By the decree of Mar. 10, 1942, able-bodied men between 20 and 50 years of age were obliged to register for compulsory military training for a basic period of one year (see 1943 Year Book, p. 184). Enlistment of Cubans and foreigners between 20 and 35 years of age for voluntary service overseas began Nov. 16, 1942. This program resulted during 1942 and 1943 in a considerable expansion of the defense establishment existing prior to Cuba's entrance into the war (see History below).

In a lend-lease agreement signed in November, 1941, the U.S. Government undertook to supply Cuba with military, naval, and air equipment to the value of \$7,000,000. A pact for Cuban-American military and naval cooperation in the war with the Axis was signed Sept. 7, 1942. With the agreement of the Cuban Government, the United States constructed air bases near Havana and at San

Julian near the western tip of the island, and established a great military-civilian supply depot at Santiago de Cuba. For the defense establishment on Jan. 1, 1941, see 1943 Year Book.

Education and Religion. About 39 per cent of the adult population was illiterate at the 1931 census. School statistics for 1939-40 showed 445,706 pupils attending 8,796 public class-rooms; 35,290 pupils in 473 private schools; 3,089 pupils taught by 67 traveling teachers; and 8,972 pupils in night schools for workers. The University of Havana has about 6,000 students. Roman Catholicism is professed by the great majority of the population but there is no state church.

Production. Cuba is primarily an agricultural country, with sugar and tobacco as the chief crops. The 1943 sugar crop was fixed by Government decree at 3,225,000 short tons, compared with the 1942 crop of 4,016,000 short tons (including that part produced as invert molasses). Raw sugar production was 3,804,000 short tons in 1942 and 2,843,080 long tons (of 2,240 lb.) in 1943.

The other leading crops are tobacco (42,534,000 lb. in 1941), coffee (59,256,368 Spanish lb. in 1941-42), bananas (2,245,000 stems in 1942), other fruits and vegetables, cocoa beans, rice, and henequen (exports, 23,687,000 lb. in 1941). The estimated livestock population in 1940 was: 391,-000 horses, 33,000 mules, 5,335,000 cattle, 857,000 swine, and 141,000 sheep. In 1941 livestock slaughtered commercially included 510,559 cattle, 209,680 swine, and 33,551 sheep and goats.

Mineral production in 1940 was valued at an estimated \$11,700,000. Exports of mineral ores in 1941 were valued as follows: Manganese, \$6,510,-131; copper, \$1,329,346; iron, \$209,924. Chromium, barite, silica, and gold are exported and salt and some petroleum are mined for local consumption. Using both domestic and imported materials, industrial production has expanded rapidly in recent years. The value of manufactures in 1939 was 63,970,624 pesos (excluding products of sugar mills and similar commodities); workers employed numbered 32,101 and raw materials used were valued at 22,234,300 pesos. Tourists entering Havana in 1941 numbered 126,090 and their expenditures were estimated at 14,294,000 pesos.

Foreign Trade. Including bullion, general imports in 1942 amounted to \$146,760,000 (\$133,920,000) in 1941), while general exports were \$182,400,000 (\$211,560,000 in 1941). The figures are in U.S. currency. In 1941 the United States supplied 87.6 per cent of Cuba's imports and took 85.7 per cent of the exports. See 1943 Year Book for details of

Finance. Actual regular budget receipts in 1942 were 95,724,000 pesos and expenditures 104,810,000 pesos (1 peso = 1 U.S. dollar). However the transfer to the regular budget of the proceeds of certain emergency taxes imposed in 1941 converted the deficit into a surplus of 1,186,000 pesos—the first since 1936—37. Expenditures for 1943 were estimated at 97,000,000 pesos (23,000,000 for definance) fense). The funded public debt on Dec. 31, 1942, was \$118,416,000 (foreign, \$111,099,000; internal, \$7,317,000); the total on Dec. 31, 1941, was \$123,-560,000. The floating debt was estimated at more than 50,000,000 pesos at the end of 1942. In 1941 Congress authorized the Government to obtain a \$25,000,000 credit from the U.S. Export-Import Bank, but none of this had been received up to Dec. 31, 1942.

Transportation. Cuba in 1943 had 6,873 miles of railway lines of all kinds; of these 3,081 miles were lines of common-carrier routes, while the remainder represented private sugar railways, sidings, etc. Improved roads and highways totaled 2,390 miles. There were air connections with the United States and all the countries of the Western Hemisphere. Air traffic in 1941 was: Planes operating, 3,626; passengers, 65,168; mail carried, 119,227 lb. In 1941 a total of 1,598 vessels entered the port of Havana in the overseas trade (1,666 in 1940).

Government. The Constitution promulgated Oct. 10, 1940 (see Year Book for 1940, p. 171), vested executive power in a President elected for four years. Legislative power rests in a Senate of 54 members (nine from each province) elected for six years, with one-third replaced every two years. and in a House of Representatives containing one member for each 35,000 inhabitants, with one-half the members elected every two years for four-year terms. (Under a temporary arrangement, one-half of the previous Senate and House retained office along with the new Senators and Representatives elected in 1940. Both Chambers were reduced to the constitutional level by progressive steps, ter-minating in 1944.) The President appoints a Premier, who retains office only so long as he enjoys the support of a majority of the House of Representatives. The President, members of Congress, and provincial and municipal officials are elected by compulsory direct popular male and female suffrage. President in 1943, Col. Fulgencio Batista, who assumed the Presidency Oct. 10, 1940, followwho assumed the Freshency Oct. 10, 1940, 1010Wing his election on July 14, 1940. As a result of the elections of Mar. 15, 1942, the Government coalition at the beginning of 1943 held 35 of the 54 seats in the Senate and 98 of the 138 seats in the House. The Cabinet formed Aug. 16, 1942, was headed by Senator Ramón Zaydín (Liberal).

The Cuban Government declared war on Japan Dec. 9, 1941, and on Germany and Italy Dec. 11, 1941. For developments in 1943, see below.

#### HISTORY

Cuban-American Relations. The close military, political, and economic collaboration established between Cuba and the United States during 1942 (see 1943 YEAR BOOK) was continued and extended during 1943. With the aid of lend-lease shipments of arms and equipment from the mainland, marked progress was made in training Cuban ground, air, and sea forces for both home defense and overseas service. The large United States air base near Havana was completed early in 1948 and named Batista Field. On February 1, a new agreement for military and naval cooperation between the United States and Cuba was signed in Havana. It supplemented the similar accords signed June 19 and Sept. 7, 1942. Provisions of the three accords were not made public. Another agreement signed February 11 applied reciprocal selective service to Cuban nationals in the United States and to United States citizens in Cuba. In March the U.S. Government turned over to Cuba under lend-lease 12 anti-submarine patrol boats. The Cuban crews had been trained in the Navy's subchaser school at Miami. The first sinking of a U-boat by one of these sub-chasers was announced by the Cuban Navy three months later.

Meanwhile the program for expansion of the Cuban Army adopted in 1942 was carried forward. On January 22 President Batista recalled to active service 48 former Cuban Army officers, who either resigned or were dropped from the service after opposing the so-called "sergeant's revolt" of 1933 through which Batista began his rise to power. The first drawing of draftees under the 1942 military service law began on April 25 and inductions

for the required four months of military training began in June. Plans called for the induction of 8,000 men every four months, beginning with men between 20 and 25 years of age. Registration of the classes between 25 and 35 and between 35 and 50 took place during separate periods of 1943.

Under the law, draftees could not be sent outside of the island except by special act of Congress. However the regular army was expanded and trained with the Emergency Volunteer Corps for overseas service. President Batista repeatedly expressed the desire of the Cuban people for an active part in the struggle with the Axis. Many army, navy, and aviation officers were sent to the

United States for specialized instruction.

On July 23 the Cabinet declared all ports, mines, public services, main highways, radio stations, military bases, sugar mills, and other industries supplying war materials to be war zones and thus subject to martial law. The Government in February warned labor that it would permit no strikes or disturbances during the sugar harvesting season because the crop was vital to the island's economy. A decree of August 24 declared manganese, copper, and chromium to be essential war minerals, the output of which might not be interfered with for any reason. These minerals were of vital importance to United States war industries.

That these tangible measures in support of the American war effort reflected the sentiment of the Cuban people was demonstrated on July 4, when Cuba celebrated the United States national holiday with a huge parade in Havana, organized by the veterans of the Cuban war of independence. The Cuban Government also continued its vigorous drive against Axis sabotage and espionage, winning the commendation of the Emergency Advisory Committee for the Political Defense of the Hemi-

sphere, which met in Havana in August.

Sugar Agreements. Cuba received substantial economic and financial aid from Washington in return for its collaboration. On April 3 the U.S. Commodity Credit Corporation contracted with the Cuban Sugar Stabilization Institute to buy 2,700,000 tons of the 1943 sugar crop at 2.65 cents per lb., f.o.b. Cuban ports. The contract caused dissatisfaction in Cuba, as the total sum involved amounted to about \$160,000,000 as against the \$251,000,000 paid in 1942 for some 4,000,000 tons of raw sugar. The U.S. Government had been unable to move much of the sugar contracted for in 1942 because of the shipping shortage. However improvement in the shipping situation in 1943, and the increased need for Cuban sugar by the mainland and the United Nations, led to the early conclusion on August 21 of a new contract covering the 1944 crop. This time the Commodity Credit Corporation agreed to take 4,000,000 short tons at 2.65 cents a lb., the same price paid in 1942 and 1943. The 1944 sugar check would thus total \$212,000,000, a 33 per cent increase over 1943.

\$212,000,000, a 33 per cent increase over 1943.

The Tinguaro mill of the Cuban-American Sugar
Co. was largely destroyed by fire, with a loss estimated at \$1,000,000, on January 20. Delay by the company in repairing the mill led the Cuban Government to take it over on October 5 and commence repairs to put the property in shape for

the spring grinding season.

Other U.S. Aid. It was revealed early in 1943 that the U.S. Defense Plant Corporation had advanced a credit of \$20,000,000 for the exploitation of Cuba's nickel deposits. The previously untouched \$25,000,000 credit advanced to Cuba by the Export-Import Bank in 1941 (see 1942 Year Book)

was utilized in part during 1943 for the development of a food production program designed to compensate in part for the smaller sugar crop. On the strength of a U.S. Government contract to purchase 40,000,000 lb. of dehydrated Cuban vegetables annually for two years, the program called for the construction of six refrigerated warehouses and a dehydration plant. Farm machinery was to be acquired to encourage diversification of agricultural production. The U.S. Treasury's agreement for the sale of gold to Cuba to stabilize the currency was extended for three years from June 30, 1943.

Other Foreign Relations. The Soviet Ambassador to the United States presented his credentials as Minister to Cuba to President Batista on April 9. In August, Cuba recognized the French Committee of National Liberation in Algiers. Members of the pro-United States Acera del Louvre Association in January announced a boycott of Argentine and Chilean products in a move to force those countries to break off relations with the Axis powers. In July the Cuban and Spanish Governments signed an agreement for unfreezing equal amounts of blocked Spanish and Cuban credits, permitting a resumption of the previously important commercial relations between the two countries

cial relations between the two countries.

Political Developments. With a Presidential election scheduled for June 1, 1944, the political campaign got under way during 1943 with the customary fervor. Leaving the field clear for other candidates, President Batista on January 22 reiterated his intention to retire from office at the expiration of his term. Late in May he obtained Congressional approval of the new electoral code under which the elections were to be conducted. But difficulties encountered in compiling the electoral census and dissensions within the government coalition threatened for some time to interfere with the balloting.

Friction between Batista and Minister of Education Ramón Vasconcelos, a leader of the Liberal party, led to the resignation of the Minister on January 6. A number of the other Ministers followed suit, inaugurating a Cabinet crisis that lasted for three months. Meanwhile a special session of Congress declined to approve emergency financial and economic legislation demanded by the President. The Cabinet crisis was finally resolved on March 6, when Batista appointed six new Ministers, of whom two were members of the opposition ABC party and one represented the Communists. While supporting Batista, the Communist party hitherto had not been represented on the Cabinet.

The new arrangement found all of the Cuban political parties supporting the Government except Dr. Ramón Grau San Martín's Authentic Revolutionary party. Grau San Martín, who unsuccessfully opposed Batista in 1940, indicated that he would again be the opposition candidate for President. The leading contender for nomination as the official Administration candidate was a National Democrat, Senator Carlos Saladrigas y Zayas, who served as Premier in 1942. Opposition to the Saladrigas candidacy led to a split in the National Democrats on May 13. Vice-President Gustavo Cuervo Rubio, supported by the Mayor of Havana, 2 Cabinet Ministers, 11 Senators, 7 Representatives, and 2 Provincial Governors, withdrew and formed the new Republican party. The new party went into the opposition and its two Cabinet Ministers resigned May 17. Guillermo Alonso Pujul, another supporter of Vice-President Cuervo, resigned as President of the Senate August 23. He was succeeded by Senator José Enrique Brin-

guier y Laredo, who was also a National Democrat.

Meanwhile the Cuban Communist party, boasting a Cabinet Minister, a newspaper, and a radio station, was reported growing rapidly, partly at the expense of Grau San Martín's Auténticos. Its effort to control Cuban labor through the Confederation of Cuban Workers received a setback early in September. The leaders of the maritime unions resigned from the Confederation in protest against the overwhelming Communist influence displayed at a meeting in Havana of the executive committee of the Confederation of Latin-American Workers.

The inability of the Government parties to agree upon a candidate led President Batista on August 20 to declare that he would turn over the Presidency to the oldest Justice of the Supreme Court, in accordance with the Constitution, if a successor was not elected before the expiration of his term. Preliminary returns on party registrations under the new electoral code, published on November 1, indicated an easy victory for the Government coalition in 1944 if it remained united. A total of 1,218,000 members registered from the five coalition parties, as against 419,000 in Grau San Martín's Auténticos. The new Republican party, with some 231,000 members, was expected to oppose the Administration candidate. About 300,000 voters failed to register in any party.

Economic Conditions and Measures. Economic conditions in Cuba remained difficult in many respects during 1943 as a result of the lower production and export of sugar; reduced exports of rum, to-bacco, fruits, and vegetables; the growing scarcity of imported goods and consequent rapid rise in prices; and the large budget deficit resulting from the action of Congress in raising government salaries and pensions in 1942 without providing for higher revenues.

In his message to the special session of Congress on January 27 Batista proposed increased taxes on incomes, profits, property, and capital along with levies on inactive bank accounts. His tax program, originally designed to raise an additional \$16,000,000 annually, was adopted in an altered and less drastic form after months of delay. Among the new taxes imposed was one levying 1.8 per cent annually on foreign investments of Cubans and foreigners doing business in Cuba. This aroused vigorous protests among American firms operating on the island. Cuban employers in mid-summer organized a Confederation of Producers and sought official recognition of its right to consult with the central, provincial, and municipal governments on measures affecting their interests.

Price control regulations introduced in 1942 encountered many difficulties. Refusal of cattle growers to sell livestock at the fixed price led the Government in March to take over and operate a number of slaughter-houses. Ceiling prices were fixed for previously uncontrolled food items from time to time. In July a Government decree established maximum rates for water, light, gas, power, and for land, sea and air freight rates, and passenger fares. Former President Carlos Hevia, chief of the Office of Price Control and Supply, resigned August 21 on the ground of insufficient authority to enforce his price control rulings.

enforce his price control rulings.

A Board of Economic Warfare was established. May 11 for the purpose of adapting Cuba's economy to the war emergency and preparing to meet postwar contingencies. Headed by the Premier, the Board had both advisory and executive powers. On September 2 the Board made recommendations to President Batista that ran counter to much of

Cuba's recent economic legislation. It suggested inducements to foreign and local capital to establish new industries, including the stabilizing of customs rates, tax levies, and labor conditions for five years. The \$12,000,000 Bacardi rum plant at Santiago was placed under the management of a Government agent October 6 when the company refused to comply with a Government order for wage increases that followed a sitdown strike in April. A marked improvement in economic conditions was noted toward the year's end, but the continued rise in living costs caused a continuing agitation for higher wages.

Other Events. A serious epidemic of typhoid and malaria broke out in many districts of Oriente, Santa Clara, and Havana provinces during July, apparently because of the relaxation of sanitary precautions. There were recurrent strikes of high school students against the introduction of a five-year course and the stiffening of requirements for

entrance into Havana University.

See Geological Survey; Pan Americanism; Spanish-American Literatures; World War.

CULTURAL RELATIONS, Division of. See STATE, U.S. DEPARTMENT OF.

CURAÇÃO. A Netherlands West Indian colony comprising two groups of islands 500 miles apart. One group just north of Venezuela includes Aruba (69 sq. mi.), Bonaire (95 sq. mi.), and Curaçao (210 sq. ini.), Bohane (95 sq. ini.), and Chiaçao (210 sq. ini.); the other group just east of the Virgin Islands includes Saba (5 sq. ini.), St. Eustatius (7 sq. ini.), and the southern part of St. Martin (17 sq. ini.). Total area, 403 square miles. Population (Jan. 1, 1942), 109,592. In 1941 there were 3,355 births and 1,042 deaths. Willemstad (capitally or the island of Chrane and 31,264 inhabitally or the island of Chrane and 31,264 inhabit tal), on the island of Curação, had 31,264 inhabitants.

Production and Trade. Refined oil (from imported crude oil), straw hats, phosphate of lime, and salt are the main products. Oil refining is the most important industry. Trade (1941), excluding petroleum: imports were valued at U.S.\$15,168,156; exports totaled U.S.\$1,420,046. Air services link Curação, Aruba, Jamaica, Trinidad, and North and South America. Shipping entered the ports (1941): 6,789 vessels totaling 24,678,119 register tons.

Government. Budget (1942): revenue 14,513,901 guilders; expenditure 14,199,041 guilders (the exchange value of the guilder was \$0.525 in February, 1943). Curação is administered by a Governor, assisted by a council of 4 members, and a States Council of 15 members (10 elected by the voters and 5 nominated by the governor). Governor, Dr. Pieter Kasteel (appointed May 21, 1942).

CUSTOMS, Bureau of. The almost complete concentration of the national economy of this country on war operations during the fourth year of the world war increased materially the problems and activities of the Customs Service during 1943. There was no respite from the numerous war-inspired activities, which had progressively multiplied during the three preceding years, but to these were added new responsibilities and functions resulting from the accelerated tempo of our productive and distributive operations. Since the normal as well as the previously delegated wartime activities of the Customs Service have received due consideration in past editions of the YEAR BOOK, the reader is referred to these former articles for a more complete description of customs functions and performances prior to the present year. This article is limited to those occurrences during 1943 which deserve special mention.

Wartime Activities. Among new problems of the Customs Service resulting directly from this year's prosecution of the war, the following are enumerated: the extension by Executive Order 9177 dated May 30, 1942, to the War Department, Treasury Department, Department of Agriculture, and Reconstruction Finance Corporation of the same privileges of the free entry of merchandise formerly enjoyed only by the Navy Department; the disposal of the salvaged property of torpedoed and wrecked vessels; the handling of imported materials taken into temporary custody and removed from docks or warehouses by the War Department in order that the movement of war supplies might not be impeded by any congestion of transportation facilities; the superintendence over imported merchandise which could not be removed from customs custody within the limited statutory period because of delays caused by export control, Foreign Funds Control, or other governmental emergency licensing requirements or by other wartime conditions; and the admission free of duty of such special categories of merchandise as the effects of persons evacuated to the United States by Government order, articles for members of the Armed Forces of the United Nations, gifts sent home by soldiers and sailors abroad, and articles for enemy prisoners of war.

Indirectly, as well as directly, the continuation of hostilities added to customs activities. Rationed articles, such as processed foods, coffee, sugar, shoes, and rubber products, were detained upon importation unless ration stamps were surrendered or a permit secured from the Office of Price Administration, and the lading of such articles for use as ships supplies on outgoing vessels was carefully limited and supervised. A number of waivers of compliance with certain provisions of the navigation laws, particularly to permit some foreignflag vessels to engage in coastwise and other types of trade from which they would ordinarily be excluded, were issued under the authority of the Second War Powers Act.

Customs Collections. For the second successive year total collections by the Customs Service declined. Of the total collected in 1943 (\$414,191,-247) \$328,123,797 represented actual customs receipts and \$86,067,450 collections for other governmental agencies. Of the total collected in 1942 (\$428,596,660) actual customs collections constituted \$390,059,109, while \$38,537,551 was for other agencies. By far the largest portion of collections for other agencies consisted of internal-revenue taxes on imported liquor and the large increase in such collections was due not so much to an increase in the quantity brought in as to an increase in the tax rates. The commodities included in twelve of the fifteen schedules of the tariff act yielded less revenue than in 1942, increased collections accruing only from imports of wool, liquors, and tobacco.

The gradual downward trend in customs receipts which prevailed throughout the fiscal year 1942 was greatly accelerated during the first three months of the fiscal year 1943, and in September,

1942, duties and miscellaneous customs collections aggregated only \$20,579,557, the smallest amount collected during any single month in more than seven years; in fact, not since July, 1935, had collections for any month fallen below 22 million dollars. During the five months beginning with October, 1942, collections averaged \$25,001,862 and exhibited a perceptible trend upward. Collections increased sharply in March and went slightly above the March level during the subsequent months, averaging \$34,104,856 for the last four months of the year.

Volume of Business. The downward trend in the number of entries of merchandise which began in 1939 continued during the present year. Under war conditions an increase in the quantity and value of the goods included in each individual entry by governmental or commercial importers has been concomitant with a decline in the number of such entries. Consequently there were fewer of each of the important types of entries than in the

previous year.

Contrary to the trend of duty collections and entries of merchandise, border traffic increased for the second successive year, declines in automobile and ferry traffic being more than offset by the greater use of other transportation media. The most important traffic trend appeared in the increased use of passenger trains by those wishing to cross the border. Airplane traffic on international lines continued its expansion for the twelfth consecutive year.

Enforcement of Customs Laws. For the second successive year more seizures were made than during the preceding year, every type of seizure except lottery seizures being more numerous than in 1942. The total value of goods seized by customs officers, however, was not as great as in 1942, due to the fact that during the earlier year vessels of much greater value were seized than during 1943. Although more liquor seizures were made than during the previous year, the quantity and value of distilled and malt liquors and alcohol were less than in 1942. Narcotic seizures increased both in number and value as compared with the previous year, but these seizures continued to be confined to quantities far smaller than in the heyday of narcotic smuggling. A considerable portion of the narcotic seizures was made along the Mexican border.

CUTBACKS. See BUSINESS REVIEW; CHEMICAL INDUSTRY; MACHINERY. For Cutback Strikes, see LABOR CONDITIONS under Strikes.
CYCLONES. See HURRICANES.

CYCLOTRON. See Physics under Hundred Million Volt X-Rays.

CYPRUS. A British island colony in the eastern Mediterranean, 40 miles distant from the Anatolian Peninsula and 60 miles from the Syrian coast. Area, 3,572 square miles; estimated population in 1940, 383,967. Living births in 1940 numbered 13,257; deaths, 4,678. Chief towns: Nicosia (capital), 24,695 inhabitants; Limasol, 15,757; Larnaca, 12,292; Famagusta and Varosha, 10,579. The majority of the inhabitants speak a Greek dialect and profess the Greek Orthodox faith. About one-fifth are Turkish-speaking Moslems. There are small Maronite and Armenian minorities. The educated classes speak English and French. Each religious group has its own schools, the primary schools being under government supervision.

der government supervision.

Production, Trade, etc. The chief products in 1940 were wheat 1,723,000 bu., barley 1,595,000 bu.,

olives 12,848 tons, carobs 39,700 tons, potatoes 29,-150 tons, raisins 5,375 tons, wines 3,835,000 gal., olive oil 450,000 gal., cupreous pyrites, asbestos, gypsum, terra umbra, and sponges. Livestock (1940): 43,700 cattle, 313,500 sheep, 169,000 goats, 59,400 donkeys, 14,000 horses and mules, 37,400 pigs. The overseas merchandise trade in 1940 was: Imports, £1,782,430; exports, £1,526,-423. Shipping entered and cleared in 1940 totaled 689,308 tons. Roads extended 2,581 miles in 1940.

Government. Estimated budget expenditures for 1942 were £1,418,833; revenue, £1,194,901. Public debt on Jan. 1, 1939: £822,300. Administration is in the hands of a Governor, assisted by an executive council. The legislative council was abolished as a result of disturbances in 1931 (see Year Book for 1931) and the Governor was granted power to legislate. An advisory council was established in 1933. Governor, Sir Charles Woolley (app. Sept. 20, 1941).

#### CYRENAICA. See LIBYA.

CZECHOSLOVAKIA. A former Central European republic (capital, Prague), partitioned among Germany, Poland, and Hungary in 1938 and 1939, with the exception of part of Slovakia which became a nominally independent republic under German protection, with its capital at Bratislava. The manner in which the Czechoslovak republic was partitioned was described in detail in the Year Books for 1938 and 1939 and is summarized in the accompanying table.

# PARTITION OF CZECHOSLOVAKIA

| Territory annexed                                       | Date of session or seizure    | Area<br>sq. mi. | Estimated pop. 1939  |

Gocupied by Germany in September, 1939; 225 square miles were trans erred to Slovakia on Oct. 21, 1939. Ruthenia is also referred to as Carpatho-Ukraine. Date of Slovak declaration of independence. Excluding areas transferred from Poland to Slovakia by Germany on Oct. 21, 1939. Within the frontiers fixed by the German-Slovak treaty of Nov. 31, 1939, Slovakia had an area of 14,706 square miles and a population on Dec. 15, 1940, of 2,654,000.

The Sudetenland was annexed as an integral part of the German Reich. Hungary similarly incorporated in its national territory the districts acquired from Czechoslovakia. Bohemia and Moravia were established as a protectorate within "the territory of the Great German Reich." See separate articles on Bohemia and Moravia and Slovakia. Government-in-Exile. The Government of Czecho-

Government-in-Exile. The Government of Czechoslovakia in London, which won full recognition from Great Britain, the United States, and the Soviet Union in 1941 (see 1942 YEAR BOOK for details), was constituted as follows at the beginning of 1943: President, Dr. Eduard Beneš; Premier, Mgr. Jan. Sramek; President of the State Council of 40 members, Prokop Maxa. The Cabinet included Jan Masaryk, Deputy Premier and Minister of Foreign Affairs; Gen. Sergej Ingr, National Defense; Dr. Juraj Slavik, Interior; Frantisek Nemec, Economic Reconstruction and Trade; Dr. Ladislav Feierabend, Finance; Dr. Jaroslav Stransky, Jus-

tice; Dr. Hubert Ripka and Gen. Rudolf Viest, Ministers of State; Jan Lichner, Agriculture and Public Works; Jan Becko, Social Welfare.

The Government signed military accords with Great Britain on Oct. 25, 1940, and with the Soviet Union on July 18, 1941, under which independent Czechoslovak military and air forces were organized in the British Isles and Russia. On Dec. 16, 1941, President Benes issued a decree declaring the Czechoslovak Republic in a state of war with all countries at war with Great Britain, the U.S.S.R., or the United States. For 1943 developments, see History.

## HISTORY

The Czechoslovak Government in exile in London grappled with three major problems during 1943. President Beneš and his associates sought (1) to safeguard the independence and security of a restored Czechoslovak Republic after Germany's defeat, (2) to establish and maintain political unity among the nationalities, classes, and political parties comprising the republic, and (3) to complete plans for postwar economic and social reconstruction.

Foreign Relations. The first of these problems involved primarily Czechoslovakia's relations with the U.S.S.R., Great Britain, the United States, and Poland. During previous years these powers and more than 20 other United Nations had recognized the Czechoslovak Government in exile and the pre-Munich boundaries of the republic (see 1943 YEAR BOOK). Early in 1943 the Soviet Government formally affirmed the assurances given President Benes by Foreign Commissar Molotov in May, 1942, that Moscow recognized Czechoslovakia's pre-Munich frontiers. This relieved fears that the Soviet Government would lay claim to the eastern or Carpatho-Russian (Ruthenian) districts of the

republic in the peace settlement.
On the other hand, the growing friction between Moscow and the Polish Government in exile that led to the severance of diplomatic relations on Apr. 26, 1943, aroused the gravest apprehensions in Czechoslovak governmental circles. Polish-Russian hostility threatened to disrupt the collaboration between Russia and the other United Nations which Dr. Beneš considered essential to postwar peace and stability in Europe and to the survival of Czechoslovakia as an independent state. Consequently Beneš declined to proceed with the program of Polish-Czechoslovak federation set forth in the agreements of Nov. 11, 1940, and Jan. 25, 1942 (see 1943 YEAR BOOK, p. 188), unless friendly relations were restored between Poland and Russia. Furthermore he insisted that no federation program was feasible among any of the small Central European states except with the prior approval of both the Soviet Union and Britain. Another obstacle to Czechoslovak-Polish federation was the continued failure of the Polish Government to agree to the restoration of Teschen and of other small frontier districts in Slovakia that were acquired by Poland by means of an ultimatum on Oct. 1, 1938 (see 1938 Year Book, p. 190).

Late in February it was announced that Beneš was planning an official visit to the United States and Russia. He arrived at the White House in Washington on May 12, a day after Prime Minister Churchill had taken up temporary residence there, and the three statesmen employed the opportunity for a discussion of Eastern European and Russian affairs. The Anglo-American governments had previously manifested approval of the proposed federation of the small Eastern and Central European

states. In this discussion and in a series of important addresses delivered before both houses of the U.S. Congress, the Canadian Parliament, and various semi-official and private meetings in New York and Chicago, Benes emphasized that the collabora-tion of both Russia and France was a prerequisite to the establishment of any effective system for maintaining the peace of Europe. Coincident with Benes's arrival in Washington, President Roosevelt sent to the Senate the nomination of Anthony J. Drexel Biddle to be Ambassador (instead of Minister) to the Czechoslovak Government in exile.

Following his return to London, Beneš on June 24 broadcast to Czechoslovakia a report on the results of his journey. Referring to the efforts of German propaganda to divide the U.S.S.R. and the United States, he said that he had participated in "official conversations between the United States and the Soviet Union as well as in considerable public discussions" which had made the prospect of "friendly undisturbed collaboration between the United States and Soviet Union during and after this war . . . absolutely certain and firm.

One of the issues taken up by Beneš in Washington was his proposal for a mutual assistance pact with the Soviet Union. While the United States apparently raised no objection, the British and Polish Governments early in June reportedly urged him to postpone his visit to Moscow and the signing of the treaty pending a further British effort to restore friendly Polish-Russian relations. Impatience at the delay was expressed by the Czechoslovak Government on October 2 when it openly announced its desire for a mutual assistance pact with Russia. The Soviet Government indirectly took the same stand a week later. The issue was one of many brought up for consideration at the meeting of the British, American, and Russian Foreign Ministers in Moscow late in October.

At that conference the Russian Foreign Commissar was reported to have insisted on immediate conclusion of the treaty. While considering the move ill-timed and calculated to discourage progress toward a new world order, the British and U.S. Governments raised no further objection. Dr. Beneš then journeyed to Moscow and on December 12 a 20-year mutual assistance pact was signed.

In it the two parties agreed to unite in a policy of permanent friendship and friendly postwar collaboration, as well as mutual assistance of all kinds in the war against Germany and her allies (Art. I). They bound themselves "not to enter any sort of negotiations with the Hitlerite Government or any other Government of Germany which does not explicitly renounce all aggressive intentions" and not to discuss "any sort of treaty of peace" with Germany and her allies except by mutual agreement (Art. II). They reaffirmed the Soviet-Czechoslovak mutual assistance pact of May 16, 1935, and agreed to provide each other military and other support if either became "involved in hostilities with Germany, renewing her policy of Drang nach Osten, or with any other state united with Germany in such a war (Art. III). Both parties agreed to collaborate on the basis of "mutual respect of their independence and sovereignty as well as noninterference in the internal affairs of the other State" and to render each other all possible postwar economic assistance (Art. IV). Each also undertook "not to conclude any alliance and not to take part in any coalition directed against the other" (Art. V).

A protocol attached to the treaty provided "that should any third power bordering on the U.S.S.R.

or the Czechoslovak Republic, and representing in this war an object of German aggression, express a

desire to join the present agreement, the latter will be given the possibility of signing this agree-

ment . .

Meanwhile friendly relations between Czechoslovakia and the Soviet Union had been strengthened by the participation of at least two Czechoslovak battalions, composed mostly of Carpatho-Russians, in the fighting against the Germans on the Russian front. These troops had fought with the Poles against the Germans, were then interned in Russia, and were released to form an independent Czechoslovak military force under command of the Red Army through the Czechoslovak-Soviet agreements of July 18, and Sept. 28, 1941. By another agreement signed in Moscow May 29, 1943, the Soviet Government undertook to furnish funds, equipment, and services for the maintenance of the Czechoslovak units.

In a British-Czechoslovak accord of Ian. 22,

In a British-Czechoslovak accord of Jan. 22, 1943, the British undertook to make supplies and services for the Czechoslovak military forces in Britain available on a lend-lease basis. The Czechoslovak Government agreed to extend similar facilities to British armed forces if they were on Czechoslovak soil. In mid-August Czechoslovak troops which had fought with the British in Syria and North Africa arrived in Britain to join the Czecho-

slovak army there.

Early in 1943 the Yugoslav Government in exile tollowed other Allied Powers in repudiating the Munich Accord, under which Czechoslovakia lost the Sudetenland to Germany in 1938. By another agreement reached early in 1943, the Yugoslav Government arranged to attach Yugoslav recruits from outside of Yugoslavia to the Czechoslovak

army in Britain.

Internal Politics. The pro-Soviet policy of Beneš and his Covernment had some adverse repercussions in internal politics during 1943. In frequent radio broadcasts from London to Czechoslovakia Benes and his associates took pains to counter charges that the Czechoslovak Government had become the agent of Stalin and that its policy threatened the postwar independence of the Czechoslovak Republic. Somewhat similar, though less extreme, charges were made by anti-Soviet ele-ments among the Czechs and Slovaks who had taken refuge in Britain and the large immigrant communities in the United States. Stefan Osusky, former Czech Minister to Paris, headed an opposition movement to Benes in London. Former Premier Milan Hodza, who visited the United States during the year, was likewise strongly critical of the Beneš policies.

Another source of opposition to the Beneš Government in Slovakia and Carpatho-Russia and among some Slovaks and Ruthenians abroad was their long-standing opposition to Czech domination of the Czechoslovak Republic. The Government in exile, which included both Czechs and Slovaks, countered this sentiment by pledging a greater degree of local autonomy to nationality groups within the republic and promising to submit the Government's actions and policies to a popular vote as soon as possible after the restoration of independence. A second Carpatho-Russian was appointed to the Czechoslovak State Council in Lon-

don in February.

A formal statement of the Government's policy toward Slovakia was adopted June 30. It made plain that the secession of Slovakia from the Czechoslovak Republic on Mar. 14, 1939, would not be recognized; that there would be no future toleration of political parties likely to "undermine the liberty of the nation," a reference to the role

played by the Slovak People's party in 1938-39; and that there would be no compromise with the Rev. Joseph Tiso and his associates who had be-

trayed the republic.

With regard to the German and Hungarian minorities that were employed as tools for the partition of Czechoslovakia, President Beneš on February 18 proposed the compulsory transfer of unassimilable minorities to the countries of their choice after the war and the treatment of other minorities along the same lines as in America—without separate national rights but with all civil and democratic rights of the majority.

History; WORLD WAR.

#### DAHOMEY. See FRENCH WEST AFRICA.

DAIRYING. The number of milk cows on United States farms as of Jan. I, 1943, according to the U.S. Department of Agriculture, was 26,946,000, as compared with 26,398,000 a year earlier. The average value per cow was \$99.61 and the total value \$2,684,120,000. The number of cows in leading States was: 2,452,000 in Wisconsin; 1,845,000 in Minnesota; 1,544,000 in Iowa, and 1,532,000 in Texas.

Milk production in the United States in 1943 was estimated at 118,235,000,000 lb.—1,005,000,000 less than in 1942. The average daily production per cow was 12.15 lb. as of Jan. 1, 1944, ranging from 7.57 lb. of milk per cow in the South Central States to 15.13 lb. in the North Atlantic States. The goal for milk production in 1944 was set at 121,237,000,000 lb. In 1943 milk production failed to reach the proposed goal by about 4,000,000 lb. 000 000 lb.

The estimated quantities of milk utilized in 1948 for the more important dairy commodities were: whole milk cheese 9.785,000,000 lb, market milk

whole milk cheese 9,785,000,000 lb.; market milk 53,400,000,000; butter 41,856,000,000; evaporated and plain condensed milk 6,780,000,000; sweet-

ened condensed milk 225,000,000.

Milk products and by-products obtained included 4,100,000,000 lb. of cream for butter; 1,701,000,000 lb. of butter (a decrease from 2,228,000,000 lb. the previous year); 3,240,000,000 lb. of evaporated and plain condensed milk; 974,000,000 lb. of whole milk cheese, 8,800,000,000 lb. of whey; and 250,000,000 lb. of sweetened condensed milk. To compare production with that of the preceding year, see 1943 Year Book, p. 227. For a discussion of trends and developments, see Acriculture; Food Industry. For the Bureau of Dairy Industry, see Acriculture, U.S. Department of

DAKAR. See FRENCH WEST AFRICA.

DALMATIA. See YUGOSLAVIA under History.

DAMS. Of interest and great importance is the successful breaching of dams in Germany by aerial attacks of the Allied forces. It indicates what may be expected on a larger scale in future warfare. Placing the explosives in position to cause effective damage required intensive training and experiment by the force entrusted with these attacks. The breaching not only caused destructive floods, but destroyed or put out of service power plants serving large war industries. A first attack on an Italian concrete dam by aircraft carrying torpedoes failed on account of the massiveness of the concrete, and the enemy countered by placing torpedo nets. Success in other attacks resulted from the use of marine mines, which carry much more explosives than bombs.

Three dams were breached: the Moehne and Sorpe Dams which control 75 per cent of the drainage area of the Ruhr River, and the Eder Dam on the Weser River. In the Moehne gravity concrete dam, built in 1913, 132 ft. high and 2,145 ft. long, the breach was some 250 ft. wide and 42 ft. deep. The arched Eder Dam (1914), 157 ft. high and 1,310 ft. long, was breached in two places and tograph a doubt as the protection. two places and to such a depth as to practically drain the reservoir.

Numerous dams are essential features in the irrigation and power projects of the U.S. Bureau of Reclamation, but late in 1942 the War Production Board stopped work on all such structures then under construction. Later, it permitted resumption of work on several projects considered important for increasing food production on large areas in

1945 and 1946.

The Shasta Dam on the Sacramento River, key structure of the Central Valley project, California, is 90 per cent completed, and two of its five 70,000 kilowatt generators will be in service in March, 1944. With height of 602 ft. and crest length of 3,500 ft. it will be one of the three largest concrete dams in the world-higher than the Grand Coulee Dam and of greater volume than the Boulder Dam. A 97-mile transmission line is being built to deliver current to the distribution system of the Pacific Gas & Electric Co., which will take 150,000 kilowatts and pay the U.S. Government a minimum of \$2,775,000 annually.

On the same project and 8 miles further downstream, the Keswick Dam, under construction, is a straight gravity concrete dam, 138 ft. high and 912 ft. long. The Friant Dam, on the San Joaquin River, of the same type and on the same project, 320 ft. high and 3,430 ft. long, is ready to deliver water to the 37-mile Madera Canal, and 84-in. needle valves from the Boulder Dam will be installed temporarily to regulate the discharge. This Central Valley project is to conserve water for irrigation, power, flood control, navigation, salinity control, and for municipal and industrial purposes. The arch-type Altus Dam, Lugert-Altus project, is permitted to be built to sufficient height to provide a supplemental supply to Altus, Okla., and a neighboring military establishment. Eventually, it will be 110 ft. high and 1,100 ft. long.

Of earth and rock-fill-or embankment-dams, the highest in the world will be the Anderson Ranch Dam on the Boise project, Idaho, of the Reclamation Bureau; 440 ft. high and 1,350 ft. long. Its completion, authorized in October, 1943, is set for 1945, but the number of workmen is rigidly restricted on account of labor shortage. The Green Mountain Dam, 309 ft. high and 1,050 ft. long, on the Colorado-Big Thompson project, was completed and began delivery of current early in 1943 for Denver and war industries. Water from its reservoir will flow through the 18-mile Continental Divide tunnel for irrigation in northeastern

Colorado.

Work is progressing on the Deerfield Dam, Rapid Valley project, South Dakota, 100 ft. high and 800 ft. long, and on the Jackson Gulch Dam, Mancus project, Colorado, 130 ft. high and 1,930 ft. long. Two works authorized in 1943 for the replacement of old and deteriorated structures built by private interests, both in Utah, are the Newton Dam, 109 ft., and the Scofield Dam, 105 ft. high. At both the Friant and Shasta Dams, noted above, gold was recovered in washing gravel for concrete. At the Friant Dam, the total value was \$200,000, of which \$24,000 went for plant and operating costs, with the net \$176,000 divided

equally between the Bureau and the contractor. At the Boulder Dam, the twelfth generator of 75,000 kilowatts was installed in 1948.

Of the dams being built by the Corps of Engineers, U.S. Army, for flood control, power, and river regulation, the Denison Dam on the Red River, Texas, was completed in October, and power development is expected to begin in January 1944 control models about 1944 control models. ary, 1944, several months ahead of schedule. Work is to be started soon on the Fort Gibson Dam on the Grand River, Oklahoma. It will be 110 ft. high and 2,950 ft. long, supplemented by 11,500 ft. of earth dikes closing low spots in the shore line of the reservoir. Construction of the Barker Dam on Buffalo Bayou, Houston, Texas, was ordered stopped, but the War Production Board rescinded its order as the flood hazard was actually increased by the dam in its unfinished state.

The Tennessee Valley Authority, with the completion of the Kentucky and Fontana dams in 1944, will have no less than 27 dams, all but two of which are for power development as well as storage. Ten dams on the Tennessee River have locks for navigation. During 1943, the Douglas, Fort Loudoun, Apalachia, and Ocoee No. 3 dams were completed and their power plants put in operation. The Apalachia Dam, concrete gravity type, is 150 ft. high, but as its power house is 13 miles downstream the head of water on the turbines is about 400 ft. The Douglas Dam, of the same type, is 160 ft. high and 1,682 ft. long. Other dams and works are authorized by Congress but deferred

as postwar projects.

Failures of dams are rare, but on June 10 an earth dam on Sinker Creek, Idaho, collapsed after having been saturated by floods. It was 70 ft. high and 1,100 ft. long, built in 1910 by an irrigation

At Seattle, Wash., a contract was let in February, 1943, for adding 182 ft. to the height of the Ross Dam on the Skagit River, making its height 490 ft. This multiple-arch concrete dam is part of the city's hydroelectric development for municipal service. Power development for Tacoma, Wash., will be increased by the Nisqually River project, which includes the Alter and LaGrange dams, both serving the Alter power house. At both of these cities, war conditions increased the cost so far above the original estimates as to necessitate revision of the financing plans.

For additional water supply at San Diego, Calif., the San Vicente Dam was completed in March. Its present height is 190 ft., but the design provides for its extension to 300 ft. when needed. Contract for an arch dam 200 ft. high on the Sweetwater was placed in August. Water supply at Santa Fe, N.M., was increased with the completion of the Nichols Dam, 85 ft. high. It is an earth fill of the semi-hydraulic type; that is, the earth was hauled to the site in trucks and then distributed by

hydraulic jets.

Foreign Dams. The breaching of concrete dams in Germany by aerial attacks has been noted above. An ambitious project revived in England is for a great dam across the estuary of the Severn River, just above the head of the Bristol Channel. Its special feature is in utilization of a tidal rise and fall of some 30 ft. twice daily. The power dam, 4,550 ft. long, with 72 turbines, would be parallel with the stream and at right angles with a spillway dam 6,800 ft. long. Locks would provide for navigation. Shipping interests are strongly opposed, on account of predicted serious effects in shoaling and other troubles resulting from interference with such great tidal forces. In view of the enormous cost and the time required for construction, the Government has refused approval of the project at this time.

A small dam on the Ogoki River in Ontario, Canada, is of international importance in diverting water that formerly flowed northward to Hudson's Bay so as to flow southward and indirectly into Lake Superior. There is also a new connection between Long Lake and Lake Superior to float pulpwood and add to the flow through the Great Lakes. Another Canadian project is for a dam and causeway across the Canso Strait between the mainland of Nova Scotia and Cape Breton Island. There is heavy traffic with mines and steel mills on the island, and the present ferry service is costly. A channel would be left for navigation.

In Mexico, the Azucar earth-fill dam, four miles long, on the San Juan River, was reported completed in 1943, for irrigation purposes. The government plans to begin work in 1944 on an irrigation dam near Nejapa, Oaxaca, on the isthmus of Tehuantepec. In Costa Rica, a concrete dam for power development on the Virilla River, near San Jose, was practically completed in 1943. It is 33 ft. high and 200 ft. long. An old overflow dam 7 ft. high and 760 ft. long, on the Tunuyan River in Argentina, has been rebuilt as a high dam with sluice gates, to serve irrigation canals on both

sides of the river.

Both South Africa and Australia have large dams planned for irrigation and power development projects after the war. Two of the more definite projects in the Union of South Africa are on the Orange River at Bethulie, and the Caledon River at Ficksburg, the latter diverting water through a 21-mile tunnel to irrigate lands on the opposite side of a mountain range. The government of Victoria, Australia, has started work on the Kilwa River project, where dams will form reservoirs at 5,500 ft. above sea level, and canals and tunnels will deliver the water to a series of dams and power plants. The great dam, with locks and power plant, on the Dnieper River, was reported breached in October, 1943, by the retreating Germans. In 1941, it was partly destroyed by the retreating Russians, but partly repaired by the then advancing Germans. See Flood Control; Tunnels; Water Supply.

DEFENSE TRANSPORTATION, Office of (ODT). Created by executive order, Dec. 18, 1941, the Office of Defense Transportation was charged by the President with responsibility for assuring maximum utilization of the domestic transportation facilities of the nation for the successful prosecution of the war. Joseph B. Eastman, Chairman of the Interstate Commerce Commission, was appointed Director of the agency.

To meet conditions produced by increased traffic, growing equipment stringencies, tightening of the manpower supply, and other factors, ODT in 1943 broadened some of the controls instituted in 1942 and put into effect new measures for conservation of transportation. While growth of war traffic subjected all types of domestic transportation to increasing strain, no serious failures or interruptions of service occurred during the year.

The railways (q.v.), which performed by far the largest proportion of intercity freight transportation service, experienced an increase of 15 per cent in that traffic. Railroad passenger traffic rose by more than 65 per cent over the record total of 1942. To avert threatened congestion of rail freight movement on the western transcontinental lines, the Associate Director of ODT's Division of Railway Transport, in charge of the western region, was vested early in the year with Interstate Commerce Commission powers to divert traffic from heavily burdened to less crowded routes. Authority to divert rail freight traffic was extended to the eastern and southern regions late in 1948.

Rail deliveries of petroleum products to the East Coast reached a peak of over a million barrels a day in July, 1943, most of this oil moving in solid trains of tank cars under ODT supervision. General Orders ODT 1 and 18, requiring heavier loading of freight cars; measures for pooling of refrigerator cars and for utilization of such cars for transport of general freight in the direction of the normal empty movement; arrangements to facilitate leasing of locomotives to roads short of motive power; and other conservation steps helped to avert or alleviate railroad equipment shortages.

In October, 1943, a War Transportation Efficiency Committee, composed of representatives of ODT, ICC, and railroad and shipper organizations, was formed under Director Eastman's chairmanship to direct a campaign for attainment of an additional increase of 10 per cent in efficiency of railroad freight operations. During the year the ODT continued its efforts to relieve crowded travel conditions through campaigns for voluntary curtailment of unnecessary civilian travel on trains and intercity buses, and for cancellation of conventions and similar group meetings not directly related to the war effort.

Numerous joint action plans for pooling use of truck, bus, or taxicab facilities were placed in effect. Advent of an acute gasoline shortage in the Northeast in May, 1943, caused ODT to order sharp emergency reductions in commercial motor vehicle mileage and restriction of wholesale and retail deliveries in that region. The emergency restrictions on bus and taxicab mileage were modified

in August but, owing to the increasing necessity for truck conservation, the restrictions on deliveries were extended to the whole country in October. In June, 1943, ODT revised its permit system

In June, 1943, ODT revised its permit system for control of Great Lakes shipping. Principally because of late opening of the navigation season, the volume of iron ore shipped down the Lakes dropped from the record total of 92,000,000 gross tons in 1942 to 84,400,000 gross tons in 1943. The grain movement in United States ships on the Lakes rose, however, from 111,000,000 bushels in 1942 to around 184,000,000 bushels in 1943.

Designation of ODT as claimant agency for domestic transportation under the Controlled Materials Plan of the War Production Board was announced in January, 1943. The agency acts also as claimant for gasoline and rubber for highway use. The Office of Defense Transportation established a regional office in Hawaii in the summer of 1943. See Railways.

Officers. The Governor is Walter W. Bacon (Rep.), inaugurated in January, 1941, for a four-year term; Lieutenant Governor, Isaac J. Mac-Collum; Secretary of State, William J. Storey; Attorney General, Clair J. Killoran.

DEMOBILIZATION. See ARMED FORCES.
DEMOCRATIC PARTY. See ELECTIONS; UNITED STATES under Politics.

DENMARK. A formerly independent kingdom of northwestern Europe, occupied by German armed forces on Apr. 9, 1940. It comprises the peninsula of Jutland, the two main islands of Zealand and Fyn, and about 200 smaller adjacent islands in the Baltic. The Faeroe Islands (q.v.), an integral part of the kingdom, were occupied by British troops on Apr. 13, 1940, for the duration of the war. Greenland (q.v.), a Danish dependency, remained under the control of the local Danish administration but accepted United States protection for the duration of the conflict. The King of Denmark is also King of Iceland, although the Icelandic Althing (parliament) on May 16, 1941, voted to terminate this personal union at the end of the war and elected a regent during the interim (see Iceland under Government). Capital of Denmark, Copenhagen. King, Christian X, who succeeded to the throne May 14, 1912.

Area and Population. Area, excluding the outlying possessions, 16,576 square miles. Estimated population on June 30, 1941, 3,863,000, including 26,000 in the Faeroe Islands, as compared with 3,844,-

000° at the census of Nov. 5, 1940. The live birth rate per 1,000 inhabitants was 20.5 in 1942 (18.5 in 1941); death rate, 9.7 (10.3). Populations of the chief cities at the 1935 census were: Copenhagen, 843,168; Aarhus, 90,898; Odense, 76,116; Aalborg, 48,132.

Education and Religion. There is no illiteracy. The 4,472 lower schools had 480,000 pupils on Jan. 1, 1938; secondary, professional, and vocational schools, 74,100; the two universities at Copenhagen and Aarhus, 5,700. The 1921 census showed 3,221,-843 Protestants, 22,137 Roman Catholics, 5,947 Jews.

Production. Previous to the German occupation, 35 per cent of the working population was engaged in agriculture and dairying and 33 per cent in industry. Commerce and fishing were the other leading occupations. Livestock estimates as of November, 1940, with figures for July, 1939, in parentheses, show the preliminary effects of the German occupation upon Denmark's most important industry: Cattle, 2,976,000 (3,271,000); swine, 2,528,000 (3,182,000); chickens, 11,260,000 (3,-296,000). Further drastic reductions in livestock occurred during 1941-43, except for the rabbit population, which increased from an estimated 240,000 in 1938 to about 1,000,000 in 1942. The total output of animal products in February, 1942, amounted to about one-half of the normal preamounted to about one-nair of the normal pre-war production. Dairy production in the first quar-ter of 1943 was: Milk, 1,313,400,000 lb.; butter, 47,300,000 lb.; cheese, 9,900,000 lb. Cereal crops totaled about 3,750,000 metric tons in 1942 (2,710,000 in 1941); potatoes, 1,700,000 metric tons in 1942 (an increase of 28.8 per cent over 1941); beet sugar, 306,000 short tons in 1941. Sea fisheries yielded 114,200 metric tons of fish in 1940. Lignite output in 1942 was 1,600,000 tons, a 60 per cent increase over 1941; peat, 4,700,000 tons as against a normal output of 400,000 tons. The higher fuel production was due to the decline of coal and coke imports from Germany.

Foreign Trade. Merchandise imports in 1942 totaled 1,204,800,000 Danish crowns (1,310,400,000 in 1941); exports, 1,038,000,000 crowns (1,276,800,000 in 1941). Imports from Germany were estimated at 843,000,000 crowns, or 70 per cent of the 1942 total, and exports to Germany at 726,600,000 crowns (70 per cent). In 1941, 80 per cent of all Danish trade was with Germany. In the Danish-German clearing account, the balance due Denmark increased by 263,100,000 crowns during 1942 to a total of 1,105,200,000 crowns.

Finance. Budget estimates for the fiscal year ended Mar. 31, 1944, placed current revenue at 718,900,000 crowns (822,400,000 in 1942–43) and current expenditure at 962,500,000 crowns (909,900,000 in 1942–43). The German levy on Denmark to meet occupation costs was reported at 429,500,000 crowns for 1942. Public debt on Mar. 31, 1941, 1,211,600,000 crowns. At the official exchange rate (4.79 crowns equal \$1) in 1942, the crown was equivalent to \$0.2088 (\$0.1931 in 1941).

Transportation. In 1941 Denmark had 3,189 miles of railway line (1,625 miles state-owned) and 32,-

Transportation. In 1941 Denmark had 3,189 miles of railway line (1,625 miles state-owned) and 32,-212 miles of highways. Air lines linked Copenhagen with the chief cities of the continent. Lack of fuel and rubber curtailed virtually all forms of transportation. The speed limit for motor traffic in 1942 was 15 miles an hour. The volume of goods in foreign trade loaded and discharged in Danish harbors dropped to 5,205,000 tons in 1942 from 12,651,000 tons in 1938. In 1942 the number of vessels calling at Danish ports in foreign and domestic trade numbered 45,800; goods discharged,

6,673,000 tons. Two-thirds of all Danish oceangoing ships were outside Denmark at the time of the German invasion; these ships, with more than 5,000 Danish sailors, later entered the service of

the United Nations.

Government. The Constitution of June 5, 1915, as amended Sept. 10, 1920, vests executive power in the King acting through a cabinet responsible to the Rigsdag (Parliament). Legislative power rests jointly in the King and Rigsdag. The Folketing (lower chamber of the Rigsdag) consists of 149 members elected for four years by proportional representation. The Landsting (upper chamber) comprises 76 members serving for eight years; 19 members are elected by the Landsting itself and every four years half the remainder is elected indirectly by voters of over 35 years. Premier and Foreign Minister at the beginning of 1943, Eric Scavenius, heading a coalition government of the Social Democratic, Radical, Liberal, and Conservative parties, formed Nov. 10, 1942. These four parties and the Justice League, controlling 137 out of the 149 seats in the Folketing, on July 3, 1940, formally agreed "to abandon all points of disagreement and unite to make sure the independence and integrity promised our country." The Danish Communist party was outlawed in 1941 under German pressure. For developments in 1943, see below.

### HISTORY

Gestapo Takes Over. Three and a half years of persistent German efforts to win the Danish Government and people over to willing collaboration with Hitler's "new order" ended in failure on Aug. 29, 1943. On that date the German military commander, Maj. Gen. Hermann von Hanneken, proclaimed martial law. The Scavenius Government immediately resigned. King Christian and Queen Alexandrine were interned in their summer residence near Copenhagen and the King's functions were "suspended." German troops and Gestapo units began rounding up members of the King's households and of the Government, army and navy officers, prominent intellectuals, outspoken patriots, and Jews.

All legislative and executive powers were taken over by the German military commander and by the German Minister to Copenhagen, Dr. Karl Rudolf Werner Best. In open violation of the pledge of noninterference in internal Danish affairs given by Hitler at the time of the German invasion in 1940, Denmark was shorn of every vestige of independence and placed under a harsh military dictatorship directed from Berlin. For the first time the Danish people were exposed to the full impact of the brutal Gestapo methods of punishment and

repression.

Denmark had narrowly escaped a similar fate in November, 1942, when the newly formed Scavenius Government rejected several important demands forming part of a German ultimatum (see 1943 Year Book). The German authorities were anxious to retain a Danish Government in office as a demonstration of the advantages that the other subject nations of Europe might derive from collaboration with Berlin. Accordingly they accepted the Government's promise of more active measures against the leaders of the anti-German underground. On the other hand, the Scavenius Government was supported by the anti-Nazi Danish political parties "as a last attempt to keep some power in Danish hands." King Christian, who was slowly recovering from his serious illness of the preceding autumn, likewise placed his immense prestige behind the Government. (In mid-May the King

was able to resume the powers which he had transferred to Crown Prince Frederick the previous October 27.)

The March Elections. After first informing the Scavenius Government that the Reich could not permit the spring elections to the Folketing, Minister Best on March 8 changed his mind and authorized the holding of the elections on March 23 as a sign of Germany's purely "protective interest" in Denmark. Germany, he indicated, was ready to guarantee the constitution and sovereignty of Denmark "if the people and Government will adopt a suit-

able attitude."

The Danish democratic parties were restricted in electioneering to the distribution of a leaflet bearing the single word "vote." Nevertheless 2,009,295 votes were cast, representing 90 per cent of the electorate. The democratic parties forming the Government coalition were confirmed in power with overwhelming majorities. The Danish Nazis, who were supported by the German minority in Slesvig, polled 43,277 votes against about 46,000 received by Danish Nazis and minority German candidates in 1939. Votes polled by the democratic parties were (1939 totals in parentheses): Social Democrats, 894,636 (729,619); Conservatives, 421,051 (301,625); Liberals, 376,463 (309,155); Radicals, 175,025 (161,839); Right Union (Justice League), 31,185 (33,783). The Opposition Peasants' party, considered mildly pro-Nazi, got only 24,700 votes, or 23,000 less than in 1939.

The Germans were prepared to interpret the elections as evidence of Danish support for the

The Germans were prepared to interpret the elections as evidence of Danish support for the partially collaborationist Scavenius Government. However this maneuver was forestalled by the declarations of all the major parties that faith in democracy, not faith in the Government, was the central issue. Municipal elections held throughout Denmark on May 6 showed almost identical results. An active election campaign in Copenhagen netted the Danish Nazis only 2 per cent of the

total vote.

Growth of Sabotage. The elections demonstrated that the Danish people as a whole could never be induced to follow the handful of Danish Nazis into willing collaboration with Berlin. Moreover the returns convinced the German authorities that a constitutional Danish Government could not be expected to deal effectively with the rising tide of sabotage, which had become a serious problem in 1942.

Allied victories in Russia and North Africa and an R.A.F. daylight bombing of the big Burmeister and Wain shipyards in Copenhagen on Jan. 27, 1943, inaugurated a more formidable wave of sabotage. Within two weeks in February four large Danish industrial plants working on German war orders were destroyed by fire or explosions. Other sabotage attacks interrupted service on railways and highways. German threats to oust the Government led a committee of the government parties to warn the nation on April 4 that continuance of sabotage menaced the degree of self-government which Denmark still retained. The very next night fires broke out in five or more plants in the factory town of Hilleroed, near Copenhagen.

town of Hilleroed, near Copenhagen.
On or about April 9, the third anniversary of the German invasion, General von Hanneken reportedly presented Premier Scavenius with another ultimatum. He demanded that specific Danish officials and industrialists be made responsible for the prevention of sabotage and punished by arrest or possible execution if the incidents continued. Secondly, he insisted that Danish industry be placed under more direct German control, with Danish

business men reporting to a German commissioner as in Norway. While negotiations continued sabotage and other anti-German activities increased, notwithstanding an appeal from King Christian is-

sued in May.

Rejecting the advice of their elders, young Danes flocked into the underground organizations. Illegal newspapers were issued in large numbers, with a steadily mounting circulation. When the Germans in May and June began to strengthen the Jutland garrison and intensify preparations to resist an Allied landing, the saboteurs concentrated their efforts upon German troop trains, railways, and barracks. Attacks upon German soldiers and Danish Nazis became more frequent. Under orders of the Scavenius Government, Danish police arrested and imprisoned many Danes engaged in these activities. This policy aroused a rising public clamor for an administration that would be more militant in resisting German pressure. Meanwhile the German authorities pressed for more drastic measures against the underground.

The August Crisis. The Swedish Government's action in barring further passage of German troops and supplies en route to Norway and Finland, effective August 15, brought the situation in Denmark to a head. Sweden's move forced the Germans to rely exclusively upon Danish transportation facilities to supply and reinforce their garrisons in Norway. With an Anglo-American invasion impending, the curbing of sabotage in Denmark became imperative to the German high command.

On August 4, soon after the decision of the Swedish Government was transmitted to Berlin, the German Minister in Copenhagen demanded that all Danish saboteurs be handed over for trial by German courts. When the Danish Government refused and Premier Scavenius on August 9 offered his resignation, Dr. Best shelved the German demand for the time being. Meanwhile news of the German demand and of new German atrocities in Norway had set off a wave of even more destructive sabotage, accompanied by strikes and attacks upon German soldiers. Clashes between Danish crowds and German soldiers in Esbjerg and Aalborg led the Germans to impose a state of siege in those cities in mid-August. Similar restrictions were imposed upon the island of Fyn after a street battle between German and Danish soldiers in Odense.

On August 20, members of the Government, Parliament, and leaders of the government parties met in Copenhagen to consider their course. They decided not to yield to German demands for the trial of saboteurs in German courts. But they approved a formal Government appeal, issued August 21, for an end to "unlawful" anti-German actions. The appeal warned the Danes that the Germans might cut off imports of food and fuel, with devastating results on Danish life. The aroused Danes disregarded this warning. Anti-German demonstrations and riots spread to Copenhagen and other cities and towns. The Germans rushed large numbers of troops into Copenhagen and other centers. They made numerous arrests and extended the emergency decrees. This only added fuel to the fire of Danish resistance.

The German Minister then presented the Scavenius Government with the following demands: (I) Declaration of a state of siege applying to all Denmark, (2) creation of special tribunals empowered to sentence Danish saboteurs to death, (3) delivery to the Germans before September 1 of all firearms and ammunition in Danish possession, (4) imposition of a nationwide curfew from

8:30 p.m. to 6:30 a.m. for the duration of the state of siege, (5) levying of a million-crown fine on the people of Odense for anti-German outbreaks, (6) punishment of every Dane assaulting other Danes friendly to the Germans, (7) a ban on strikes and on public or private gatherings of more than five persons, (8) complete German control of the Danish press.

These demands were also rejected by the Scavenius Government. The Cabinet's decision was said to have been unanimous, after King Christian threatened to abdicate if the demands were accepted. The German Minister was then called to Berlin (about August 27). On August 28 telephone and telegraph communication from Denmark was cut off. At 4:10 a.m. the next morning General Hanneken proclaimed martial law and overthrew the constitutional regime in Denmark on the ground that the Government had been un-

able to maintain order.

The proclamation banned until further notice all strikes, private or public assembly, and the use by Danish citizens of mail, telephone, and telegraph services. A dusk to dawn curfew was imposed. Danish authorities and officials were ordered to continue loyal fulfillment of their duties in accordance with regulations issued by the German military authorities. The Danes were warned that any disobedience would be met by ruthless use of arms. German military and civil officials were installed in all key posts of the Danish civil administration.

Danish Resistance. The Danes fought much more bitterly against the crushing of their civil government than they had against the original German invasion in 1940. On orders of the commander in chief of the tiny Danish navy, 20 small ships were reportedly scuttled in Copenhagen harbor, while nine others escaped to Swedish ports. Danish soldiers in Copenhagen and the provinces were said to have blown up fortifications and resisted the Germans until overpowered.

Disarming of these troops and mass arrests of Danish patriot leaders failed to end resistance. Many Danish policemen refused to swear allegiance to the German military commander. Thereupon German Elite Guard troops and Gestapo agents took over the police stations. Strikes paralyzed nearly a dozen provincial towns, despite von Hanneken's threat that strikers would be executed. Sabotage increased in the face of the establishment of German courts-martial for the summary trial of saboteurs, with death prescribed for serious offenses.

On September I General von Hanneken proclaimed a state of emergency in place of the more drastic martial law decree. At the same time Dr. Best made the first of several efforts to reestablish a Danish constitutional regime that would accept many of the controls imposed under German military rule. The King and the members of the former Scavenius Government rejected all advances.

Continued sabotage led the Germans to restore martial law on September 3. Two days later they decreed the death penalty not only for sabotage and espionage but also for sheltering persons engaged in anti-German activities and for failing to inform the German authorities of plans to obstruct the German war effort. A subsequent decree imposed the death penalty for the possession of arms or ammunition. Heavy fines were levied on Copenhagen in reprisal for killings of German soldiers.

hagen in reprisal for killings of German soldiers. On September 28 General von Hanneken was reported to have been replaced as military commander in Denmark by Gen. Kurt Daluege, a high Gestapo official who as Acting Protector of Bohemia and Moravia had inflicted a bloody reign of terror upon the Czechs. This report coincided with a ruthless purge of the 6,000 Danish Jews. Despite vigorous protests by King Christian and representatives of the five leading Danish political parties, the Jews were rounded up and shipped off at short notice to Germany and Poland. Their homes, furniture, and businesses were confiscated without compensation. More than 1,000 Danish Jews, however, managed to escape to Sweden with

the connivance of the Danish police.

Early in October the Germans released from internment the Danish soldiers and sailors captured on August 29, even though the latter refused to sign pledges binding them to abstain from anti-German activities. This gesture was accompanied by the disarming of the Danish police and the internment of many police officers for failing to prevent the escape of Jews to Sweden. Many faculty members of the universities of Copenhagen and Aarhus were arrested for displaying pro-Jewish sympathies. Meanwhile the underground warfare waged against the Germans steadily increased in bitterness and effectiveness. The Gestapo, aided by the Danish Nazis, resorted more and more openly to the cruel methods of repression in vogue in other German-occupied countries. See Bridges; Refugees; Socialism; Sweden.

**DENTISTRY.** Most of the year's activities in dentistry have been directed toward the prosecution of the war and represent the natural evolution of trends already noted for 1942. Only in the field of dental education has there been radical rearrangement

and change.

Education. Early in the year both armed forces indicated that plans were being formulated to change radically the set-up in both dental and medical schools. The proposed plans covered all phases of training beyond high school: basic preprofessional college, preclinical and clinical areas. Although there was a general similarity between the Army and Navy proposals, the pre-professional schedules differed materially as to the amount of credit to be required, the length of the school year divisions (semester and trimester), and the subject content. Editorially and otherwise (J.A.D.A., April, 1943) it was intimated that dentistry was already operating an accelerated, highly efficient program of training and that the schools had promptly complied with all requests of the armed services. Furthermore, it was the opinion that the proposed plans were unduly costly, both financially and ad-ministratively, and that "in the end it will transpire that there was really no occasion for it."

However, by the middle of the summer most

of the dental schools had signed agreements with the Army and Navy, and by the end of the year thirty-eight schools were operating under contracts with one or both of the services. A typical example follows: As of Nov. 1, 1943, this school had an enrollment of 318 (317 as of the same date in direction, 184 under the Army, and 25 are civilian students. Three of the last group are women, the remainder are aliens or ineligible for service. Both Navy and Army groups are in uniforms appropriate for their rank and service; each student is paid slightly in excess of \$55 per month with additional allowances for room, board, books, instruments, and tuition. Students live for the most part close to the school wherever places are available but cannot leave the designated school area (50-mile zone) without permits. Many other units have

been able to supply living quarters on the school campus. There have been no noteworthy changes in the faculty personnel and educational program. Under the last revision of the Harvard plan, to

become effective with the admission of this year's first-year class, 15 students will be admitted to the dental course each year but as a part of the Harvard quota of 125 taken into the first-year course in medicine. Dental students will be treated exactly as if they were medical students for the first two scholastic years. The last two years of the dental course will be devoted to an intensive training in technical and clinical dentistry. Successful completion of the four scholastic years as outlined will rate the D.M.D. degree (accepted equivalent of the D.D.S. degree in dentistry awarded by most dental schools). Satisfactory accomplishment of one and one-half scholastic years of training in clinical medicine in addition will secure the M.D. degree; it will, therefore, be possible to earn both degrees at the end of five and

one-half years of study in the combined course.

Organized Dentistry. General meetings of national professional societies in many instances have been replaced by executive sessions for the transaction of necessary and routine business. The American Dental Association met in Cincinnati under such circumstances in early October. Many other groups correlated their executive activities accordingly. Well attended regional meetings (as in Chicago, New York, and elsewhere) with well arranged programs containing informative and timely papers and instructive clinical demonstrations still supply excellent and generous opportunities for the exchange of ideas and acquirement of essential information about the current progress in the recognition and treatment of dental diseases. A small but representative group of United States dentists participated in the Medical-Dental Convention in the City of Mexico in March. The Kellogg Foundation supported a group of 21 Hispano-American dentists for six months study and observation of professional study and practice in this country. Both of these enterprises and others have had the efficient support and backing of the active Pan-American Committee of the American Dental Association. Sixty dentists met in February to promote the organization of industrial dentists which was consummated in Cincinnati in October.

Dental Practice and Research. At the close of 1942, 12,700 dentists were in Army service. The quota for 1943 called for 9,500 in addition to these, only about 3,500 of whom could be supplied even by the accelerated programs of the schools; the bal-ance of about 6,000 will have to come from dentists engaged in private practice. Only a few of these can be replaced in private practice by grad-uates not eligible for military service so that there is very little hope of lessening the heavy pressure on the private practitioner until demobilization begins. The increased personnel in both the Army and Navy has been recognized by elevating the two ranking officers in those services to that of Major General and Vice Admiral respectively.

Interest is growing in military dentistry, especially in the output of textbooks designed for use in training the dentist for the armed services; so far there has been no noteworthy expansion of pertinent periodical content. Otherwise periodical literature deals mostly with routine material concerned with clinical practice. Research, largely dormant, relates to use of the sulfa drugs, exploitation of the synthetic acrylic resins, and search for agents to inhibit dental decay. In the last respect the emphasis is still given to the fluorides.

DISCIPLES OF CHRIST. This communion, known also as the Churches of Christ and Christian Churches, sprang from a movement for Christian unity, which arose in American Presbyterian circles at the beginning of the 19th century, under Barton W. Stone, in Kentucky, and Thomas and Alexander Campbell in Western Pennsylvania. This is the largest religious body having its origin in America. It was fifth among Protestant communions in the United States in 1943. In policy the churches are congregational. There are six major agencies of the communion: The United Christian Missionary Society; Board of Higher Education; Association for the Promotion of Christian Unity; Pension Fund; National Benevolent Association; and Board of Church Extension, besides the missionary societies of the several states and provinces of Canada. These agencies are corporations and are affiliated with the International Convention of Disciples of Christ which meets annually. The general missionary work both home and foreign of the churches is administered through the United Christian Missionary Society, with headquarters at 222 South Downey Avenue, Indianapolis, Ind. Its board of managers of 120 is composed of 60 men and 60 women. The foreign missionary work in 1943 embraced the Belgian Congo in Africa, China, India, Jamaica, Japan, Mexico, Philippine Islands, Puerto Rico, Argentina, Paraguay, and Batang, on the border of Tibet. However, because of the war, work in Japan and the Philippine Islands is suspended.

Statistics of the communion show that during the year there were 5,439 baptisms in the foreign fields. The 338 mission schools had a total enrollment of 14,386. The communion maintained 11 hospitals and 16 dispensaries which gave 516,277 treatments. The Church Extension Fund amounted to \$2,841,987 with outstanding loans to 404 churches. The Pension Fund for the ministry showed assets of \$3,655,264. During the year 106 young people's conferences were held. Work in America was conducted among the French, High-landers, European immigrants, Negroes, Orientals, Spanish-Americans, and Mexicans. The National Benevolent Association maintained six homes for children, and an equal number of homes for the aged. In 1943, 26 Colleges, Universities, Bible Colleges, and Foundations cooperated with the Board of Higher Education. The total church membership throughout the world in 1943 was 1,842,123; and in the United States and Canada 1,679,012. The Bible School enrollment for the world was 1,067,302, and for the United States and Canada, 1,008,588. Contributions, missionary, benevolent, and educational, reported for the fiscal year in the United States and Canada totaled \$5,505,779.

Among the periodicals published by the communion are World Call, The Christian Evangelist, Christian Standard, and Front Rank. The president of the International Convention was Dr. C. E. Lemmon, Columbia, Mo. No convention was held during the year.

DISINFECTANTS. See CHEMISTRY under Insecticides and Disinfectants.

DISTRICT OF COLUMBIA. An area conterminous with the city of Washington, seat of the U.S. Government. Area: 69 sq. mi. Population: 658,018 (1940 census); 839,013 (1943 nonmilitary estimate).

Statistics. Statistical information pertaining to the District of Columbia and each of the 48 States has been assembled in comparative tables which appear in the following articles. Roads and Streets; Schools; Social Security Board; Taxation; Universities; and Vital Statistics. The census of manufactures has been suspended for the time being; for the latest information, see 1941

YEAR BOOK, p. 430.

Officers. The District is administered by a threeman board of Commissioners, two of whom are appointed by the President and confirmed by the Senate for three-year terms. The third Commissioner is selected by the President from time to time from the U.S. Army Corps of Engineers. The Commissioners in 1943 were: John Russell Young, President; Guy Mason; and Col. C. W. Kutz, Corps of Engineers, U.S.A.

DOGS. Transcending anything that happened in the show ring in 1943 was the heroism of the dogs serving with the Army, Navy, Marines, and Coast Guard in many theaters of war. Breeders once again centered their activities around Dogs for Defense, Inc., which has contributed greatly to our national war effort by procuring obedient dogs for service with our armed forces at home and abroad.

Exhibitors, despite the handicaps of food and gasoline rationing, had a successful, albeit a limited, season. The biggest bench show of the year, Westminster, held in Madison Square Garden, furnished a sensational surprise when Champion Pitter Patter of Piperscroft, who never had gained an all-breed victory, went best in show. The imported miniature poodle, owned by Mrs. P. H. B. Frelinghuysen of Morristown, N.J., was the first of its breed ever to figure in the final judging at a Westminster show. Best American-bred was the Irish water spaniel Ch. Mahoney's O'Toole, owned by Mrs. Charles M. Wynne of Highland Park, Ill. Mrs. George A. Anderson's whippet, Ch. Flor-

Mrs. George A. Anderson's whippet, Ch. Flornell Glamorous, a consistent winner all year, proved best in the Katonah show, which was transferred

to Rye, N.Y.

In the field, A. G. C. Sage's liver and white pointer, Ariel, regained the bird dog championship and the Labrador Shed of Arden took retriever honors to give Lieut. Paul Bakewell 3d the prize for the fourth straight year. High spot of the season for springers was the Fisher's Island competition, which was won by Captain and Mrs. James Simpson's Stoneybroke Sheerbliss.

DOMINICA. See WINDWARD ISLANDS.

DOMINICAN REPUBLIC. A West Indian state, occupying the eastern two-thirds of the island of Hispaniola (Haiti). The name of the capital was changed from Santo Domingo to Ciudad Trujillo, Jan. 9, 1936.

Area and Population. Area, 19,325 square miles; population, estimated in 1941 at 1,768,163. About 40 per cent of the inhabitants are white (mainly of Spanish descent), 40 per cent mixed, and 20 per cent Negro. American citizens, including Puerto Ricans, in the republic in 1941 numbered 3,158; other foreigners in 1935—Haitians, 52,657; British subjects, 9,272; Spaniards, 1,572. Populations of the chief cities (1935 census): Ciudad Trujillo, 71,297; Santiago de los Caballeros, 33,919; San Pedro de Macorís, 18,889; Puerto Plata, 11,777. Defense. As of Jan. 1, 1941, there were 3,085

Defense. As of Jan. I, 1941, there were 3,085 officers and men in the active army (including air forces), and I,675 trained reserves. The municipal police, organized as a national constabulary in 1936, form an auxiliary branch of the army. There are four coastal patrol vessels. National defense budget for 1942, \$2,114,000. A U.S. naval mission was contracted for Jan. 25, 1943, for four years. Education and Religion. Four-fifths of all adults

Education and Religion. Four-fifths of all adults were illiterate at the 1935 census. At the beginning of 1943 there were 863 primary schools with 123,-641 pupils, 16 secondary schools with 3,133 pupils, 57 vocational schools with 3,702 pupils, and 5 special night schools for illiterate adults with 584 pupils. The University of Santo Domingo had about 350 students. In 1942 a National Conservatory of Music and Declamation was opened in Ciudad Trujillo. An eight-year program to teach English to high school students was launched in 1943. About 97 per cent of the Dominicans are Roman Catholics.

Production. Agriculture supports about four-fifths of the population. Sugar cane is the chief crop, yielding 530,000 short tons of sugar from 225,000 acres in 1941–42. In 1943 there were 14 sugar centrals with 70,000 workers and a capital investment of \$70,000,000. Cacao exports in 1941 totaled 19,287 metric tons; coffee, 201,821 bags (of 132 lb.). Yucca starch, placer gold, com, rice, cattle, and bananas are other exports. Products for home consumption include potatoes, beans, onions, peanuts, pineapples, etc. The forests produce cabinet and dye woods.

Foreign Trade. Imports in 1942 totaled \$11,480,-

857 (\$11,739,031 in 1941); exports, \$20,040,000 (\$17,123,937 in 1941). Values of the chief 1941 exports: Raw sugar, \$7,830,000; cacao, \$2,250,000; coffee, \$1,473,000; molasses, \$1,272,000; yucca starch, \$975,000. The United States supplied 75.4 per cent of the 1941 imports (66.5 in 1940) and took 51.4 per cent of the exports (24.6 in 1940). Sugar exports for the 1942–43 season were 189,920 metric tons, valued at \$10,361,521. The entire crop was sold to the British Government through the U.S. Commodity Credit Corporation.

Finance. In 1942 governmental revenues totaled \$14,943,062 and expenditures \$12,787,925, leaving a surplus of \$2,155,136. The foreign funded (dollar) debt totaled \$14,316,000 on Feb. 28, 1942; internal (floating debt), about \$3,265,104. The Dominican peso is equal to one U.S. dollar.

Transportation. In 1941 the government decided to suspend service on 134 miles of common-carrier railway lines and convert the roadbeds into highways. There were in 1943 about 2,300 miles of roads, which handled the bulk of overland traffic. Pan American Airways provides connections with San Pedro de Macorís for the Caribbean circuit. There is a deep-water port at Ciudad Trujillo and harbors for smaller vessels at Azua, Barahona, La Romana, Monte Cristi, Puerto Plata, Sanchez, and San Pedro de Macorís. To overcome the wartime shipping shortage, the Government in 1943 placed in operation small motor-driven schooners, built in the republic with credits and materials furnished by the United States.

Government. The Constitution of 1929, as revised in 1934 and on Dec. 16, 1941, vested executive power in a President elected for five years and legislative power in a Congress of 16 Senators and 30 Deputies, elected for four years by direct suffrage of literate males and females. However, Gen. Rafael Leonidas Trujillo Molina's Dominican party is the only political organization permitted. Trujillo, who headed a successful military revolt, was President from Aug. 16, 1930, to Aug. 16, 1938, when he was succeeded by his own candidate. Trujillo was reelected President without opposition on May 16, 1942, and assumed office for another five-year term on May 18. The republic, aligning itself with the United States, declared a state of war with Japan December 8 and with Germany and Italy Dec. 11, 1941. For 1943 developments, see below.

History. No important news of political developments in the republic seeped through the censorship during 1943. The Dominican Government continued its cooperation with the United States and the United Nations, as was acknowledged by President Roosevelt in accepting the credentials of the first Dominican Ambassador to Washington early in May. (The diplomatic missions exchanged by the two countries were elevated from ministerial to applicate the property of the countries were elevated from ministerial to applicate the countries were elevated from the countries were elevated from the countrie

ambassadorial rank by mutual agreement.)

Economic conditions continued fairly satisfactory according to available reports. The agricultural expansion and diversification program inaugurated by the Trujillo dictatorship some ten years earlier bore fruit at an opportune time. It made the republic self-sufficient in foodstuffs at a time when Puerto Rico and other neighboring territories suffered severely from food shortages. The Dominican Republic was included in the drive for increased food production in the Caribbean area financed by the U.S. Board of Economic Warfare and Commodity Credit Corporation. During 1943 the Commodity Credit Corporation contracted for all surplus food produced in the Dominican Republic for shipment to Puerto Rico and other food-deficient areas.

Among the projects for increased food production completed during the year was a seven-mile irrigation canal near Las Matas de Farfan in the frontier province of Benefactor, designed to irrigate almost 30,000 acres near the Haitian border.

EARTHQUAKES. The usual number of earthquakes were reported during the year but practically none of them were of a destructive character. The most destructive, from the point of view of lives lost, was on June 20 in Turkey. Following foreshocks during the previous night and accompanied by torrential rain, a severe earthquake shook the beautiful, rich, fruit-growing district just to the east of the Gulf of Ismid, on either side of the Istanbul-Ankara Railway about sixty miles east of Istanbul. The epicenter of the shock was near the town of Adapazar, where most of the buildings were wholly or partly wrecked. Other towns more or less affected were Geyve, Arefie, and Hendek, the latter twenty miles east of Adapazar. Nearly all the villages in the district suffered. The shock was felt severely in Istanbul, where some apprehension was caused by walls collapsing. The Constantine Pillar in old Istanbul, dating from the fourth century, is reported to have been damaged. Adapazar is a town of about 20,000 population. About 2,000 were killed.

RICHMOND T. ZOCH.

ECONOMIC COOPERATION, Commission for. See Mexico under History.

ECONOMIC MOBILIZATION. See the topics listed under Manpower and War Mobilization.

ECONOMICS. See Business Review; Financial Review; Labor Conditions; Living Costs and Standards; Postwar Planning, etc. For books and research see Literature; Philanthropy. For economic conditions see countries under *History*.

ECONOMIC STABILIZATION, Office of (OES). The function of the Office of Economic Stabilization is to provide over-all direction and coordination for the

Government's program of stabilizing wages and living costs. The Director is assisted by a Board composed of the heads of agencies concerned with price and wage control and representatives of labor, management, and farmers appointed by the President. Because it is concerned primarily with policy making, the Office of Economic Stabilization operates with a very small staff.

The Office was established on Oct. 6, 1942, by Executive Order, with former Justice James E. Byrnes of the Supreme Court, as Director. On May 29, 1943, Mr. Byrnes resigned to become Director of the Office of War Mobilization, and Fred M. Vinson, who had been Associate Justice of the Federal Court of Appeals for the District of Columbia and Chief Judge of the Emergency Court of Appeals, was appointed to succeed him. See Business Review.

ECONOMIC WARFARE. See Great Britain under History; the article which follows.

ECONOMIC WARFARE, Office of (OEW). During the first six months of 1943, certain programs of the Government in the field of foreign economic operations were carried on by the Board of Economic Warfare. By Executive Order of July 15, 1943, the President created the Office of Economic Warfare and transferred to it the functions of the BEW. On Sept. 25, 1943, the President consolidated all Federal foreign economic operations by merging several agencies, including the OEW, into the Foreign Economic Administration (av)

Economic Administration (q.v.).

Until superseded by the Office of Economic Warfare in mid-July of 1943, the Board of Economic Warfare continued operations it had initiated in the preceding year on the foreign economic front. From foreign sources came increasing supplies of raw materials to keep domestic reservoirs above the danger line while, concurrently, the exercise of greater selectivity in exports to friendly nations was made necessary by critical shipping and supply situations. Meanwhile, behind-the-scenes preparations of offensive strategy called for careful documentation of enemy economic strengths and weaknesses, to aid in plotting blockade policy and to assist the military in selecting specific targets for offensive action. BEW policy was administered by three Offices—Imports, Exports, Economic Warfare Analysis.

Office of Imports. The United States took a bad initial blow in materials supply when Japan invaded the Far East. Lost to United States commerce almost overnight were 60 per cent of its normal tin supplies, 95 per cent of its quinine, 60 per cent of its hard fiber, valuable sources of fats and oils, practically all of its rubber, and, with the closing of the Burma Road, important sources of tungsten, hog bristles, silk, and other vital supplies. Relief resources were uncovered in other areas of the world and imported commodities—many of which were flown in to meet supply deadlines—stopped the drain on domestic stockpiles.

the drain on domestic stockpies.

Upwards of 100 purchase programs, involving many individual items from 40 different countries or areas, were directed by the Office of Imports in its around-the-world job of commodity procurement to keep the wheels of war industry turning. Minerals and metals, foodstuffs, textiles and fibers, and a long list of miscellaneous commodities were the principal goods imported. At the close of the fiscal year, June, 1943, the volume of development and procurement operations was running at an annual rate of around one-and-a-half billion dollars—the vast majority of which was handled through normal commercial import channels,

Office of Exports. Necessary wartime controls over shipments leaving the United States were directed by the Office of Exports. The controls, effectuated through a licensing system, were necessary to protect United States supplies of strategic materials, and at the same time to see that permitted exports went as far as possible in meeting the war-economy needs of friendly countries.

Export controls were applied to some 2,500 commodities and commodity groups, flowing from about 16,000 United States export concerns to more than 140 different country destinations and thousands of individual consignees—all of whom were screened against the "blacklist" of Axis suspects. The Exports Office examined export documents at the rate of two million annually—some 6,000 to 7,000 each business day. Commercial houses handled almost

100 per cent of the actual exportation.

Office of Economic Warfare Analysis. Accurate information about the industrial economy of all countries, particularly those under Axis domination, is vitally necessary for waging successful economic warfare. Picked up-a piece here, a bit there-and assembled in an action-index by the Office of Economic Warfare Analysis, such information is the foundation for basic strategy in economic offensives. Equally important, this information in mili-tary hands helps Army and Navy officials brief bomber crews for offensive action over enemy assembly plants, railway terminals, power plants, other strategic industrial arsenals.

Working closely with the British Ministry of Economic Warfare, analysts prepared measures for the guidance of blockade operations in neutral countries adjacent to the Axis. Commodity leaks to the enemy were thus plugged and, coincidentally, important information obtained for use by the Department of State in keeping its "blacklist" current. Further, the success of the secret job of preclusive buying—locking up materials in neutral countries to keep them from the Avis hinges levelled. to keep them from the Axis-hinges largely on the positive accuracy of analyses made of enemy

economies.

LEO T. CROWLEY.

ECUADOR. A republic of South America. Capital, Quito.

Area and Population. The boundary between Ecuador and Peru was in process of demarcation in 1943 in accordance with the settlement reached in 1942 (see 1943 YEAR BOOK, p. 203). The total area previously claimed by Ecuador was estimated at 276,007 square miles, including the Galapagos Islands (2,868 sq. mi.). The latest population estimate was 3,085,871 (Jan. I, 1942) (about 10 per cent whites, 39 per cent Indians, 41 per cent mixed, and 10 per cent Negroes and Orientals). Estimated populations of the chief cities: Quito, including rural areas 215,021. Convergit 190,000 including rural areas, 215,921; Guayaquil, 180,000;

Cuenca, 48,300; Ambato, 25,200.

Defense. As of Jan. 1, 1941, Ecuador had 8,313 men in the active army (including 272 in the air force) and 40,000 (estimated) trained reserves. There were a few small naval vessels. The defense budget for 1943 was 35,900,000 sucres (24 per cent of the total budget). United States naval and military aviation missions were engaged Dec. 12, 1940, for four-year terms. See *History*.

Education and Religion. Although primary education is nominally free and compulsory, the Indian and mixed races are largely illiterate. In 1940-41 there were 316,749 primary, 8,957 secondary, and 1,755 university students enrolled. Roman Catholicism is the dominant faith but there is no state religion.

Production. Agriculture supports some 90 per cent of the population. The chief crops, in order of importance, are: Cocoa beans, 294,764 quintals (of 101.4 lb.) in 1942; coffee, 258,000 quintals in 1941; rice, about 2,000,000 quintals in 1943; sugar, 12,320 short tons in 1942. Bananas, cotton, tobacco, corn, lentils, and other vegetables and fruits are grown. The important forest industries yield vegetable ivory and such strategic materials as rubber, balsa wood, cinchona bark, kapok, and tannin. Production of all the latter items expanded rapidly as a result of war demands. Latest livestock estimates: 2,500,000 cattle, 8,500,000 sheep and goats, 3,200,000 swine, and 1,200,000 horses. Gold, copper, and petroleum are the principal minerals. The petroleum output was 95,670,784 gal. in 1942 (65,882,249 in 1941). In 1941, 17,-000 kilos of gold-bearing cyanide precipitates, 13,-982,000 kilos of copper concentrates, and 120,000 metric tons of crude oil were exported. Straw hats, textiles, shoes, paper, leather, and cement are leading manufactures.

Foreign Trade. Imports in 1942 were equivalent to \$1,872,767 in United States currency; exports, \$2,059,933. In 1941, imports totaled 149,520,000 sucres; exports, 199,680,000 sucres. The United States supplied 73.8 per cent of the 1941 imports and purchased 73 per cent of the exports. Cocoa,

coffee, petroleum, gold, Panama hats, bananas, and rubber are the chief exports.

Finance. Estimates for 1943 balanced ordinary expenditures and receipts at 150,000,000 sucres (119,567,000 in 1942). Two special 1943 budgets aggregated 9,383,000 sucres. The actual budget surplus in 1942 was about 11,000,000 sucres. In 1941 actual revenues totaled 109,001,000 sucres; expenditures, 108,365,100 sucres. Public debt on Dec. 31, 1942: Internal, 36,235,928 sucres; external, \$29,473,738. The sucre (official rate) exchanged at an average of \$0.06667 in 1941 and \$0.06949 in 1942. A decree of July 13, 1943, fixed the buying rate for dollar exchange at 13.50 sucres to the dollar (instead of 13.70 to the dollar) while the selling rate remained stable at 14.10 sucres to the dollar. The circulating medium increased from an average of 155,249,422 sucres for 1987-39 to 387,484,683 sucres on Dec. 31, 1942.

Transportation. Ecuador in 1943 had 4,231 miles of highways (one-sixth paved). The Ecuador section of the Pan American Highway and other roads were under construction. There were over 775 miles of railway line. Both Quito and Guayaquil are linked with the inter-American air network.

Guayaquil is the principal port.

Government. The governmental situation has been confused since the coup d'état of 1925, when military rule was established. A new Constitution was promulgated in 1929 but continual friction between President and Congress provoked frequent revolutionary outbreaks and a succession of provisional governments, ruling largely by decree. On Sept. 27, 1935, the 1929 Constitution was annulled and the 1906 Constitution provisionally restored. A Constituent Assembly adopted a new Constitution Dec. 1, 1938, but the Congress elected on Jan. 15, 1939, promptly annulled it and the government restored the 1906 Constitution with certain reservations. President in 1943, Dr. Carlos A. Arroyo del Río (Liberal Radical), who assumed office Sept. 1, 1940. The Liberal Radical party won the elections to the Chamber of Deputies held May 11, 1941. The Cabinet as reorganized Aug. 20, 1941, was composed mainly of Liberal Radicals, with the Conservative and Socialist parties also represented. For 1943 developments, see below.

## HISTORY

Political Events. Despite growing political agitation inspired by the approach of a Presidential election in 1944, President Arroyo del Rio remained in control of both Government and Congress during 1943. During the regular session of Congress ended October 8, the extraordinary war powers conferred upon the President in 1941 were extended until August, 1944. Six aspirants were said to be seeking Presidential nominations, including former President José Maria Velasco Ibarra, who was forced out of office in 1935 when he attempted to assume dictatorial powers. A revolt by supporters of Velasco Ibarra among sailors of the Naval Hydrographic Service took place in the town of Puna on August 23, but collapsed when the townspeople failed to support it, according to the Ecuadoran Government. The rebellious sailors were arrested. A group of dissident Liberal Radicals campaigning for Congress was arrested in Ambato and Quito on February 20 and charged with political conspiracy.

Economic Conditions. The relatively stable political conditions prevailing during the year were attributed in part to an economic boom that developed in spite of the curtailment of shipping services and the scarcity of essential imports. The boom grew out of the wartime demand for balsa wood, rubber, cinchona bark, petroleum, and other strategic minerals and the economic stimulus provided by the establishment of a United States naval base at Salinas in 1942 and by the expenditure of United States funds and credits on various other Ecuadoran projects (see below). The difficulty of importing machinery and supplies from the United States forced the South American Development Co. to curtail its gold-mining operations at the beginning of June, forcing an estimated 25,000 men to transfer to more vital wartime occupations.

Heavy exports and curtailed imports caused gold and foreign exchange reserves to climb to record levels. However the improved exchange position of the sucre was accompanied by an unhealthy expansion of currency and a rapid rise in prices and living costs. After governmental price control measures had proved ineffective, the President in mid-1943 removed all limitations on imports, revised the dollar-sucre exchange rate (see Finance), and required the banks to invest at least 20 per cent of their deposits in 3 per cent gold certificates of the Central Bank. These anti-inflationary measures proved somewhat more effective than direct efforts to enforce price ceilings. As a result of the United States priority system and shipping difficulties, Argentina in April replaced the United States as the principal supplier of Ecuadoran imports.

U.S. Relations. Ecuador's close collaboration with the United States was furthered by the visit of Vice-President Henry Wallace to Ecuador in April and by extended United States financial, technical, and military aid.

The Ecuadoran Defense Minister and high army, navy, and air force officials made a four-day inspection of the U.S. Caribbean Defense Command late in May at the invitation of Lieut. Gen. George H. Brett. On June 4 two U.S. Coast Guard patrol vessels were turned over to the Ecuadoran navy under lend-lease in ceremonies at Guayaquil. United States naval and air forces remained on guard at Salinas and in the Galápagos Islands. At the request of the Quito authorities, the U.S. Government on September 13 agreed to detail an Army officer to serve as Technical Director of the Eloy Alfaro Military College of Ecuador.

In January the Ecuadoran Government announced that the \$1,150,000 credit it received from the Export-Import Bank of Washington on Oct. 28, 1940, would be increased by \$200,000. This additional sum was to be used in completing the Loja-Cuenca link of the Pan American Highway. The health and sanitation program undertaken with United States financial assistance and the cooperation of nearly a dozen United States and Ecuadoran agencies made marked progress. Among the 34 projects under development were a nursing school in Quito, new hospitals, laboratories, and sewage systems in Quito and Guayaquil, and sanitary campaigns at Salinas and in Chimborazo Province.

Substantial progress was reported also on the nationwide program of public works undertaken by the Ecuadoran Development Corporation with the large Export-Import Bank credit made available in 1942. The Corporation had three United States and three Ecuadoran directors. A United States technical mission aided the Development Corporation in carrying forward the broad program for the rehabilitation of El Oro Province, initiated in 1942 (for results, see John M. Clark, "Revival in El Oro," Foreign Commerce Weekly, Aug. 21, 1943). After a month's visit to Washington, the Minister of Public Welfare returned to Quito late in April with promises that the United States materials and equipment badly needed by Ecuadoran governmental agencies and the Guayaquil and Quito Railway would soon be delivered. In mid-1943 the U.S. Treasury extended for one year the \$5,000,000 currency-stabilization agreement reached with Ecuador on Feb. 27, 1942.

Other Events. The Ecuadoran Foreign Office in February protested to Peru against an alleged vio-lation of the newly established frontier by a pa-trol of 100 Peruvian soldiers. The protest was understood to have been due to a misunderstanding. By a decree of June 22, the President authorized the Minister of Finance to seize, administer, or transfer the businesses and properties of persons on the Allied blacklists and of nationals of countries to the countries of the service of th tries at war with any American nation. On December 25 all Axis nationals still residing in Ecuador were ordered to leave the country as soon as possible and several German and Italian nationals were held incommunicado.

See Spanish-American Literature; World War.

EDUCATION. Registration in high schools decreased in the autumn of 1943 by 5.7 per cent as compared with enrollments for the year 1942-43. This falling off of 351,000 pupils was undoubtedly due to the fact that opportunities for profitable employment were open to adolescents in much greater numbers than they had been for many years.

Just before schools opened in September the War Manpower Commission issued the following statement.

During the summer several million high school boys and girls have worked on farms, in factories, in stores, and offices. They have gained valuable work experience. They have helped to supplement family incomes. But most of all, they have felt that they were helping to serve their country.

Their experience has given them a keener sense of what life means. That sense they should not lose. But, at the same time, they must not lose sight of the fact that they have a mission in the future and that current work is not the whole answer either for themselves or for the nation.

Work is not the whole answer chart to the fighting and for the nation.

Students should realize that beyond the fighting and winning of this war, we must see that it stays won. That will be their obligation. That is the object of their education. In their hands is the ultimate fulfilment of the American ideals.

Communities and educators, on the other hand, must face the fact that there are real manpower shortages in many communities. They should recognize, too, that a distribution of the communities are the communities. many communities. They should recognize, too, that a community and educational program which does not provide opportunity for work will leave a real hiatus in the lives of many young people who keenly feel the issues of the present conflict. Intelligent action on the part of educators and community authorities can meet that dilemma successfully.

With the approach of a new school term, a plan of action should be developed which, at the same time, continues educational opportunities and permits student manpower to be used in the nation's interest.

The program in every community should be one which takes full account of the laws which govern the labor of children and the boys and girls of school age. There should be no lowering of the barriers which have been so wisely erected against the exploitation of children and youth.

In communities where many such youth are temporarily in the labor force, arrangements can usually be

and youth.

In communities where many such youth are temporarily in the labor force, arrangements can usually be worked out by which they may continue their employment on a part-time basis after they have returned to school this fall. School officials, employers, labor, civic leaders, and parents should plan together now to organize such work-school programs.

The Educational Policies Commission of the National Education Association issued a statement which must be described as nothing more than a qualified agreement with the position taken by the War Manpower Commission. A number of paragraphs may be quoted.

War Manpower Commission. A number of paragraphs may be quoted.

By the hundreds of thousands, boys and girls who in other times would have completed high schools, are now leaving school before graduation to go to work. In some communities, the exodus from high school has already reached proportions which are alarming to all concerned for the success of the war effort and for the long-time welfare of youth. In practally all communities, withdrawals have reached the point where they require immediate attention and action. And almost everywhere, the rates of withdrawal are steadily mounting.

At the same time, there are large sources of labor, especially of adults employed in the production of luxuries and in other non-essential occupations.

The greatest service which boys and girls of sixteen and seventeen can render to the war effort is to get ready for the national service which most of them will be called upon to give at eighteen, in the armed forces, in war production, in civilian war agencies, or in specialized training. Time after time, high officials of the Army and the Navy, of government and industry, have urged youth to use the years up to eighteen to build the foundations of a broad education. That way, they have affirmed, lies the greatest national service.

The greatest service which boys and girls of sixteen and seventeen can render to themselves is to secure now the education which will surely be needed in the highly competitive labor market of the postwar years.

Many cases have already been reported of successful arrangements for combining part-time work in war occupations with the continuation of regular schooling until high school graduation. Such cooperative plans offer the greatest promise of a constructive solution to the problem. All such arrangements, however, should be guided by the principle that both the national welfare and the welfare of youth require that education have first claim on the time and energies of youth.

While the reduction in enrollments in high schools is sufficiently

While the reduction in enrollments in high schools is sufficiently large to justify its recognition as a major social phenomenon, the fact is not to be overlooked that there are still more than five and a half million pupils in high schools. This is so large a percentage of the total adolescent population of the nation that it is clearly evident that education beyond the elementary-school level is recognized by the American people as essential to preparation for life. It is still true that the percentage of young people receiving secondary education in the United States is far and away greater than the corresponding percentage for any other country in the world.

The decline in registration in colleges is reported as 65 per cent for men and 5 per cent for women. These decreases were, of course, due mainly to the draft and expanding opportunities in in-dustry. The Army and Navy have taken over in whole or in part some 400 colleges for the conduct of military schools and are supervising directly instruction in regular college subjects of 300,000 se-

lected students who are in uniform. (For a list, see the Table of Universities and Colleges, where these institutions are indicated by asterisks or daggers.) These students are under full military discipline and are being paid by the government. They have been assigned to duty as students, many of them in the Specialized Training Program. This program provides courses in four divisions of college education: engineering, medicine, personnel psychology, and foreign languages. By far the largest number of students is in the engineering division. This program will ultimately register 150,000 students who belong to the Army. The quota was not filled rapidly during the early months of the year. The tests which were required of all candidates proved to be too severe for many of the applicants. In the later months, however, the number of candidates increased in number and quality to the point where approximately 10,000 were being accepted each month, enough to fill all replacements. The full quota will soon be reached. One hundred thousand candidates took the tests for admission in late November.

The curriculums prescribed by the Army and the Navy for their students in the various colleges are meeting with widespread approval by college authorities in spite of the fact that they differ markedly from the programs of study which were commonly elected in times of peace. It seems altogether probable that, when the war is over, college programs will continue to emphasize science, mastery of modern foreign languages, and other studies bearing directly on ordinary careers. There can be no doubt that in the field of high-

school education the postwar effects on the curriculum will be pronounced. The Army has organized a branch known as the Civilian Preinduction Training Branch, which is making every possible effort to induce high schools to prepare boys of sixteen and seventeen years of age in subjects which will contribute to their efficiency for military service when they reach eighteen years of age. Emphasis is laid on shop courses, but the Branch has published pamphlets containing suggestions formulated by committees of specialists in such fields as English, mathematics, and science. An examination of the recommendations made in these academic subjects shows that the courses of studies which were common before the war are recognized by high-school teachers as formal and in need of revision in the direction of enlivenment and more direct contribution to preparation of pupils for life.

It is especially noticeable that in the field of mathematics the committee which outlined the recommended courses departed from the conventional abstract courses in algebra and geometry and favored training in thinking quantitatively in all kinds

of practical situations.

The Preinduction Branch has not yet developed suggestions for instruction in the social studies. It is evident throughout the Army that a certain timidity prevails with regard to instruction in the social field. It is clearly recognized on the one hand that graduates of high schools and colleges are deficient in social understanding, but, on the other hand, the controversial character of many of the problems which have to be dealt with in this field stands in the way of attack by any agency which is in danger of laying itself open to the charge that it deals with politics.

A heated discussion was carried on throughout 1943 as a result of a series of articles published in The New York Times early in the year reporting the results of a test in American history administered to seven thousand freshmen in thirty-six colleges. A typical statement from the article published in the Times of April 4 is as follows:

An analysis of the results indicates that either the college freshmen, recently out of high school, were poorly prepared on the secondary level, or they had forgotten whatever they had learned about United States history. On many aspects of American growth and development they indicated a serious lack of knowledge or undertablished. they indi

standing.

Although it is likely that some of the students were not serious in answering the questions, it is evident, even after discounting that possibility, that the students simply do not know American history.

For example, 1,705 of the 7,000 students or 25 per cent, did not know that Abraham Lincoln was President of the United States during the Civil War. Twenty-five students listed George Washington as having been President during that highly important period in American life, Other men listed as having been President during the Civil War included Woodrow Wilson, Ulysses S. Grant, Theodore Roosevelt, William Tatt, Herbert Hoover, Andrew Jackson, or Warren G. Harding.

Teachers of history replied to the Times articles by charging that the test was inadequate, that it dealt largely with facts that called merely for memory rather than for understanding of historical trends. On the whole, however, the contention of the Times that American youth need more complete grounding in American history seems to have been proved. This conclusion is amply supported by the report of a commission of leading historians released late in December. The report states frankly that instruction in American history has been in-

adequate and incompetent.

Educational leaders are greatly disturbed by the fact that the supply of trained teachers has been seriously depleted. The draft has taken many men teachers, and lucrative employment has lured away both men and women. The statistics on teachers' salaries, showing them to be very low, have been presented with more effect than was possible formerly because of the striking contrast between these salaries and current wages and salaries in other fields. Congress was appealed to for a subvention to increase teachers' salaries in general and to give special help to States which find it impossible to keep schools open because of lack of candidates for teaching positions. Congress was told that the teaching force of the nation, which amounts to about one million, normally shows an annual turnover of 93,000. In 1943 the turnover was 189,000, and some schools, especially in rural areas, had to close because of the impossibility of securing anyone to fill vacancies. State certificating authorities and city school systems which have the right to certificate teachers without reference to State requirements have had to lower their standards. The larger school systems have in a number of cases resorted to the device of conducting special coaching classes in order to overcome the hazards to the school program that result from the employment of immature and unqualified teachers. The outlook for the future is dark because the enrollment in teachers' colleges is low and has been low for the past three years.

High hopes were entertained for a time by advocates of Congressional relief. A bill providing \$300,000,000 to be distributed to the States for bettering teachers salaries made more progress than subsidy bills for general education have ever been able to make in Congress. The bill even reached the floor of the Senate. At the last moment it was amended by the insertion of a provision requiring that any moneys received by a State from the Federal treasury must be expended in the same ratio for schools for all pupils—Negroes as well as whites. There seems to be ample justification for the belief that this amendment was

passed not by the friends of Negroes but by opponents of the bill. At all events, the amendment turned the representatives of the southern States, which would have been most largely benefited by the passage of the bill, against it, and the final action taken was reference of the bill back to committee. The Washington Post in a strong editorial stigmatized the action as political sabotage, as did also numerous educational journals.

Many efforts are being made to secure the adoption of plans for education after the war. By far the most significant and promising of these plans was that presented by President Roosevelt in a special message to Congress. The plan recommended by the President was prepared by a commended by the pr mittee which he had appointed to discuss the education of demobilized soldiers. Some paragraphs from the President's message are as follows:

We must replenish our supply of persons qualified to discharge the heavy responsibilities of the postwar world. We have taught our wouth how to wage war; we must also teach them how to live useful and happy lives in freedom, justice, and decency.

Specifically, I agree with the recommendations made by the committee in this regard as follows:

1. The Federal Government should make it financially feasible for every man and woman who has served honorably for a minimum period in the armed forces since Sept. 16, 1940, to spend up to one calendar year in a school, college, a technical institution or in actual training in industry, so that he can further his education, learn a trade, or acquire the necessary knowledge and skill for farming, commerce, manufacturing or other pursuits.

pursuits.

2. In addition, the Federal Government should make it financially possible for a limited number of ex-service men and women selected for their special aptitudes, to carry on their general, technical, or professional education for a further period of one, two, or three years. This assistance from Government should include not only cost of instruction but a certain amount of money for maintenance.

The appropriation indicated in the report of the committee as necessary to carry out the plan is one billion dollars. Up to date Congress has taken

no action. The President's committee was careful to leave to existing State and local institutions the actual administration of any funds appropriated. Nevertheless, the usual objection to Federal participation in any educational activities soon came to the surface in influential quarters. In a statement which would hardly have been necessary if the report of the committee had been carefully read the Board of Regents and others in New York State showed that they are oversensitive and afraid, as educators have repeatedly been in the past, of Federal interference. A report of the New York attitude is as follows:

A warning against permitting the Federal Government to exercise control over the education of returning servicemen and displaced industrial workers at the end of the war was voiced yesterday at a conference of State college and university presidents and the Board of Regents during which a broad program of postwar education in the State was discussed.

Dr. William J. Wallin, vice chancellor of the Board of Regents and chairman of its committee on postwar education, who presided at the closed meeting, explained when the discussion had been ended that Federal funds should be channeled through State agencies. "We don't want another NYA," he said.

"We want our own agencies to take care of educating men in the State instead of having it handled by a separate Federal agency," he added.

Other plans for postwar education were made by the International Education Assembly at a meeting of representatives of the United States and thirty other countries. The Assembly adopted a sixteen-point program, including provision for a permanent international committee to give assistance to all countries. A strong position was taken with regard to Nazi and Fascist educational systems. The action of the Assembly was reported thus: "It would be imperative that the victorious United Nations, in organizing an international society on democratic principles, eradicate those edu-

cational systems.

It was voted that local committees composed of known opponents of nazism, fascism, and Japanese militarism be set up in Axis lands to aid United Nations administrators in eliminating "all teachers and school administrators whose past records have been manifestly anti-democratic, and for the purpose of recruiting trustworthy substitutes.

The responsibility and operations of the United Nations representatives should decrease and those of the local and national administrators should increase "as rapidly as they demonstrate their capac-

ity to assume these burdens."

The Institute of International Exchanges and Scholarships announced its plans to intensify its activities and stated that Greece, Poland, Czechoslovakia, and Norway have already agreed to send students to America; one of these countries has indicated that it is fully prepared to send four hundred.

A new organization incorporated under the name Education for Freedom and composed of a number of prominent leaders published a statement that American education faces a crisis because of the low standards that are accepted in many parts of the country. Emphasis must be laid, the organization asserted, on the mastery of the three R's,

American history, grammar, and rhetoric.

Newsweek for October 18 contained an article from which the following paragraphs may be

quoted.

quoted.

In Panama City, Ministers of Education of the 21 American republics unanimously signed a ten-year agreement for the establishment of the world's first academic league of nations. The site was the unpretentious brownfront building of the National Institute—part of the University of Panama, where for the present the new project will be located.

Designed primarily for professional and graduate students, the Inter-American University, so its founders hope, will promote understanding among the Americas by offering courses of study in fields of special interest to this hemisphere. Subjects will include sanitary sciences, American folklore, anthropology, and history, comparative legislation and international law, social and economic sciences, mathematics, chemistry, physics, and biology. The university might help standardize degrees and credits among Latin American institutions and provide a laboratory for experiments in such problems as the teaching of English in Spanish and Portuguese-speaking countries, and vice versa.

Financial support for the Inter-American University will come from the 21 republics; funds will be donated by each country in proportion to its contribution to the Pan American Union (\$1.80 for each thousand inhabitants), and scholarships will be provided for each nation in proportion to the money contributed. The university, which will be tax exempt in all countries, will be administered by a commission composed of the heads of the American diplomatic missions to Panama, headed by Victor Florencio Goytia, Panama's Minister of Education.

New subjects of instruction and new methods of instruction are being developed. The experience of the Army in using visual aids in many branches of training is so satisfactory and its quick results through oral instruction from phonograph records in foreign languages are so convincing that it is confidently forecast that institutions will in the future follow the example of the Army.

Prime Minister Churchill gave great impetus to the movement to make English a universal language by his endorsement of Basic English, the 850 word English vocabulary, in these terms: "Here you have a very carefully wrought plan for an international language capable of very wide transactions of practical business and of international control of international co change of ideas . . . a medium of intercourse and

understanding to many races and an aid to the building up of our new structure for preserving peace." Mr. Churchill made his remarks on the oc-casion when Harvard conferred on him an honorary degree. He added to his own commendation that of President Roosevelt.

A unique contribution to the social studies has appeared in a volume prepared under the auspices of a committee of the legislature of New York State on the politically delicate subject of labor and industrial relations. The book is copyrighted in the name of the people of the State. It is designed to serve as a textbook in high schools and as informing reading for adults of all classes of society, especially employers and members of labor groups. It traces in an objective way the development of labor policies and movements throughout

the history of the United States.

It has long been apparent that the introduction into public schools of studies of labor relations is inhibited by the possibility of clashes between teachers and boards of education because disagreements are likely to arise on account of fundamental differences in views. The book now approved by a legislative committee may prove to be an example which will be followed by the publication of other authoritative books containing much-to-be-desired frank treatments of subjects which up to the present have been avoided in educational institutions because of their controversial char-

Statistical information is to be found in the articles on Schools (including pupil survival rates and education per capita) and Universities AND Colleges, and in the section on Education and Religion under the various countries. CHARLES H. JUDD.

EDUCATION, U.S. Office of. To the schools in wartime the U.S. Office of Education continued during 1943 to give effective leadership and direction as they sought to make their essential contributions to winning the war and the peace. In spite of teacher shortages, of the decimation of student enrollments in secondary schools and colleges, of financial stringencies, the education and training activities of American schools continued to add to the intelligence, resourcefulness, and adaptability of our fighting men, to the technical competence and skill of our workers and to the morale of our citizens. Through preinduction and postinduction training, through vocational training of war production workers, through war service activities, through the study of war problems and postwar plans, the schools and colleges with the assistance of the U.S. Office of Education, contributed their part to the growing might of America.

Vocational Training for War Workers. Financed by an appropriation of \$90,000,000 to the U.S. Office of Education, the States provided vocational training for more than 2,500,000 workers in war industries in 1943. Two types of courses were provided for men and women workers: 1. Preemployment courses in unit-skill jobs in war industries; 2. Courses supplementary to employment in war industries. Aviation, machine shop, ship and boatbuilding, and welding accounted for nearly threefourths of the enrollments. As the labor market tightened many trainees were paid by employers during their fulltime attendance in a vocational school to develop initial skills for a particular payroll job, the number of women trainees increased to approximately 40 per cent of total, and foremanship training was expanded to keep pace with the needs of management for supervisory training on the job. Agents of the U.S. Office of Education assisted at Army and Navy centers in training instructors and supervisory personnel, helped in the compilation of training manuals and in the organization of postinduction training programs. Advisory committees consisting of management and la-bor representatives aided State and local boards of education in the administration of the vocational training program for war production workers; helped to recruit trainees through the U.S. Em-ployment Service; and counseled concerning training needs and outcomes.

Rural War Production Training Program. During 1943 a total of 64,958 courses, enrolling 754,913 adult farmers, were provided under a \$15,000,000 appropriation from Congress administered by the U.S. Office of Education to the States. Repair, operation, and construction of farm machinery and equipment; production of milk, poultry, eggs, pork, equipment; production of milk, poultry, eggs, polk, beef, mutton, wool, soybeans, peanuts, sugar, hemp, fruits, vegetable seed; conservation and processing of foods for farm families were some of the subjects studied by classes meeting in farm shops, implement dealers' shops, vocational agriculture classrooms of rural high schools, community balls churches and farm homes.

nity halls, churches, and farm homes.

Engineering, Science and Management War Training. Of the total enrollment during the 1943 fiscal year of 509,000, about 422,000 were in courses planned to meet the shortage of engineers, 13,500 in courses for chemists, 11,750 in courses for physicists, and 122,750 in courses for production supervisors. The volume of college-level training, which had increased during 1942, reached its peak in 1943. Women constituted almost 25 per cent of the total enrollment. Members of minority groups in the nation's population were admitted to ESMWT classes whenever they could meet the academic prerequisites. Negro enrollment in particular rose slowly to about 1½ per cent of total in 1943. Although the percentage is small, the total number of Negroes enrolled has been substantial, reaching a cumulative total of more than 14,000 by June, 1943. Two factors seem to account for the small proportion of Negro enrollees. First, a relatively small proportion of the total number of Negroes are qualified and available for technical instruction of college grade; and, second, employment of Negroes in professional, technical, and subprofessional positions has presented complications which may have deterred their undertaking training. Not only did industry have a part in selecting courses and course content, but many men of expert technical knowledge, who were employed in industry, were engaged to teach ESMWT courses under the educational supervision of college faculty members. This program, operated as a section of the Division of Higher Education, was supported by an appropriation of \$25,-

High School Victory Corps. During 1943 the High

School Victory Corps program continued to channel to the schools of the nation recommendations of the Army, Navy, and other Governmental agencies and of major educational associations concerning adaptations in wartime secondary education. Publications were prepared to assist high schools to meet important wartime aims, such as guidance into critical services and occupations, wartime citizenship training, physical conditioning, and other preinduction training. Reports indicate that a large percentage of the nation's high schools adopted or adapted the recommendations of the High School Victory Corps program; that thousands of high schools organized student Victory Corps as a form of recognition for participation in service activities connected with the war, such as war bond drives, hospital aides, salvage campaigns, rationing registrations, and Victory gardens. The High School Victory Corps program suggestions, voluntarily accepted, constituted an effective chain of the intelligent cooperation assuring the nation of the intelligent assistance of 330,000 teachers and 6,500,000 highschool students in all phases of the war effort.

Visual Aids for War Training. During the fiscal year 1943 the U.S. Office of Education through its Division of Visual Aids for War Training, continued the development of visual aids specifically designed to assist instructors in expediting the training of war workers. One hundred-fifty visual aids units, each consisting of a sound motion picture, a silent film strip, and an accompanying instructor's manual were planned and put in production. Thirty of the units dealt with the shipbuilding skills, 25 with aircraft work, 49 with machine shop work, 20 with supervisory training, 10 with engineering, and 5 with maintenance of farm machinery. Distribution of completed films was handled through a commercial organization under contract through a commercial organization under contract awarded on a competitive bid basis. Twenty-eight thousand prints were sold to schools, industries, and the armed forces, both at home and abroad. Under appropriation for the fiscal year 1944, the Division is planning production of approximately 300 additional visual aids units, which when completed will make available to the schools a basic pleted will make available to the schools a basic and integrated series of visual materials for voca-

tional and engineering courses.

Special War Services. During 1943 the U.S. Office of Education cooperated with other Governmental agencies in a variety of special war services, including the development of recommendations having to do with the evacuation of civilians in case of air bombardment; the provision of extended school services to children of working mothers in war-congested areas; the certification of need for school facilities in war areas under the Lanham Act; the maintenance of essential school transportation in wartime; educational programs in war relocation centers; safeguards against exploitation of juvenile workers; school participation in war service activities such as salvage programs, rationing registrations, sale of war bonds and stamps. During the year three leaflets concerned with postwar educational planning were issued. Through specific programs emphasis was given to understanding the Far East and the South American Republics. Intercultural education, Negro education, rural education, and the education of exceptional children were reported in studies developed by specialists in these fields.

Statistics. The basic statistical data concerning education in the United States continued to be collected and compiled by the U.S. Office of Education during 1943, together with special studies undertaken to meet requests for data from other Government agencies and the general public. Data included studies of the effect of the war on school enrollments, on school building needs, on landgrant colleges, on Negro education, on college income and expenditures, and on expenditures per pupil in city-school systems. See Schools; Univer-

Information Exchange on Education in Wartime. The Information Exchange on Education in Wartime, a unit in the Office of Education Library, continued the development and circulation of packets of loan material on 75 different special topics, such as Inter-American friendship, nutrition, the Far East, health, and the role of the schools in war-time. Thousands of packets were loaned to teachers in rural and village schools having inadequate

library facilities.

Inter-American Educational Relations. Activities of the Division of Inter-American Educational Relations, established in 1942, continued during the 1943 fiscal year with regular appropriations and other funds received through the Office of the Coordinator of Inter-American Affairs. Some of these activities include the exchange of graduate students under the Buenos Aires convention, promotion of the study of Spanish and Portuguese, an exchange of teachers between the United States and other American Republics, promotion of the organization of Pan-American Clubs in the schools, the development of exhibits and informational loan packets on the other American Republics for use in schools, and Inter-American Demonstration Centers in more than 30 schools and colleges. See also Education.

Adult and Civic Education. The Division of Adult and Civic Education of the Office of Education, which had been active in the development of Key Centers of War Information in 144 of the nation's colleges and universities, was discontinued as of

June 30, 1943, for lack of appropriation.

Higher Education. During 1943 the Division of Higher Education assisted colleges and universities in making adjustments to meet wartime demands. Special reports were made of recommended adjustments of the content of the college curriculum to wartime needs. Studies of teacher shortages and other personnel problems in colleges were published and proposals were made to the Congress for civilian training programs in and through the

colleges.

Student War Loans. During the fiscal year 1943 the Division of Higher Education administered a \$5,000,000 appropriation for loans to students in certain special and technical fields considered essential to the war effort. The primary purpose of these loans was to facilitate the acceleration of programs of professional preparation of students in essential categories, i.e., engineering, physics, chemistry, medicine (including veterinary), dentistry, and pharmacy. More than 11,000 students in several hundred institutions received loans totaling approximately \$3,000,000. Loans averaged \$265 per student. Because of the rapidly changing wartime conditions which were affecting higher educational institutions at the end of the fiscal year 1943, the Congress felt justified in providing for only a limited continuation of the Student War Loans program during the fiscal year 1944. The unexpended 1943 balance was reappropriated with the provision that loans should be available only to those students who had received loans during the fiscal year 1943.

Vocational Education. The Vocational Education

Division of the Office continued in 1943 to administer the provisions of the Smith-Hughes and

George-Deen Acts for the promotion of vocational education in the States in the fields of agriculture, trades and industry, home economics, business, and public service occupations. The attrition of teaching staffs in vocational education continued

to present grave problems.

More than 1,000 departments of vocational agriculture in rural high schools were closed for lack of qualified teachers. The 8,000 vocational agriculture teachers who remained in service contributed to the increased production of vital farm commodities through courses in the planning, production, harvesting, processing, distributing, and storing of farm commodities, the maintenance and repair of farm implements and machines, and the training of emergency farm workers. To these teachers through the Agriculture Education Service of the Office of Education, which operated the Rural War Production Training Program, and State boards for vocational education, services were rendered by publications, conferences, and institutes.

The Business Education Service of the Vocational Division of the U.S. Office of Education continued to provide assistance to the States in the promotion and development of a Federally-aided program of distributive education, including programs of training designed to help retail businesses meet problems and conditions with which they are confronted as a result of wartime emergencies. Such programs included wartime emergency replacement training for new store workers, for inexperienced sales persons, for store supervisors and department heads, for owners and managers of dis-tributive businesses. The Business Education Service rendered advisory services to schools in connection with the adjustment of their officetraining programs to meet wartime needs, and in the development of preinduction training for Army clerical employment.

Both regional and special agents of the Home Economics Service of the Vocational Division continued in 1943 to assist teacher-training institutions, State supervisors, city supervisors, and teachers in adapting their curriculums to wartime needs. Special emphasis was given to nutrition education, consumer education, home care of the sick, training youth for wartime service, food conservation,

and community organization.

The Occupational Information and Guidance Service of the Vocational Division assembled and disseminated pertinent information through State supervisors and local school authorities concerning military and civilian occupations in wartime. It prepared bibliographies and outlines for the use of guidance counselors in the schools; participated in vocational conferences conducted by schools, colleges, and community organizations, and assisted other agencies and individuals engaged in the preparation of occupational information for use in vocational guidance programs in the schools. In cooperation with the War Department and other Governmental agencies, it developed an "Educational Experience Summary Record" which is being widely used to provide young people leaving school with specific evidence of their abilities, interests, scholastic and work experience, to present to prospective employers or classification officers in the armed forces. It worked with the National Selective Service system (q.v.) in the development of a plan for securing reports on personality traits of the young men facing induction, which reports would be helpful to medical officers in the induction centers. It cooperated with private and Governmental organizations in a program for the recruitment of trainees for professional nursing.

The Trade and Industrial Education Service of the Vocational Division, in addition to operating the program of Vocational Training for War Workers, continued to serve States and local communities in the development of trade-preparatory programs for both boys and girls. It carried forward studies in the development of area trade schools, of apprentice training, of new wartime occupations, of supervision and teacher training, and of public service training.

Vocational Rehabilitation. The expansion of war industries, coupled with a shortage of manpower in several States, provided enlarged employment op-portunities for the physically handicapped during 1943. The national program of civilian vocational rehabilitation, operating through State boards for vocational education, reported nearly twice the number of rehabilitants in 1943 as in the preceding year. The Services of the Division included the location, interviewing, and counseling of physically handicapped persons; the development of shorter and more intensified training courses; and the se-lection and placement of disabled persons in war industries. In the summer of 1943, the Vocational Rehabilitation Division was made an Office of Vocational Rehabilitation in the Federal Security Agency with its director responsible to the Administrator. It will continue to work through State boards for vocational education.

The Service for the Blind continued its special activities in connection with the development of vending stands for blind persons in Federal build-

ings.

Information and Radio Services. U.S. Office of Education mailing lists, totaling more than 200,000 names, were used by war agencies 81 times during the fiscal year 1943. Wartime information distrib-uted to schools, colleges, and libraries and other educational institutions by the Office of Education totaled 1,380,000 pieces, including in this total the biweekly publication, *Education for Victory*, sent free to some 65,000 educational institutions and administrators.

Twenty-four general educational exhibits were prepared and routed to 'educational institutions and gatherings. A Radio Transcription and Script Exchange circulated hundreds of titles to more than 5,000 schools. In 1943 the Federal Radio Education Committee of the U.S. Office of Education undertook the development of a new monthly radio program-listing service to schools. It continued to send to schools through its Service Bulletin information about existing wartime radio programs and otherwise continued its function of cooperative study by broadcasters and educators of methods by which radio may be used most effectively as an educational medium. For day care and physical fitness programs, see Federal Security Agency.

J. W. Studebaker.

EGYPT. A kingdom of northeastern Africa. Capital, Cairo. Ruler in 1943, Farouk I, who succeeded to

the throne Apr. 28, 1936.

Area and Population. Excluding the Anglo-Egyptian Sudan (q.v.), Egypt has an area of about 386,000 square miles of which only about 13,600 square miles along the Nile are occupied. The estimated population on Jan. 1, 1940, was 16,680,000. Populations of the chief cities at the 1937 census were: Cairo, 1,307,422; Alexandria, 682,-101; Port Said, 126,907; Tanta, 94,421; Mansûra, 68,637; Asyût, 59,925; Damanhûr, 61,791.

Education and Religion. About 88 per cent of the adult inhabitants were illiterate at the 1927 census. There are two types of education, one provided by

the native primary schools (maktabs) which are mainly concerned with the teachings of the Mohammedan religion, and the other modeled on the European system. European-type education is provided by Government schools and by schools maintained by Christian missionary societies and other religious faiths. All schools are under the general supervision of the Minister of Education. The Government devotes about 11 per cent of its budget to education. It maintains primary, secondary, and technical schools; teachers colleges; and colleges of agriculture, veterinary sciences, law, engineering, and medicine. There is a State University at Cairo, with over 7,500 students in 1939-40. Excluding nomads, the religious division of the 1937 census population was: Moslems, 14,-552,704; Copts and Greek Orthodox, 1,099,186; Protestants, 78,203; Latins and Uniats, 126,581; Jews, 62,953.

Production. More than 60 per cent of the inhabitants are engaged in agriculture. War conditions forced the Government to curtail cotton production (the main crop) and increase the output of food crops. The 1942 cotton crop was 3,103,847 kantars (1 kantar = 99 lb.), as against 8,204,386 kantars in 1941. Yields of the chief food crops showed increases as follows: Rice, 863,118 metric showed includes a follows: lite, 905,118 inethic tons in 1942 (665,758 in 1941); wheat, 1,261,650 metric tons in 1942 (1,123,800 in 1941); barley, 15,562,000 bu. in 1943 (12,710,000 in 1942); chickpeas, 26,791,000 lb. in 1942–43 (15,876,000 in 1941–42); beans, 626,123,000 lb. in 1942–43 (611,427,000 in 1941–42); onions, 238,590,000 lb. in 1942–43 (222,156,000 in 1941–42); flaxseed, 17,485,000 lb. in 1942–43; millet, 47,991,680 bu. in 1942; com, 62,113,920 bu. in 1942. Citrus fruits, peanuts, sesame, and sugarcane are other crops. Mineral production in 1940 (metric tons): Phosphate rock, 183,464; petroleum, 928,957; manganese ore, 64,912. The catch of sea and lake fisheries in 1940 was 30,558 metric tons; Nile fisheries, 3,904 tons. Some industrial development occurred during World War II with the aid of the Middle East Supply Center.

Foreign Trade. Imports in 1940 totaled £E31,-377,815 (£E34,090,923 in 1939); exports, £E27,-811,431 (£E34,080,706 in 1939). Chief sources of 1940 imports: United Kingdom, £E8,901,050; United States, £E3,594,673; Chile, £E2,350,088. Exports went mainly to: United Kingdom, ££10,-378,504; France, ££4,353,188; India and Burma, £E1,776,431; Japan, £E1,565,073. Raw cotton exports in 1940 were valued at £E18,858,646 (£E24,330,364 in 1939).

Finance. Including the railway budget, receipts and expenditures for the fiscal year beginning May 1, 1943, were estimated to balance at £E65,-000,000 (£E53,526,000 in 1942-43). Public debt on May 1, 1941, £93,363,680 sterling (consolidated, £87,231,540; Egyptian tribute loans, £6,-132,140). Average exchange rate of the Egyptian pound (£E): \$4.135 in 1941, \$4.138 in 1942.

Transportation. Egypt in 1943 had about 3,550 miles of state-owned railway lines and sidings and 880 miles of privately-owned light farm railways.
During 1942 a swing railway bridge was built across the Suez Canal to eliminate the car ferry on the Cairo-Haifa-Beirut railway line. The bridge connected with the new railway line from Kantara to the Suez roads along the east side of the canal. Highways extended 6,838 miles. The Egyptian Government in 1943 agreed to widen and improve the coastal road from Alexandria to Mersa Matruh. British military authorities undertook to improve the road from Mersa Matruh westward across

Libya to Tunisia. Cairo is the hub of British air communications in the Middle East, with lines radiating to South and West Africa, Palestine, Baghdad, and India. A route for ferrying warplanes and supplies to Egypt from the United States via Brazil, West African ports and Khartoum was opened in 1941. Excluding warships and vessels requisitioned for military service, 8,918 steamers of 30,492,332 tons entered Egyptian ports during 1939 (3,896 steamers of 11,014,013 tons in 1940). Alexandria, Port Said, and Port Suez were the leading ports. See Suez Canal.

Government. The Constitution of Apr. 19, 1923, provided for a Parliament of two houses—a Senate with 147 members serving 10-year terms, two-fifths nominated by the crown and three-fifths elected by universal male suffrage, and a Chamber of Deputies with 264 members elected for five years. The Council of Ministers is appointed by the King but is responsible to Parliament. In the elections of Mar. 23, 1942, the Wafd (Nationalist party) won 108 out of 147 seats in the Senate and 216 out of 264 seats in the Chamber. The two strongest opposition parties boycotted the polls. The Wafd leader, Mustapha Nahas Pasha, formed a Wafdist Government on Feb. 5, 1942, which he reorganized May 26. The following July, the Wafd expelled 15 Deputies and 4 Senators, who joined the opposition. For developments in 1943, see below.

## HISTORY

Foreign Relations. The success of the British Eighth Army in driving Axis forces out of Egypt and Libya late in 1942 was followed by a marked relaxation of political tension in Egypt in 1943. On June 5 Bedouin tribesmen of Egypt and Libya celebrated the Allied victory in North Africa at a great assemblage attended by British, American, Indian, and Egyptian political and military leaders. The Bedouin chief, Abballah Lamloum Pasha, thanked the Allies for delivering the Arab tribes of North Africa from the Nazi-Fascist yoke. The blackout in Cairo was ended in August. At the opening of the three-day Wafd party congress at Cairo on November 14, Premier Mustapha Nahas Pasha announced the Egyptian Government's decision to adhere to the terms of the Atlantic Declaration or Charter (see 1942 Year Book, p. 46) and to open negotiations for Egypt's inclusion among the United Nations. "Independent Egypt," said Nahas Pasha, "stands firm with the democracies, the countries that respect the rights of mankind."

The Egyptian Government on March 2 signed an agreement with the United States covering the status of American troops in Egypt. Under the provisions of this agreement, the U.S. Ninth Air Force based in Egypt opened one of the largest military airports in the world near Cairo on October 25. Following talks in Cairo between Nahas Pasha and Ivan M. Maisky, Russian Assistant Commissar for Foreign Affairs, diplomatic relations between Egypt and the U.S.S.R. were established on August 26 for the first time since the Bolshevist revolution. On September 26 Premier Nahas granted the Soviet Covernment permission to use radio transmitters of the Egyptian State broadcasting system for the dissemination of Soviet news and propaganda. President Roosevelt, Prime Minister Churchill, and Generalissimo Chiang Kai-shek assembled at the Mena House, a luxury hotel five miles outside of Cairo, on November 22–25 for the historic conference that coordinated Allied strategy against Japan (see United Nations).

Arab Federation. Nahas Pasha assumed the centrol role in the negotiations for federation of the

Arab states that followed the British Foreign Minister's renewed endorsement of the idea in March. On March 31 Nahas announced that he planned to discuss the matter with the governments of the Arab countries separately. If they appeared to be in agreement on basic problems of federation, the Egyptian Government would then invite delegates from the various Arab countries to a conference in Egypt to consider the form and method of federation.

In accordance with this program, Nahas held lengthy conversations in Cairo with Premier Nuri es-Said of Iraq early in August, with Premier Tewfik el Hada of Trans-Jordan in September, and with Sheik Youssef Yassin, special envoy of King Ibn Saud of Saudi Arabia, and a delegation from Syria in October and November. The major obstacles to the proposed federation dealt with in these discussions were the British mandate over Palestine, the Zionist campaign for an independent Jewish national state in Palestine; and the delay of the French administration in Syria and Lebanon in fulfilling its pledge of Syrian-Lebanese independence.

A difference of opinion reportedly developed between the Egyptian and Saudi Arabian conferees over the question of Palestine. King Ibn Saud favored an immediate attempt at settlement of the thorny Arab-Jewish problem, while Nahas Pasha was said to have urged postponement of this question until after the war. While the Syrian delegation was in Cairo a crisis developed in the Lebanese Republic in mid-November as a result of the French action in dissolving Parliament and ousting the native nationalist government. This provoked anti-French demonstrations by throngs of Egyptian youths in Cairo. Nahas Pasha in a series of statements condemned the action of the French authorities and demanded the restoration to office of the Lebanese President and Premier. His attitude reflected that of the other Arab lands.

After the settlement of the Lebanese-French controversy by Gen. Georges Catroux, Nahas Pasha on December 28 sent the latter congratulations. On the same date it was revealed that the Syrian Foreign Minister, Jamil Mardam, and other high Arab officials were en route to Iraq and then Saudi Arabia for further conferences on Arab federation prior to the convening of a general Arab congress in Cairo early in 1944. One purpose of Jamil Mardam's scheduled visit to Saudi Arabia was to straighten out the differences that had arisen between King Ibn Saud and Nahas Pasha.

Internal Politics. The year's main development in the field of internal politics was an outgrowth of the 1942 quarrel between Nahas Pasha and his Minister of Finance, Makram Ebeid Pasha, which resulted in the dropping of Makram Pasha from the Cabinet and his expulsion, along with a group of his followers, from the Wafd party (see 1943 Year Book, p. 212). In a petition addressed to King Fuad, Makram Pasha accused the Premier and members of his Government of using their official positions to enrich themselves, their families, and friends. The petition, referred to as the "black book," was widely circulated by political enemies of the Premier. Some students joined with opposition politicians in attacking the Government. Nahas Pasha met this threat to his political power during a five-day debate in the Chamber of Deputies late in May, refuting the charges one by one. The debate ended May 24 when the overwhelmingly Wafdist Chamber passed a vote of confidence in the Premier by I60 to 0, after opposition members had walked out of the session.

Economic Measures. Large expenditures by Allied troops and Allied governments created an active war boom in Egypt. While many Egyptians experienced unusual prosperity, others suffered from the rapid inflation of prices that accompanied the boom. The Government took various measures designed to curb the rising cost of living. Rents, which had quadrupled in Cairo, were legally restricted to a level not more than 12 per cent above that prevailing Apr. 1, 1941.

Other methods adopted were requisitioning, price-fixing, distribution of staple commodities by the state, creation of cooperative societies, and subsidization of the production of more foodstuffs. Commercial and industrial firms were required to pay their employees a cost-of-living allowance equal to that paid to Government servants. In a drive against hoarders and profiteers, the Government in May and June requisitioned hoarded goods in warehouses and shops in Alexandria and Cairo

valued at over £2,000,000.

Partly for the purpose of impounding excess purchasing power, the Government in February floated a £ E2,000,000 loan for the financing of the 1942— 43 cotton crop. In November it announced plans for the refunding at lower interest rates and nationalization of the Egyptian public debt. A decree of September 15 established maximum percentages of profit for commercial transactions, effective September 25. The Government also continued its cooperation with the Middle East Supply Center (which see) in stabilizing and improving economic conditions.

War.

EHFA. See ELECTRIC HOME AND FARM AUTHORITY. EIB. See EXPORT-IMPORT BANK.

EIRE (IRELAND). A sovereign, independent state, affiliated for certain purposes with the British Commonwealth of Nations; comprising the 26 counties of Southern Ireland formerly designated the Irish Free State. The name was officially changed to "Ireland" in English and to "Eire" in Gaelic by the Constitution effective Dec. 29, 1937.

Area and Population. The area is 26,601 square

miles and the population was 2,989,700 (1,512,-170 males and 1,477,530 females) at the census of November, 1941, as compared with 2,965,854 at the 1936 census. Populations of the chief cities at the 1950 census. Populations of the effect effects in 1941: Dublin, 489,276; Cork, 76,758; Limerick, 42,522; Waterford, 28,481. Living births in 1941 numbered 56,710 (56,594 in 1940); deaths, 43,823 (41,885). A total of 31,800 men and 3,272 women emigrated from Eire to Great Britain during 1941 and 31,775 men and about 11,000 women during the first nine months of 1942

Defense. See 1943 YEAR BOOK and History below. Education and Religion. School attendance is compulsory and there is practically no illiteracy. Gaelic is gradually supplanting English as the language of instruction. There are about 5,114 public elementary schools, with an average attendance of 464,108; 852 recognized private secondary schools, with 38,713 pupils; and two universities--the University of Dublin (Trinity College), and the National University of Ireland with constituent colleges in Dublin, Galway, and Cork—with a total of 5,431 students in 1941–42. Estimated state expenditures on education in 1942-43 (excluding administration): Primary, £3,808,837; secondary, £492,990; technical, £336,085; science and art, £47,173. According to the 1936 religious census, there were 2,773,920 Roman Catholics, 145,030

Protestant Episcopalians, 28,067 Presbyterians, 9,649 Methodists, 3,749 Jews, 715 Baptists, and 7,290 others.

Production. Agriculture, stock raising, manufacturing, and fishing are the chief occupations. Yields of the chief crops in 1942, with 1941 totals in parentheses, were (in long tons): Wheat, 511,518 (435,414); oats, 768,045 (684,426); barley, 172,-274 (142,924); potatoes, 3,120,307 (3,689,548); turnips, 2,100,156 (2,631,548); mangels, 1,386,-240 (1,760,217); sugar beets, 399,146 (719,533); cabbage, 188,135 (205,021). The 1942 wheat crop was the largest since 1846. Flay production, 5,584. was the largest since 1846. Flax production, 5,584,-000 lb. in 1942 (6,041,000 in 1941). The 1941 hay crop was 4,224,319 tons. Livestock in 1942 included 4,100,000 cattle, 2,700,000 sheep, 518,700 swine, and, in 1940, 458,580 horses. Sea fisheries in 1941 employed 8,865 persons; the total value of the catch, excluding salmon, was £548,-503. The chief manufactured products are flour and flour products, sugar, sugar confectionery, jams, tobacco products, and alcoholic beverages. The Shannon hydroelectric power station in 1941–42 generated 240,336,000 kilowatt-hours, slightly more than half of the country's power needs.

Foreign Trade. General imports in 1942 amounted to £34,692,000 (£29,532,000 in 1941); exports, £32,616,000 (£31,836,000 in 1941). Great Britain was the chief market and source of supply.

Finance. For the fiscal year ended Mar. 31, 1943, Government receipts totaled £39,728,000 (£36,-680,000 in 1941–42); expenditures, £43,046,000 (£40,625,000 in 1941–42). The balance in the Exchequer was £1,180,000 on Mar. 31, 1943, and £2,394,000 on Apr. 1, 1942. Revenue for 1943–44 was estimated at £41,582,000; expenditure, 44.337,000. Public debt, £34,628,000 on Mar. 31, 1941. The Irish pound, which is convertible into the pound sterling, exchanged at an average of \$4.032 in 1941 and 1942 on the free market.

Transportation. Eire in 1942 had about 2,493 miles of first-line railway track, 5,358 miles of roads used by motor vehicles, 650 miles of inland waterways, and air connections with Great Britain and (in summer) with Canada and the United States. During 1939 a total of 11,903 vessels of 8,272,568 registered tons entered the ports.

Government. Under the Constitution proclaimed Dec. 29, 1937, there is a President elected by popular vote for seven years. The Oireachtas (Parliament) includes two houses: the Dail Eireann or House of Representatives of 138 members elected by popular suffrage for five years, and the Senate of 60 members (43 elected on a vocational basis, 6 elected directly to represent the two universities, and 11 nominated by the Prime Minister). Executive power is exercised by the Government, or Cabinet, which is responsible to the Dail. For further particulars, see 1937 YEAR BOOK. President in 1943, Dr. Douglas Hyde (assumed office June 25, 1938). Prime Minister, Eamon de Valera, leader of the Fianna Fáil party, who was elected by the Dail Eireann on June 30, 1938. For 1943 developments, see below.

## HISTORY

The General Election. The Dail Eireann elected in 1938 adjourned on May 26, 1943, but by special provision remained nominally in existence until a new Dail was elected on June 22. During the electoral campaign, Prime Minister Eamon de Valera's Fianna Fáil (Republican) Government was attacked for its failure to curb soaring living costs, its alleged mismanagement of agriculture, and its inability to end the unemployment which had driven many persons to emigrate to Great Britain and Northern Ireland. The opposition United Ireland (Fine Gael) party, led by former Prime Minister William T. Cosgrave, demanded the formation of an all-party coalition government to deal with Eire's difficult war and postwar problems. De Valera strongly opposed such a coalition. All of the rival political groups were in accord on the Government's policies of strict neutrality, effective independence from Britain, and the union of Eire and Northern Ireland.

The results of the election showed growing dissatisfaction with the economic policies and programs of both major parties. De Valera's Fianna Fáil lost its majority in the Dail, largely due to the unexpected gains of the Labor party led by William Norton, while a new Farmers party headed by Michael Donnellan cut deeply into the strength of Cosgrave's United Ireland party. The standings of the parties in the new Dail, with their standings after the 1938 elections in parentheses, were: Fianna Fáil, 67 (77); United Ireland party, 32 (45); Labor, 17 (10); Farmers, 14 (1); Independents, 8 (6).

It was noted that while all of Prime Minister de Valera's Cabinet Ministers were reelected by substantial majorities, a number of Cosgrave's leading associates were defeated. Among those elected was James Dillon, who ran as an Independent candidate from a border district after having been forced to resign from the United Ireland party because of his demand for the scrapping of neutrality in favor of cooperation with the United States and Britain. The Labor party's more important role in Eire's affairs was again emphasized on June 28 when Martin O'Sullivan, Laborite, was unanimously elected Mayor of Dublin. He was the first member of the party to hold that office.

De Valera Retains Office. When the newly elected Dail convened on July 1, the three opposition parties proved unable to form a coalition to unseat the Fianna Fáil Government. De Valera was reelected Prime Minister over Cosgrave by a vote of 67 to 37, with 33 members (14 Farmers, 17 La-borites, and 2 Independents) abstaining. The Farmers party, however, indicated its willingness to keep the de Valera Government in power as long as it followed a policy acceptable to agriculture. The Prime Minister accordingly continued to govern with only a slight reshuffling of his Cabinet and with inconsequential changes in policy. However the loss of the Fianna Fáil working majority and his dependence upon the Farmers plainly galled Prime Minister de Valera. On July 2 he hinted strongly that he would soon dissolve Parliament and seek to regain a parliamentary majority in another general election. But no such move had been made up to the end of the year.

Other Internal Events. Meanwhile de Valera pressed forward with his program of Irish national resurgence. On St. Patrick's Day, which witnessed none of the customary festivities, parades, and rallies, he declared that "restoration of the unity of national territory and restoration of a national language are the greatest of our uncompleted national tasks." On May 9 he attacked the partition of Ireland as a permanent obstacle to Anglo-Irish cooperation and understanding, a theme which had again been reiterated by Joseph Cardinal Mac-Rory, Roman Catholic Primate of Ireland, in a speech on April 4. At Waterford on June 16 de Valera announced plans for establishing a popular organization for the complete restoration of Irish as the national language. He described the English language in Eire as a badge of conquest.

The underground Irish Republican Army remained relatively quiescent during 1943, apparently due to the stringent measures of repression taken by the Government. A severe censorship prevented news of adverse internal developments from being published abroad. But the Government continued to exercise firmly the broad powers for the repression of terrorism conferred upon it by the Emergency Powers Act and Offenses Against the State Act of 1940 (see 1941 Year Book, p. 366). Three I.R.A. internees at the Curragh Camp went on a 49-day hunger strike in mid-summer without obtaining their release. Addressing the Dail on July 9, Minister of Justice Boland said that a German parachutist who landed in Eire in 1940, apparently with plans for invasion, was harbored by the I.R.A. for 18 months.

In the economic field, the principal developments were the growing shortages of staple com-modities of all kinds, accompanied by high unemployment and steadily rising living costs. The number of unemployed agricultural and industrial workers was about 88,000 in January and 50,000 at the height of the farming season in July. cost of living index (Base: January-June, 1939 = 100) increased from 119 in 1940 to 131 in 1941, 144 in 1942, and 159 in May, 1943. The rationing of electricity was introduced Apr. 1, 1943, and of butter on June 5. This was accompanied by more rigid rationing of tea, gasoline, clothing, etc., and

the fixing of clothing prices.

An acute shortage of potatoes developed in Dublin late in April. Other foodstuffs remained scarce. Nevertheless the Government in the autumn announced that the total acreage planted to all crops in 1943 was less than in 1942 and that unfavorable weather conditions had further reduced the harvest. The new government-owned Central Bank opened its doors in Dublin on Febru-

Foreign Relations. The Irish ship Irish Oak, with plain neutral markings, was sunk by a submarine in the North Atlantic in daylight during May. Prime Minister de Valera described the sinking as wanton and inexcusable. However the Axis diplomatic and consular representatives remained in Dublin. The Japanese Consulate was raised to the status of a Consulate General the same month.

Attacks upon Eire's neutrality policy continued to appear in both the British and American press (see particularly Henry Steele Commager, "A Challenge to Ireland's Neutrality," The New York Times Magazine, Mar. 7, 1943). On July 22, the British Home Secretary, Herbert Morrison, publicly declared that Britain would not forget Eire's neutral policy and that it was bound to have a modifying effect on British opinion with respect to Irish partition. Writing in the Foreign Policy Bulletin for July 2, John Elliot in his Washington News Letter summarized the consequences of Eire's neutrality policy as follows: "The cleavage be-tween the two sections of the Irish people has been deepened, a large part of the sympathy that de Valera and his party enjoyed in the United States has been forfeited, and 'partition,' if no made permanent, may have been indefinitely extended.

Apparently these developments made little impression in Éire. The Dublin Corporation on September 6 unanimously petitioned the Governmen to replace the Queen Victoria statue in front o Parliament House in Dublin with a statue of Lorc Edward Fitzgerald, a rebel hero of Napoleonic times. On September 11 the Eire censorship bannec the London Sunday Dispatch, which had a circulation of some 70,000 in Eire, because it published two articles attacking Eire's neutrality and the de Valera administration. Speaking in the Dail on November 16 de Valera declared that Eire had never forgotten the generosity of the United States, but could not be expected to show her gratitude "in the blood of her people." Regardless of possible attempts to penalize Eire after the war, he said, the country must stand by its neutrality policy to the end. At the end of December the Irish ship Kerlogue landed at Queenstown (Cobh) 164 German survivors of a naval and air battle in the Bay of Biscay who had been picked up at sea. See Chemistry under Foreign.

ELECTIONS. For State Elections, see the article which follows. For National Elections (1944), see United States under Politics. For Elections in Foreign Countries, see particularly Australia, Canada, New Zealand, and South Africa under History. For Labor Elections, see National Labor Relations Board.

ELECTIONS IN THE UNITED STATES. The Statewide elections held during the year 1943 were few in comparison with those held in 1942 and others scheduled for 1944. In 1942, for example, State offices were voted upon in all States but Kentucky, Mississippi, and Virginia. Throughout the nation, however, observers watched the 1943 elections closely for any bearing, they might have on the 1944 elections for Federal and State offices. The results gave rise to a spate of predictions and counter-predictions, Republican spokesmen fore-seeing G.O.P. victories in 1944 and Democrats discounting these claims by pointing to factors which determine national elections but which were not present in 1943. On the whole, the Republicans derived more comfort from the 1943 State elections than did the Democrats, although the fact that many voters stayed away from the polls could be regarded as a qualifying factor.

Elections to State offices were held in 1943 in Kentucky, Michigan, Mississippi, New Jersey, and New York. In Michigan only county and local officials and the State commissioner of education were elected. New York's election, at first scheduled only for county officials, was expanded to include certain State offices, particularly the lieutenant governorship, left vacant because of deaths and resig-

nations.

Elections for governor were held in Kentucky, Mississippi, and New Jersey, all of which had Democratic governors prior to these elections. The State election in Kentucky (November 2) proved to be the most unexpected "upset." In that State, usually Democratic and almost consistently so since the early 'thirties, the Republican nominee for governor, Simeon S. Willis, was elected by a majority of 8,300 votes over his Democratic opponent, J. Lyter Donaldson. At the same time the Republicans won all other important State offices except that of Secretary of State which went to the Democratic candidate.

The gubernatorial election in New Jersey (November 2) also resulted in the replacement of a Democrat by a Republican. The voters in that State gave the Republican nominee, former governor Walter E. Edge, a handsome majority of more than 125,000 over the Democratic nominee, Mayor Vincent J. Murphy of Newark. Fought chiefly on local issues, the election was widely interpreted as a defeat for Democratic "boss" Mayor Frank Hague of Jersey City.

The election of Democratic candidate Thomas

L. Bailey for governor in Mississippi (November 2) was a foregone conclusion. The real race in that State took place in the August primaries. In the first primary on August 3, former governor Martin S. Conner led all of his opponents for the nomination. In the run-off primary on August 24, however, Thomas L. Bailey, State legislator for twenty years, defeated Conner for the nomination.

After the inauguration of these governors-elect in December, 1943, and January, 1944, Republican governors will be in the majority for the first time since 1931. At that time there will be 26 Re-

publican and 22 Democratic governors.

The lieutenant governorship in New York, left vacant by the death of Republican Thomas W. Wallace who was elected to the office in 1942, was followed at least as closely as were the guber-natorial elections in other States. Many commentators held that the result would indicate popular approval or disapproval of the administration of Governor Dewey and, possibly, the political complexion of the nation's largest State in the 1944 campaigns. In the November 2 election, former State senator Joe R. Hanley, Republican nominee, defeated Lieutenant General William N. Haskell (retired), nominee of the Democratic and American Labor Parties, by a comfortable plurality of about 340,000.

ELECTRICAL INDUSTRIES. To say that the present World War is a mechanical war would seem trite even to a school child, in view of the utter profusion of airplanes, amphibious vehicles, tanks and other armored vehicles, radio communications and remote controls, naval and transport vessels. However, startlingly few people realize that, in truth, this is an electrical war; that every piece of equipment just mentioned, and many others, would be dead and useless hulks if it were not for the electrical devices that give them life, from the ignition systems which give life to the tank or airplane engine to the electrical range-finding and firecontrol devices which give concentrated striking power to the modern battleships of the air as well as those of the sea.

The electrical industry in 1943 produced 33 per cent more and shipped 50 per cent more than in 1942. The year's production was about 5½ times that of 1925, and substantially above the proportionate average for American industry as a whole. Considering the 1940 production figures as an index of 100, the 1943 production of electric motors and other industrial apparatus was 360, miscellaneous electrical materials 318, insulated wire and cable 148, electric power transmission and distribution equipment 135, electrical refrigeration equipment 12, and electrical appliances only 6. Thus did the war-expansion needs of American industry in general affect the electrical industry. As the year closed, the plant and machinery requirements for full-scale war production had been largely satisfied, raw-materials problems had been solved or at least brought under satisfactory control, and manpower in terms of available and effectively usable man-hours (including women) became the factor that will largely control the war output of American industry in 1944.

With the much-publicized "Big Inch" line in operation, attention shifted to a 20-inch pipeline, developed during the year to carry gasoline and heating oils from Texas 1,700 miles to the east the will be reversed by the property of the care than 100 000 coast. It will be powered by more than 100,000 h.p. in electric motors. At 29 pumping stations, located at approximately 50-mile intervals along the line, 88 1,250-h.p. 3,600-r.p.m. electric motors driving pumps will give the line the capacity to deliver daily to the New York and Philadelphia area some 235,000 barrels of gasoline, or the capacity of 14 trains daily, each made of 75 tank cars. Two of the year's largest electric motors were the two 20,000-h.p. motors developed for the U.S. Army Air Forces new "stratosphere" wind tunnel at Wright Field. These motors will drive fans designed to develop a 600-mile-an-hour current of refrigerated air, which will be used to test highaltitude sub-stratosphere performance of combat and other aircraft.

Portable trailer-mounted X-ray equipment was developed and is in active military medical use on many fronts. These units were designed to use standard X-ray films, and include complete darkroom processing equipment. X-rays also have been further adapted to industrial purposes. This is typified by a new mass-production X-ray machine capable of inspecting 17,000 airplane alloy castings in a 24-hour day. Key to the speed of this unit is a moving conveyor which transports the castings through the X-ray inspection chamber, producing every 30 seconds an exposed film covering groups of six castings. Quick processing of the film provides an inside view of the six castings, revealing any that should be discarded because of internal

defects. (See Physics.)

In the metallic field, a high-frequency method of heating enables the heating effects to be localized, a feature especially applicable to surfacehardening, brazing and silver-soldering, and an-nealing. The surface-hardening of steel products can be accomplished without the destruction of valuable sub-surface toughness that is likely with flame or oven heating. Also distortion and scaling are obviated, so that final machining can be ac-complished prior to heat treatment. Further, the process lends itself to application through the medium of completely automatic machines, where items of nominal size are involved. Radio-frequency currents (up to fifteen million cycles) are utilized, the power being supplied by vacuum-tube oscillators ranging up to 200 kw in output capacity. Light-weight high-voltage selenium rectifier equipment was developed for air-borne applications. Also, large industrial types of selenium rectifiers were developed, 12-volt 45,000 ampere equipments having been installed in three steel mills to serve tin-plating lines. The amount and proportion of tin required for electro-plating was reduced, and the continuous plating process appreciably speeded up, by the development of new and improved chemicals. Also, a new and simpler method by which silver may be electro-plated on mag-nesium to prevent oxidation was developed. The amplidyne system of electrical speed control, perfected a few years ago for power and industrial applications has found innumerable and invaluable wartime applications; for example, in the rapid and precise control of multiple gun direction.

A new airplane compass, known as the Gyro Flux Gate Compass, was developed. This compass is unaffected by motion of the plane within normal operating limits, by bomb load, armor plate, or other metal parts, or by the electric fields set up by the relatively heavy current in the various electrical circuits of large modern bombardment aircraft.

The greatly expanded use of air-conditioning refrigeration, and heat-transfer equipment to speed war production, facilitate testing, and improve products was one of the significant developments of the year. (See Heating and Refriceration.) Dry-surface heat-transfer units to dissipate heat from mercury-arc rectifiers were extensively installed at several aluminum plants; similar equipment, applied to the cooling of transformers made possible appreciable savings in critical materials. Two- and three-stage refrigerating units, capable of producing refrigerant temperatures as low as -130° F., represented an appreciable advance in the technique of applying mechanical refrigeration to low-temperature testing and processing.

The use of strategic light metals-magnesium, magnesium alloys, aluminum, and high-strength light alloys-has been facilitated by the development of both manual and automatic equipment for the electric arc-welding of these metals under a protective shield of helium or argon gas. The welding of these metals requires precise control of concentrated heat coupled with the shielding of the molten metal from the oxidizing effect of oxygen in the air. A new electronic control enables automatic equipment to hold proper are length even while the arc traverses irregular patterns such as those encountered in the welding of curved-surface parts. Heart of the manual equipment is a special holder for the tungsten or carbon electrode that not only conducts electric current to the electrode, but surrounds the electrode with a stream of helium or argon gas. Typical of the develop-ments arising out of demands from shipyards and other outdoor installations is a new A-C welder having a current range from 100 to 625 amperes at 40 volts, designed for outdoor use regardless of weather. Special controls prevent the no-load voltage from rising above 35, but provide full power for welding the instant the arc is struck. Experience and research have revealed that in the use of capacitor discharge control for the welding of aluminum and its alloys, better welds can be produced with less energy by precisely timing the application of the supplemental capacitor impulse to the welding electrode. For this purpose, a new D-C precision timer has developed. Fully electronic control for seam welding was developed and applied in many war industries, for example in the welding of the droppable supplemental gasoline tanks that have enabled Lightning P-38 fighters to accompany heavy bombers several hundred miles deeper into enemy territory. The refinement of automatic and precisely controlled electric welding processes in this connection also permits the substitution of thin steel sheets in place of the war-scarce aluminum formerly used.

Typical of the expedited production of electric propulsion equipment for marine application is the fact that by the end of 1943 some two million horsepower in specially designed turbine-electric propelling equipment had been produced for the new destroyer escort vessels. (See Naval Prog-RESS.) Novel in design, the main turbine-generating units, including condenser and foundation, are integrally designed to facilitate shipboard installations as consolidated units. The condenser forms the foundation for the complete unit. The associated main propulsion motors also are designed so that they may be installed directly on prepared foundations as a unit of the ship. Dual generating and propulsion equipment provides maximum speed for tactical operations, but permits twin-

screw operation from a single generator for economical cruising or in the event of damage to one engine or boiler room. For ocean-going tankers, the horsepower of the average installation of propulsion equipment is approximately double that of the equipment in prewar vessels. During the year, the first high-speed tankers were put into service, with turbines operating at 590 pounds pressure and 850° F. total temperature. The production of Diesel-electric propulsion equipment for minesweepers, harbor tugs, submarines, tankers, salvage vessels, net-tenders, and fleet tugs was nearly double the total horsepower produced in 1942. The horsepower of individual installations went up too, 13,000-h.p. installations being under consideration for special-duty ships. Induction-synchronous electric couplings were built to permit two or more Diesel engines to transmit their output to the highspeed element of a single gear-set for the driving of a single propeller shaft. The low-speed element of the gear set is directly connected to the pro-peller shaft of the vessel, the electric couplings (involving neither bearings nor shaft) are interposed between the coupling flanges of the engine and the high-speed gears. The engines then are connected to the load by simply energizing the electro-magnetic fields of the coupling, and disconnected by deenergizing those fields. Operation in either direction is possible with one or more engines, simply by starting the engines in the desired direction and energizing the corresponding couplings. Among the physically largest marine electric motors built were some rated at 10,000-h.p. Electric propulsion motors built for tankers alone during the year total well over a million horsepower (See Shipbuilding.)

Diesel electric developments extended into the railroad field, too. Of special interest were units ranging up to 75 tons developed to meet the exacting requirements of the U.S. Army for operation in foreign theaters of war. It was necessary for these locomotives to conform to special international clearance specifications, and to be provided with special end-plates to permit interchange of either standard automatic couplers or special drawhooks and buffers of the European type, to permit the universal use of the equipment wherever

the gauge permits. See RAILWAYS.

One of the more interesting applications of industrial X-rays is in connection with the inspection of military explosives. In one instance continuous automatic inspection is provided to check the amount of powder in hand-grenade fuses, at the rate of 4,000 per hour. When a fuse with insufficient powder is encountered, the X-ray inspection equipment automatically activates visual and audible alarms, daubs red paint on the faulty fuse, and records the incident on a meter chart. In another installation, million-volt X-ray equipment is used to search out possible cavities in the explosive charge of 155-mm. shells. The million-volt X-ray equipment was used for this application because of its ability to distinguish accurately between relatively slight differences in density of the total mass penetrated; for example, distinguishing be-tween the completely filled and the partially empty explosive space inside the shell after passing through as much as an inch of steel in the shell walls. The X-ray outfit is located at the center of a twelve-foot "merry-go-round" on which the shells are carried. Half of the tip of each shell is within the heavy-walled examining room, for the protection of the operators. A film attached to each shell is given a nine-minute exposure as the shell passes through the examining room. After the shell

emerges, the film is removed and immediately developed to indicate whether the shell should be accepted or rejected. The process is continuous.

Unique among the power-plant equipment produced during the year were two complete 10,000-kilowatt mobile power plants built on specially designed railway cars under the supervision of the U.S. Navy Bureau of Yards and Docks. These mobile power plants are the first of their kind to be built, and were intended by the Navy Department for quick dispatch to any continental Navy yard, repair station, or other location where for emergency or other reasons supplemental power might be needed on short notice. Each of the mobile plants comprises a train of six cars, on which standard power plant equipment, from boilers to

the electric generators, was adapted.

Electrical driving, heating, and control devices contributed directly to the ability of the American steel industry to establish in 1943 an all-time record high output of some 93,000,000 ingot tons. The increase in production of electrical steel ingots was especially phenomenal; from a 1941 production of \$,750,000 tons to a 1943 production of 6,000,000 tons. From the military standpoint, one of the most strategically important and significant factors was the steel industry's capacity to turn out the huge and largely unexpected tonnage requirement of steel sheets. As the war approached, many competent observers criticized the American steel industry for developing its sheet-rolling capacity to the extent that it had been developed in 1930-40 decade, regarding such capacity as largely nonessential for war needs. The capacity, however, has proved literally providential in the face of the actual requirements of this modern mechanical war for steel sheets in enormous amounts and great variety, for uses ranging from aircraft to tanks, armored vehicles, and the merchant ships that once again have given the United States the greatest merchant fleet afloat in spite of intervening losses from submarine attack. The use of thin steel sheets, spirally wound and electrically welded to form thin-walled steel tubing, contributed directly to the Allied military success in the hundreds of miles of north African desert campaign where pipelines of this tubing were laid day by day behind the advancing combat zone to carry the fuel and water which constituted the life-blood of the combat elements, and releasing the huge and vulnerable fleets of transport vehicles that otherwise would have been involved. The use of electrically driven and electrically controlled hot-strip mills for the rolling of plate instead of strip has more than doubled the nation's capacity to produce plates. On the other side of the picture, these electrically controlled mills are capable of turning out, under very close tolerances, sheets or strips down to a thickness of a thousandth of an inch and in continuous lengths of two miles or more. Industry's capacity for rolling aluminum increased materially during the year (the nation's aluminum-producing capacity is reported to have been increased tenfold in the last three years). One of the new mills is located in the State of Washington, and comprises two reversing roughing mills followed by a five-stand tandem hot rolling mill, requiring a total of 28,250 h.p. in seven driving motors, having speed ranges from 30/60 r.p.m. on the first stand to 250/550 r.p.m. on the fifth stand. A new "largest" semi-continuous plate mill for rolling steel was being finished in Utah as the year came to a close. This mill will handle plate 132 inches wide and will involve a series of rolls using nine motors totaling 33,500 h.p.

The electrical industry's appliance manufacturing capacity was essentially diverted to war needs.

Plastics were put to many new uses in the electrical industry, in conservation of more critical materials. One of the more notable developments was low pressure molding processes which facilitated the production of high-strength light-weight parts. This system is based around a method of impregnating various types of cloth and paper with plastic resins, the laminations being subjected to heat and pressure. Typical war products are plastic caps for trench-mortar shells, and housings for loop antennae on aircraft. See Plastics.

Electrical contributions to the aviation industry were many and significant, the following examples being only typical. Aircraft gun turrets not only are electrically driven, but in the newer and larger air-craft are subject to coordination through interlocking central fire-control systems. Automatic and semi-automatic flight-control devices not only relieve the pilot and navigator of some of the physical burden of long-range flying, but assure a remarkable accuracy in precision flying. Electric drive has been applied to the gyroscopes which are the heart of horizon-indicators, direction indicators, horizon controls, directional controls, and other strategic flying instruments. Electric drive provides a constancy of speed independent of altitude, air density, or temperature, all of which adversely affect the previously air-driven gyroscopes. To overcome difficulties previously encountered in highaltitude operation, new ignition systems have been developed. New radio transmitting equipment, and the largest used on the aircraft to date, provides a continuous frequency range through the use of plug-in tuning units, and provides facility for continuous-wave telegraph, voice, and modulated continuous-wave transmissions at any frequency within the range. To relieve pilots and flying observers of the relatively slow process of making notes by pad and pencil, a new equipment provides for the recording of up to 66 minutes of continuous speech on 11,500 feet of hair-size steel wire contained on a spool about the size of a doughnut. This is one of the first practical applications of the magnetic recording of speech which, at the time of the 1939-40 World's Fair, was merely a novelty by means of which visitors were enabled to "listen back" to a few seconds of their own speech. The system has been developed to a point where a given magnetic recording is good for 100,000 or more reproductions without any deterioration in quality, although the steel wire "record" may read-ily be "wiped" clean by a simple magnetic process and made ready for new use. Altogether, modern aircraft depend for their successful operation on some 150 electrically operated devices, although not all are involved on any one aircraft. The extent of aircraft systems may be indicated by the statement that the larger bombers may use up to two dozen different electric motors, and certain of the circuits may at times have to carry currents of several hundred amperes. To meet these increasing electrical demands, new and larger aircraft generators have been developed, weighing less than two pounds per kilowatt in output, and ranging up to 30 kilowatts in output capacity.

Characterized by an Army Ordnance spokesman as "one of the greatest advances in the art of fire-control made during this war," was a new electric gun-director which was given an official public showing in New Jersey in November, 1943. This "M-9" director utilizes electric circuits to make its calculations, in place of mechanical movements which emphasize human errors. See Physics.

Adding to the group of calculating boards, network analyzers, and electro-mechanical mathematical calculating machines, a new differential analyzer was developed during the year, utilizing photo-electric polarized light beams in lieu of certain mechanical or electrical connections, thus reducing the time required for the solution of more complicated problems. See articles on minerals and other products and industries; MACHINE BUILDING.

ELECTRICAL TRANSPORTATION. See RAILWAYS; RAPID TRANSIT.

ELECTRIC HOME AND FARM AUTHORITY (EHFA). An agency of the U.S. Department of Commerce which has financed the purchase of domestic electric and gas appliances and electrical wiring for homes and farms; now in liquidation under an executive order of Oct. 13, 1942.

FLECTRIC LIGHT AND POWER. Entering their third year of operation under the rigors of war demands for power and war restrictions of fuel, material, and manpower, the electrical utilities industry of the United States was in a stable condition and able to face 1944 with assurance. The rate of increase of war-industry power demands is expected to taper off toward a stable operating level, thus removing one of the uncertainties which plagued the electric power industry during 1943. Also it is estimated that there is an average margin of about 14 per cent of dependable generating capacity above expected peak loads, taking the country as a whole. This is no great margin of safety, and would not accommodate any catastrophies or general emergencies, especially in certain localities. By and large, however, the power situation is regarded as safe and satisfactory in the circumstances.

With an increase of only 6½ per cent in productive capacity, the American electric light and power industry accomplished a 17 per cent increase in power output. The 32 billion-kilowatt increase in power output in 1943 over the 1942 output is of itself as large as the entire United States electrical load was for the year 1943. Industrial power requirements for 1943 exceeded those of 1942 by 22 per cent, commercial and residential each by nearly 7 per cent. Corresponding figures for 1942 were respectively 26 per cent, 11 per cent, and 8 per cent; for 1941, 30 per cent, 10 per cent, and 7 per cent.

Power Production. The 221 billion kilowatt-hour

Power Production. The 221 billion kilowatt-hour electric power output in the United States for 1943 exceeded the 1942 output by 17 per cent. Corresponding increment for 1942 was 12 per cent, and for 1941 16 per cent. The recent rate of growth of the electric light and power industry can better be visualized when it is understood that 54 years (1882 to 1936) were required for the industry to grow to its first billion-kw-hr year as compared with only seven years (1936-43) to grow to its first two-billion-kw-hr year with a 21 per cent margin toward the third billion kw-hrs of annual output Fortunately, in view of the fuel shortages that were experienced in several sections of the United States and especially in the northeastern and Atlantic seaboard states, weather and rainfall conditions were such that hydroelectric plants were enabled to carry some 33 per cent of the total load as they also did in 1942. Continued expansion of government interest in the electric-power field is reflected in the fact that 18 per cent of the 1948

total output of electric power and 32 per cent of the year's increment over 1942 came from governmentally owned plants as compared with respective figures of 14 per cent and 30 per cent for 1942. Other statistical data on electric power generation are given in Table 1, where it may be noted that the effect of pressing old and obsolescent equipment into wartime use has increased the "use and loss" figures by about 50 per cent since 1939.

TABLE 1—ELECTRIC POWER PRODUCTION (Billions of kilowatt-hours)

| Year   | From<br>fuel | From<br>hydro | From<br>Canada | Gross<br>total | Uses<br>and<br>losses | Available<br>for<br>sale |
|--------|--------------|---------------|----------------|----------------|-----------------------|--------------------------|
| 1943 a | 146.6        | 74.4          | 1.5            | 222.5          | 36.5                  | 186.0                    |

<sup>6</sup> Preliminary figures <sup>b</sup> Revised figures

Financial. The all-time record increase of 27.7 billion kw-hrs in saleable electric energy for 1943 did not bring a corresponding record increase in revenue, reflecting the increased proportion of heavy bulk sales to industry. Gross revenue from power sales for 1943 was an estimated \$3,096,000,000, a 7.3 per cent increase over the 1942 revised figure of \$2,885,843,000. Energy sales to residential customers continues to be the largest single item, remaining at about 34 per cent of the total. Significant again is a \$35,000,000 increase in revenue reported from municipal and miscellaneous plants, reflecting a one-year increase of 53 per cent from governmentally-owned sources. A 10 per cent TABLE 2—ELECTRIC POWER SALES AND REVENUE

increase in revenue from power sales to street railways reflects the continuing effect of gasoline rationing and heavy war-worker traffic, and for the second year continues the reversal of the long and steady decline noted in these figures prior to 1942.

A statistical summary of data covering electric power sales and related revenue is given in Table 2.

Reports show that utility expenses are rising more rapidly than revenues. Operating revenue increased 7.9 per cent during 1943, but operating

expenses went up 12.1 per cent and taxes increased 12.7 per cent. Taxes took 25.1 cents out of every dollar of gross revenue, a cent more per dollar than was required for the industry's fuel, salaries, and wages combined. Total taxes were estimated at \$710,000,000.

The average residential consumer used an estimated 1,073 kw-hrs of electric energy during 1943 at an average rate of 3.64 cents per kw-hr, compared with 1,012 kw-hr at 3.67 cents in 1942. Thus, the steady upward trend of usage and the

downward trend of unit cost continued.

Rivaling the depression years of 1933 and 1934, 1943 saw only an estimated \$9,921,000 of new capital put into electric utilities, only about 10 per cent of the 1941 and 1942 figures. Including refundings, the total volume of financing in 1943 amounted to an estimated \$371,062,000 which was greater than the final figure of \$365,255,000 for 1942. Securities sold to institutional investors dropped from \$99,688,000 in 1942 to \$26,850,000 in 1943, whereas bonds, debentures, etc., disposed of in public offerings rose from \$226,800,000 in 1942 to \$329,300,000 in 1943. The decline in purchases by institutional investors probably reflects the requirement of the Securities and Exchange Commission for competitive bidding on bond issues.

Capital expenditures for new construction in 1943 totaled some 306 million dollars, as compared with 654 million for 1941, 520 million for 1942, and a projected 233 million for 1944. New generating capacity accounted for 55 per cent of the expenditure, the remainder going into the transmission and distribution facility required to get the power where it was needed. New generating capacity is expected to account for only about a third of the 1944 budget, the bulk going into transmission and distribution facility, distribution get-

ting the most.

Generation. Year-end reports indicate that about 1,835,000 kw in fuel-electric plants and 1,089,000 kw in hydroelectric plants was added in 1943, this total of 2,924,000 kw in new electric generating capacity very closely approximated the 2,970,000 kw that was allocated by action of the War Production Board in 1942, and indicates the degree of control effected. By its original action, WPB also had allotted to the utility industry for 1944 a maximum of 500,000 kw in new capacity, but additional allocations have brought this figure up to an expected 1,465,900 kw for 1944, about 60 per cent in hydroelectric plants and 40 per cent in fuel-electric plants. On this basis, the expansion in electric generating capacity for the three-year period ending with 1944 will amount to 94 per cent of the total new capacity added in the decade 1931-40. The increase in electric generating capacity for the first two war years totals slightly more than 13 per cent of the 1941 United States capacity. Of the total United States generating capacity, the ratio of about 28 per cent hydroelectric to 72 per cent fuel-electric continues. Publicly owned (Federal and local governments, power dis-

tricts, cooperatives, etc.) power plants account for some 19.4 per cent of the U.S. total, the Federal government itself owning 8.9 per cent. As in 1942, the bulk of new generating capacity for 1943 went to the Pacific Coast and to the South to serve the war loads that had been concentrated in those areas. Selected statistical data are given in Table 3.

The geographic distribution of electric generating capacity in the United States as of the close of 1943 is given in Table 4.

TABLE 4—DISTRIBUTION OF ELECTRIC GENERAT-ING CAPACITY REPORTED ON ELECTRIC UTILITY POWER PLANTS AT CLOSE OF 1943

For the 12-month period ended Oct. 31, 1943 coal, gas, and oil the calculated equivalent of nearly 94 million tons of coal were consumed in the generation of 140,215,000,000 kw-hrs of elec-tric energy. As the result of many obsolescent plants and equipment being pressed into service in the war emergency, the fuel burned per kw-hr of power generated went to 1.34 pounds of coal or equivalent—the same figure as was reported for 1941, and somewhat higher than the record low of 1.31 for 1942. The industry held its consumption of critical oil to its 1942 figures—which were 25 per cent under the 1941 figures—by increasing its use of gas by 20 per cent and coal by 12 per cent. The use of natural gas for power-plant fuel has doubled in the past seven years, and is six times what it was in 1924. Fuel plants, comprising 72 per cent of the total U.S. generating capacity, carried 67 per cent of the total load, while favorable water conditions enabled hydroelectric plants to carry 33 per cent of the total load on 28 per cent of the total U.S. generating capacity. See Machinery Industry.

Rural Electrification. According to published reports, the Rural Electrification Administration had a total of 810 systems in operation by the end of 1943, serving a total of about 1,080,000 customers. Comparable revised final figures for the close of 1942 are 803 systems and 1,012,284 customers. A total of 387,900 miles of power lines were reported to be in operation at the end of 1943, as compared with 378,015 miles at the end of 1942, and 348,062 miles at the end of 1941. Generating plants were reported to be in operation on 67 of the systems, totaling 72,000 kw in generating capacity, as compared with 60 systems reporting a capacity of 57,500 kw at the end of 1942. REA systems produced about 198,000,000 kw-hrs of electric energy in 1943, and purchased an additional 1,820,000,000 kw-hrs, as compared with a 1942 performance of 131,000,000 kw-hrs generated and 1,305,000,000 kw-hrs purchased for 1942. Electric energy sold to REA consumers increased from 803 kw-hrs in 1941 to 1,137 in 1942 and 1,546 in 1943, at a respective price per kw-hr ranging from 4.84 cents in 1941 to 4.08 in 1942, and 3.32 in 1943. This rapid increase in rate of energy used per customer and corresponding decline in price per kw-hr undoubtedly reflects the addition of large blocks of low-rate industrial load to the REA systems rather than increased usage by actual rural customers. REA efforts to connect new customers to existing lines are reflected in the figures of 2.59 customers per mile of line in 1941, 2.67 in 1942, and 2.78 in 1943.

By the close of 1943, the total public funds that

had been allotted to REA amounted to some \$472,-000,000, earmarked to be spent \$418,000,000 for distribution lines, \$43,000,000 for generation and transmission facilities, \$11,000,000 for consumer facilities. These figures include 1943 allotments of approximately \$11,500,000. See AGRICULTURE.

Government. Close control of utility operations under war regulations continued. Early in the year, a more important place in the war production program was accorded to electric utilities through the creation within the War Production Board (q.v.) of the Office of War Utilities, wherein was con-centrated the war regulation of all utilities excepting transportation, with WPB vice-chairman J. A. Krug as director. Numerous changes were made during the year in war regulations, to meet current conditions. The food shortage situation won recognition through rescission of bans on the construction of 32 rural cooperative lines and release of materials for these rural extensions. Gradual re-lief was noted in the limitation placed on the use of material for nondirect war use, as relative surpluses of previously critical materials began to appear. This was particularly true of copper. By the year end, dim-outs, which had plagued both coasts, were canceled. Also legislation passed in Illinois, Michigan, Ohio, and Georgia, switching those states back to their respective standard times from the advanced "war time," reflected public dislike for the more or less over-played effects of the time change.

Although proponents of publicly-owned power developments continued active during the year, less agitation for municipal ownership was noted than in any of the preceding 10 years. Twelve elec-tions were reported, 3 for and 9 against municipal ownership. Senate investigations were initiated on the REA, the Columbia River, the Shipshaw, and

the Grand River projects.

The U.S. Supreme Court voted to review the decision of a lower court upholding the "death sentence" of the 1935 utility Act, but was unable to accomplish anything because so many of the justices disqualified themselves. The disintegration of electric-utility holding companies under the act went into its final stages during the year, the United Gas Improvement and the North American systems, two of the largest in the country, voting to dissolve, while other systems accelerated the disposal of their properties. A total of 175 changes in ownership of electric utility properties (complete systems or parts of systems), have been announced to date since the effective date of the so called holding company Act of 1935. During the year 32 divestments of holding company property were reported by the Securities Exchange Commission, of which 9 sales were made to cities or other public ownership agencies, the remainder remaining in private ownership. For the most part, the divestments were accomplished by mergers, although in some instances operating properties be-came independent of all holding company con-trols. On the basis of the results so far, the operation of the utility act has not upheld the early belief of many observers that the dismemberment of holding companies would result in a large increase in public ownership of the utility properties.

The Federal Power Commission (q.v.) continued active in the enforcement of devaluation, ordering a total of nearly a half-billion dollars to

be squeezed out of utilities' book values. The investigation of the FPC into the rates charged in Arkansas to an aluminum plant precipitated considerable debate on the matter of states' rights. As the outgrowth of resulting court action, the National Association of Railroad and Utilities Commissioners voted to request Congress to clarify the Federal power act by amendments to prevent FPC encroachment on the rights of states' regulatory authorities. EL SALVADOR. A republic of Central America. Capital, San Salvador.

Area and Population. The smallest and most densely populated of the Central American states El Salvador has an area of 13,176 square miles and a population estimated at 1,862,980 in 1943. Indians and mestizos constitute the vast bulk of the population, but the small ruling class is largely of Spanish descent. Populations of the chief cities in 1940 were: San Salvador, 107,859; Santa Ana, 88,612; San Miguel, 47,835; Santa Tecla, 34,941; Ahuachapán, 32,962; San Vicente, 30,722. Living births in 1941 numbered 72,376; deaths, 30,490.

Defense. Military service is compulsory in wartime. In December, 1941, part-time training was ordered for all males between 15 and 50 years of age. The active army on Jan. 1, 1941, numbered 8,370 officers and men (including National Guard), with 78 men in the air force. Trained reserves totaled 728. In 1941, a U.S. Army officer replaced a German as director of the Military Academy, Defense estimates for 1943 were 4,043,000 colones. In December, 1941, the U.S. Government agreed to supply El Salvador with armaments valued at \$1,640,000, only \$1,040,000 of which was to be repaid in six yearly installments.

Education and Religion. Illiteracy remains widespread. At the beginning of 1941, there were 1,349 primary schools with 102,042 regular pupils and 27,452 in special courses for illiterates; 2,551 students in secondary schools; 218 students in four normal schools; 422 students in the National University; and 413 in the School of Music. Roman Catholicism is the dominant religion.

Production. The total value of El Salvador's national production was estimated at \$55,362,300 for 1942, or more than double the value for 1932. Agricultural production accounted for 82.5 per cent of the 1942 total (\$45,619,600); industrial for 15.5 per cent (\$8,601,400); mineral, 2 per cent (\$1,141,300). Coffee normally yields from 80 to 90 per cent of the value of total exports, but it constituted only 29 per cent of the value of 1942 production. Estimated yields of the chief 1942-43 crops were: Coffee, 916,600 bags (of 132 lb.); cotton, about 6,882,000 lb.; sugar, 21,000 short tons. Henequen, rice, tobacco, indigo, corn, and beans are other important crops. The republic has a virtual monopoly of Peru balsam, gathered from the forests. Gold production is about \$1,000,000 annually. Manufacturing is restricted largely to sugar refining, cotton milling, and the production of henequen bags, cigarettes, soap, leather goods,

Foreign Trade. Including bullion and specie, general imports in 1942 amounted to 21,432,000 colones (20,827,000 in 1941) and general exports to 44,928,000 colones (28,010,000 in 1941). 1941 the United States took 79 per cent of El Salvador's exports (61.7 in 1938) and supplied

77.7 per cent of the imports (46.8 in 1938).

Finance. Budget estimates for 1943 placed receipts and expenditures at 23,901,000 colones and 23,896,000 colones respectively (23,723,000 and 23,721,000 respectively for 1942). Public debt on Jan. 1, 1942, 43,640,973 colones (external, 38,381,-775; internal, 5,259,198). Service of the external debt remained in default during 1943. The colon is

pegged to the U.S. dollar at 1 colon equals \$0.40.
Transportation. El Salvador in 1942 had two railway systems, with 378 miles of line; air services to the principal towns, provided by the Pan American Airways and TACA systems; and over 3,700 miles of highway. The section of the Pan American Highway pioneer road from San Salvador to Managua, Nicaragua, was opened to traffic in April, 1943. It brought San Salvador within 16 hours of Managua and 24 hours of Guatemala City. A total of 802 ships sailed from El Salvador's three principal ports (La Libertad, La Unión, and Acajutla) in 1941. In that year 3,102 passengers entered or departed from the republic by boat and 5,120 by airplane.

Government. The Constitution of Jan. 20, 1939, vests executive power in a President elected for six years and ineligible to succeed himself. Legislative power rests in the unicameral National Assembly of 42 members elected for one year by universal suffrage. President Maximiliano H. Martínez seized power through a military coup Dec. 2, 1931. After serving out his predecessor's term, he was selected for a four-year term beginning Mar. 1, 1935, and on Jan. 21, 1939, his term was extended for six years to Jan. 1, 1945, by a hand-picked Constituent Assembly (see 1939 YEAR BOOK, p. 602). The National Assembly (see 693). The National Assembly declared a state of war with Japan on December 8 and with Germany

and Italy on Dec. 12, 1941.

History. The close economic and political ties that developed between El Salvador and the United States in 1942 (see 1943 YEAR BOOK) were knit still more tightly during the ensuing year. On March 25 Washington agreed to extend the agreement of Mar. 27, 1941, for the detail of a U.S. Army officer to serve as Director of the Military School and of the Military Academy of El Salvador. Work progressed on the Salvadoran section of the Pan American Highway despite a crucial shortage of cement. The new pioneer road from San Salvador to Managua, Nicaragua, was traveled for

the first time in April.

The joint United States-Salvadoran agricultural, health, and sanitation program was carried forward. The new agricultural experiment station in the San Andrés valley, a land reclamation and malaria-control project in the Sonsonate region, and a new cooperative project for the increased production of food were major enterprises in this program. Under a contract signed in Washington early in the year, the Institute of Inter-American Affairs undertook to provide funds, equipment, and technical experts to increase Salvadoran food production as a source of supply for armed forces and civilian workers in the Panama Canal Zone. About 6,000 Salvadorans were reported to have migrated to Panama to work on the new set of

Economic conditions remained favorable due to continued heavy coffee shipments to the United States, the activity on public works, and remittances estimated at \$1,000,000 annually received from Salvadoran workers in the Panama Canal Zone. There was, however, an inflationary rise in prices; in October imported foods were reported 80 per cent higher than in 1938 and drygoods 75 per cent higher. Living costs of the lower middle class were about 38 per cent above normal. The principal business firms, banks, and railway companies granted their employees, represented by the newly organized Union of Commercial Employees, a 25 per cent salary increase. The Government also sought to curb rising prices by new price control measures, particularly the decree of September 2 authorizing the Committee of Economic Coordination to fix maximum prices for many imported and domestic articles.

Coffee exports in 1942 reached the highest value in 17 years, while imports remained fairly stable. As a result the Central Bank doubled its gold and foreign exchange reserves. The Government took advantage of the favorable financial outlook to increase the export tax on coffee for the 1943–44 crop by 200 per cent, effective Nov. 12, 1943. The decree set aside the entire proceeds of the coffee tax for payment of interest and amortization on the external public debt, which had been in complete default since Nov. 27, 1937. The total public debt on Apr. 30, 1943, amounted to 52,162,000 colones, or about \$20,865,000. Late in December an official Salvadoran mission booked passage for Washington to discuss "economic questions of interest to both nations." It was expected that an agreement on terms for the resumption of debt payments would be agreed upon. See World War.

EMERGENCY MANAGEMENT, Office for (OEM). The Office for Emergency Management was established in the Executive Office of the President by administrative order of May 25, 1940, in accordance with section I (6) of Executive Order 8248, of Sept. 8, 1939, which provides that there shall be, "in the event of a national emergency, or threat of a national emergency, such office for emergency management as the President shall determine."

The Office for Emergency Management as such formerly had certain stated functions which were performed under the direction of the Liaison Officer for Emergency Management. This official existed under the terms of the administrative order issued by the President on Jan. 7, 1941, to the effect that "provision may be made in the Office for Emergency Management for liaison facilities..." When the President, by letter of Nov. 3, 1943, accepted the resignation of the Liaison Officer for Emergency Management, he appointed no successor; the effect was to terminate the liaison facilities under the optional provisions of the administrative order of Jan. 7, 1941.

The Office for Emergency Management is primarily a framework within the confines of the Executive Office of the President, within which framework various civilian war agencies have been established. It has served as a major device for organizing the war program. At present the Office for Emergency Management embraces the following war agencies: National War Labor Board, Office of Alien Property Custodian, Office of Civilian Defense, Office of the Coordinator of Inter-Ameri-

can Affairs, Office of Defense Transportation, Office of Scientific Research and Development, Office of War Information, War Manpower Commission, War Production Board, War Relocation Authority, War Shipping Administration, Office of Economic Stabilization, Office of War Mobilization, Commitstee on Fair Employment Practice, Foreign Economic Administration, and the Division of Central Administrative Services.

ENGLAND. See GREAT BRITAIN.

ENGLAND, Church of. The year 1943 was a notable one in the ecclesiastical life of England and in that of the Anglican Communion as a whole. The continued growth of interest in religion among the men and women of H.M. Forces was paralleled by public interest at home; the Government's education policy raised hopes that religious instruction may receive a better place in the national system of education; and planning on a bold, far-reaching scale was in progress both at home and overseas for the development of the life and work of the Church after the war.

During the year the growth of the Armed Forces called for the release of more and more clergy to meet the shortage of chaplains. Outstanding success attended the institution in many units of the "one-man religious brains trust" known as "The Padre's Hour." In conveying a Christmas greeting from the Church Assembly to the Anglican Chaplains, the Archbishop of Canterbury was able to quote striking testimony to the excellence of their work from "many officers holding high rank in all three Services." Success also attended the activities of the specially selected women who have been assisting the chaplains in work among the women members of the Forces. The Right Rev. Leslie Owen, translated to the vacant Suffragan See of Maidstone, will have the chief responsibility in relation to the training of candidates for Ordination now serving with the Forces and in civilian life.

The nationwide response when H.M. the King called his peoples to prayer on September 3 was again most impressive. Empire Youth Sunday, under the patronage of H.M. the King, was observed with enthusiasm throughout the country, as was also "Battle of Britain" Sunday on September 26. "Religion and Life Weeks" were held in many cities and towns, and many more have been

planned for 1944. Interest in the problems of Evangelism, including the presentation of the Gospel in terms of modern thought and the use of modern methods such as religious "brains trusts," broadcast and cinema services, etc., was stimulated by a debate in the Summer Session of the Church Assembly, when a Resolution was passed approving the appointment of a Commission to inquire into this subject. S.P.C.K. agreed to form a "Church of England Films Commission" which will act as a center for collecting and distributing

information about religious films.

The Church has been very active in thinking and planning for the postwar world, and no aspect of such planning has been more insistently pressed than the need that religious education should be made available in all schools. The policy and plans of the National Society, the Central Council of the Church for Religious Education, were finally approved by the Church Assembly. The Royal Assent was given in November to the Diocesan Education Committees Measure, which insures that an Education Committee shall be set up in each diocese. Many plans were discussed for postwar reconstruction with a view to the more effective use of available clerical manpower. Such plans should be facilitated by the Reorganization Areas Measure passed by the Church Assembly at the Autumn Session. The better payment of the clergy should be facilitated by a new scheme ("Scheme K") issued by the Ecclesiastical Comsioners

On December 15 it was reported at a meeting of the Central Board of Finance of the Church of England that the diocesan contributions to the Church Assembly Fund from January 1 to December 14 totaled £80,325. 4s. 9d. as compared with £68,909. 8s. 2d. in the corresponding period of

1942.

The cause of Christian cooperation and understanding was furthered by a joint Statement of Christian Belief issued by the Archbishop of Canterbury and the Moderator of the Free Church Federal Council on January 4, and by a series of speeches and addresses by the Archbishop of Canterbury. The Archbishop of York (Dr. C. F. Garbett) in September visited Russia "to carry from the Church of England to the Orthodox Church an expression of deep sympathy and heart-

felt admiration for Church and people. . . ."
In the United States "advance on a worldwide front, with particular emphasis upon China in the overseas field and Negro work at home" was set forth as the strategy of the American Episcopal Church (q.v.). In Canada the Church has had new problems created by the opening of the Alaska Highway, and has been preparing to do its full duty in connection with the plans which are being laid for postwar immigration, largely from the British Isles. In the West Indies the Church has been contending with a dearth of clergy and with economic problems due to the exchange rates and the difficulties of the banana industry. Many readjustments have been needed in India as the result of the war. In Australia the year has seen the development of a great Missionary Movement. The Episcopal Synod of the Church of the Province of South Africa has appealed to Europeans in South Africa to combat their prejudice against the colored races.

Matters dealt with by the Church Assembly in addition to those already mentioned, included the Budget of £145,000 for 1944, and the Report (communicated by the House of Bishops) of a Commission on the Remuneration and Housing

of the Clergy and Other Matters relating to the Legislative and Administrative Machinery of the Church of England. Other events included a statement by the Archbishops of Canterbury and York on the spread of venereal disease; an appeal by the Church of England Waifs and Strays Society for large suitable houses in safe areas to accommodate the children on its waiting list; the development of youth work by the Church of England Youth Council, and the enthusiastic reception by the Orthodox Patriarch of Alexandria of the Archbishop of York on his arrival in Cairo when returning from Russia.

ERITREA. A former Italian colony on the west shore of the Red Sea, incorporated in Italian East Africa by Mussolini's decree of June 1, 1936, but placed under direct British control following the conquest

of Italian East Africa by British Empire and allied forces in 1941. Capital, Asmara.

Area and Population. The original Italian colony had an area of 45,754 square miles and a population in 1936 of 650,000. When the colony became a province of Italian East Africa, additional Ethiopian districts were added median additional Ethiopian districts. pian districts were added, making a total area of 89,274 square miles and a population estimated at 1,500,000 as of May, 1939. With the liberation of Ethiopia, Eritrea's original boundaries were restored. The chief cities are Asmara (7,765 feet above sea level) and Massaua (the principal port), with 23,000 and 15,000 inhabitants respectively, according to 1939 estimates. The natives are divided racially into Tigréans, Danakils, etc., and religiously into Mohammedans, Christians (Copts), and pagans.

Production, etc. Stock raising, agriculture, fishing, and some mining are the chief occupations. Many and some mining are the emer occupations. Many natives lead a pastoral existence. Latest available crop figures are (in metric tons): Wheat, 3,800 in 1937–38; barley, 19,000 in 1937–38; com, 6,000 in 1938–39; linseed (exports), 3,900 in 1934–35; sesamum, 500 in 1937–38. The Italians developed banana and other irrigated plantations along the coast. The normal production of salt is 200,000 tons annually; of gold, about 78 kilograms in 1936. Imports in 1938 were valued at 52,200,000 old U.S. gold dollars; exports \$4,400,000.

Transportation. A railway extends from Massaua through Asmara, Cheren, and Agordat to a point

near the western frontier. A line connecting this railway with the Kassala-Port Sudan railway was under construction in 1942. Motor highways built by the Italians link Massaua with Asmara, with Addis Ababa and Gondar in Ethiopia, and with Kassala in the Anglo-Egyptian Sudan. From Assab, secondary Red Sea port, another road leads to Dessye, Ethiopia, on the Asmara-Addis Ababa highway.

Government. Eritrea remained throughout 1943 under the direct control of the British Army's East African Command. An experienced British colonial

official assisted in its administration.

History. According to a delayed press report made public on Apr. 26, 1943, the large United States military repair base in Eritrea (see 1943 Year Book, p. 221) was being gradually dismantled and moved forward to areas hundreds of miles nearer to the fighting lines. Certain factories, mechanical shops, and harbor installations were left in Eritrea for continued use. With the completion of work on British and American bases and other projects, the British military authorities were confronted with the problem of what to do with some 30,000 Italians who had been employed on these undertakings. The Italians reportedly opposed repatriation to Italy.

ESTONIA. A Baltic republic which proclaimed its independence from Soviet Russia Feb. 24, 1918, and was reannexed by the Soviet Union as a constituent republic Aug. 6, 1940. In August-September, 1941, the Russians were driven out by German troops, which remained in occupation of the country. Capital, Tallinn.

Area and Population. Estonia has an area of 18,-359 square miles, including internal lakes, and a population estimated on Jan. 1, 1940, at 1,122,000. Estimated populations of the chief cities on Jan. 1, 1939, were: Tallinn, 144,978; Tartu, 60,281; Narva,

23,834; Pärnu, 21,886.
Religion and Education. About five-sixths of the people are Lutherans and the rest chiefly Greek Orthodox and Roman Catholics. Adult illiteracy was

slightly less than 4 per cent in 1940.

Production, etc. Before the Soviet occupation and the sovietization of the economic system, agriculture and dairying supported nearly 70 per cent of the population. The leading industrial products were cotton fabrics and yarn, wood pulp, cellulose, paper, timber, and shale oil. On Apr. 1, 1940, there were 56,456 wage earners in manufacturing plants. No trade figures were issued subsequent to the Soviet occupation. At that time Estonia had about 1,328 miles of railways, 13,416 miles of roads, and a merchant marine of 195,745 gross tons. For prewar figures on production, trade, finance, etc., see 1942 Year Book.

Government. The constitution of Jan. 1, 1938 (see YEAR BOOK for 1940 for basic provisions) was scrapped under Soviet pressure in 1940. Under threat of invasion, the Estonian Government on Sept. 29, 1939, signed a treaty of mutual assistance with the Soviet Union, giving the Russians naval and air bases on the islands of Oesel and Dagoe and at Paldiski (Baltic Port) on the mainland. The preamble of this treaty stated that it was "based on recognition of the independent state of existence and on nonintervention in the internal affairs of the other party." On June 17, 1940, this pledge was violated when Soviet troops commenced occupation of the entire republic. The government was forced to resign in favor of a pro-Soviet regime, which held elections for a parliament on July 14-15, with only the pro-Soviet slate of candidates permitted on the ballot. The new parliament petitioned the Supreme Soviet in Moscow for incorporation in the Soviet Union and on Aug. 6, 1940, Estonia became a constituent republic of the U.S.S.R. See Year Book for 1940 for a full description of this process.

Following the German conquest, Estonia was incorporated (August, 1941) as a district in the newly-created Ostland Province, with a German Nazi, Gen. Karl Litzmann, as General Commissar for Estonia. The country was subdivided into several districts, each controlled by a German District Commissar appointed by the General Commissar. A puppet administration (Directorate) of five pro-German Estonians, headed by Dr. E. Mae, was created to assist the German authorities in ruling the country. This administrative set-up was legalized and made permanent by the decree of Mar. 18 1942, issued by the Reich Minister for Occupied Territories in the East, Alfred Rosenberg. For developments during 1943, see LITHUANIA under History.

ETCHING. See ART under Prints.

ETHIOPIA. A native empire in East Africa, conquered and annexed by Italy in 1935-36 and reconquered by British Empire, Ethiopian, and allied forces in 1941. The Emperor Haile Selassie, who was driven into exile May 2, 1936, was restored to his throne in Addis Ababa, the capital, on May 5, 1941.

Area and Population. At the time of the Italian conquest, Ethiopia had an area of about 347,500 square miles and a population estimated at 5,500,-000 to 14,000,000. Under Italian rule, large Ethiopian districts were transferred to the provinces of Eritrea and Italian Somaliland (see ITALIAN EAST AFRICA in 1942 YEAR BOOK). The original Ethiopian boundaries were restored upon liberation from Italian control in 1941.

The Amharas, long the ruling race in Ethiopia, are Coptic Christians of Hamitic origin. They number less than 3,000,000. The other chief tribes are ber less than 3,000,000. The other times are the Gallas, Somalis, Afar, Arussi, Ogaden, and Danakil, which are mainly Moslem or pagan in religion. The principal languages are Amharic, Arabic, and Tigrenish. Estimated populations of the chief cities: Addis Ababa, 150,000; Harar, 50,000. 000; Dire Dawa, 30,000; Gondar, 6,000; Dessye

5,000.

Religion and Education. The Coptic Christians before the Italian invasion were subordinate to the Egyptian Coptic Church, which appointed the Abuna (head bishop). This tie was ended Dec. 1, 1937, by the Italian Viceroy, who assumed power to appoint the Coptic bishops for all Ethiopia, but the former relationship with the Egyptian Church was restored in 1942 when the exiled Abuna Qirillos returned to Addis Ababa. There are numerous priests and the Church holds a considerable proportion of the desirable land. Native elementary education is provided by over 75 government and missionary schools. There are two institutes for young Christians and Moslems, respectively, and a teachers' training school in Addis Ababa.

Defense. Under the Anglo-Ethiopian Agreement and Military Convention of Jan. 31, 1942 (see 1943 YEAR BOOK, p. 223), the British Government advanced funds and supplied a military mission headed by Maj. Gen. S. S. Butler to aid in the creation and training of an Ethiopian army. An American military mission also was in Addis Ababa. The army was equipped mainly with captured Italian arms. It was reported in 1943 to comprise infantry, artillery, engineers, a signal corps, a regiment of armored cars, and ordnance and supply services, totaling about 10,000 men. At the request of the Emperor, a British police mission undertook the organization of an Ethiopian police force.

Production, etc. Stock raising and primitive agriculture are the main occupations. Coffee, cotton, sugar cane, dates, grapes, barley, millet, wheat, and tobacco were the chief prewar crops. Coffee exports in 1938–39 were 15,000 metric tons. Considerable numbers of cattle, sheep, goats, donkeys, mules, and camels are raised. Some gold, platinum, iron, potash, and salt are produced. Hides, skins, grain, wax, and coffee were exported before the war (see 1942 Year Book, p. 295, for 1938 trade

statistics).

Finance. Previous to the Italian conquest, the Government's normal revenues were estimated at from \$5,000,000 to \$7,000,000 annually in U.S. currency, the bulk of which represented payments in kind. Upon restoration of independence, budget plans called for annual expenditures of about £2,000,000 sterling. The British Government in 1942 granted Ethiopia a two-year subvention of £2,500,000. The Maria Theresa silver dollar was supplanted by the lira as the medium of exchange during the period of Italian rule but reappeared as currency after the British military occupation, the exchange rate-being fixed at 45 lire to the dollar. Both the Maria Theresa dollar and British East African coinage were made legal tender pending introduction of a new national currency based on sterling.

Transportation. The only railway extends 487 miles from the port of Djibouti in French Somaliland to Addis Ababa. By the Franco-Italian agreement of Jan. 7, 1935, Italy obtained control of 2,500 out of the 34,000 shares in the Frenchowned railway company. In 1941 British military authorities assumed charge of the railway for the duration of the war. The Italians greatly extended the highways, which aggregated 2,730 miles in 1935. They built a network of motor roads connecting Addis Ababa with the Red Sea ports of Massaua and Assab in Eritrea, with the Indian Ocean port of Mogadiscio in Italian Somaliland, and with the principal population centers in Ethiopia. In 1943, 4,340 miles of Italian-built roads were open to traffic, of which 1,732 miles were macadamized and 1,401 miles asphalted. Airports constructed by the Italians at the chief towns and military posts were taken over by the British in 1941 for the duration of the war. A large part of the internal trade is still carried by packhorse and caravan. Addis Ababa is connected by telegraph with Massaua in Eritrea, and by telephone with Djibouti and the larger Ethiopian towns. There are telephone systems in some of the towns. Wireless is now the principal means of internal communication.

Government. Ethiopia was an absolute monarchy of the feudal type until July 16, 1931, when Emperor Haile Selassie proclaimed a unified state with two nominated assemblies to advise his Government. The first Parliament, convened in November, 1932, consisted of a Senate of 27 members chosen from hereditary chiefs of the various provinces and a Chamber of Deputies of about 40 members named by the Emperor from minor mili-

tary officers and provincial leaders. There was an Imperial Council, divided into a Supreme Council (the Emperor and two princes), a Council of Imperial Advisers (10 members), and the officers of the Court. The Emperor acted as Prime Minister. After the Emperor resumed his throne on May 5, 1941, he appointed a number of Ministers and secured the services of British experts to reorganize the political administration of the country. For 1943 developments, see below.

The Anglo-Ethiopian agreement of Jan. 31, 1942, recognized Ethiopia as a sovereign and independent state and provided for the resumption of diplomatic relations. However certain areas adjoining French Somaliland and the whole of the Addis Ababa-Djibouti railway and its properties were "reserved" under temporary British military administration. On Oct. 9, 1942, the Ethiopian Government adhered to the United Nations Declaration of Jan. 1, 1942, and on December 1 it declared war on Italy, Germany, and Japan. See History for 1943

developments.

History. Little news of developments in Ethiopia penetrated through the censorship during 1943. However the United Press sent out from Addis Ababa on August 3 a statement by Emperor Haile Selassie upon the resignation of Premier Mussolini in Italy. Pointing out that Mussolini "was the first to introduce banditry methods into present-day European politics," he said Il Duce's "crimes have been as heavy as those of Hitler." The Emperor said that inasmuch as Mussolini had not hesitated to use poison gas against defenseless people (in Ethiopia) and to order "the wholesale massacre of an innocent population," he should not be permitted to end his days in safe retirement. However he declared that "Ethiopia is less interested in vengeance for the past than in justice for the future. . . . It is much more important to Ethiopia to be given the opportunity to share in the building and maintaining of international institutions that will prevent the rise of political bullies trampling on the rights of small nations . . . Mussolini's downfall only clears a path for the forces of justice to emerge. In itself it is not the guarantee that justice has triumphed. . . ."

justice has triumphed. . . ."

On October 16 the Emperor cabled the London News Chronicle that he would refuse to recognize Italy as a co-belligerent of the United Nations. A few days later correspondents with the British Eighth Army in Italy reported that Prince Emerou (Imeru), a cousin of the Emperor who was captured in Western Ethiopia in December, 1936, had been released with his retinue of 16 followers after seven years' internment in Calabria Province. The British placed a plane at the Prince's disposal to

return to Ethiopia.

Toward the end of the summer, Lord Moyne, British Assistant Minister of State in the Middle East, visited Addis Ababa for conferences with the Emperor. The subjects under discussion were not revealed, but it was taken for granted that they were concerned with the extension of the two-year Anglo-Ethiopian agreement of Jan. 31, 1942, which was due to expire at the end of January, 1944.

was due to expire at the end of January, 1944.

The Emperor's Vice Minister of Finance, Yilma Deressa, went to the United States to attend the United Nations food conference at Hot Springs, Va., in May-June. He remained to conduct negotiations on lend-lease and other matters with the State Department. On August 9 Deressa and Secretary Hull signed a mutual-aid agreement under which the U.S. Government agreed to continue to provide Ethiopia with lend-lease supplies and services in return for reciprocal aid.

Some light on internal developments in Ethiopia was shed by Deressa in an interview published in The New York Times of June 20. He said that the Emperor had instituted many reforms, including the abolition of toll gates and of the medieval system of taxation, and modernization of the legal system. Government had been centralized and a program of public health education organized. The emissary pointed out that many difficult problems remained. The Italians had "deliberately massacred" the small Ethiopian intelligentsia. The native economic and social system was disorganized by the war. Italian punitive expeditions had left many natives homeless and caused serious dislocations of populations. He said Ethiopia hoped to engage American engineers to build roads and there was urgent need for more teachers, books, and stationery. See WORLD WAR.

EVANGELICAL AND REFORMED CHURCH, The. A denomination formed by the merger in Cleveland, Ohio, on June 26, 1934, of the Evangelical Synod of North America and the Reformed Church in the United States. The highest judicatory is the General Synod, which meets biennially. A new Constitution was declared in effect at the meeting of the General Synod, held at Lancaster, Pa., in 1940. In 1942 a new Book of Worship and Hymnal were formally adopted by the General Synod while in session at Cincinnati, Ohio. The officers of the Evangelical and Reformed Church are: President, Rev. Dr. L. W. Goebel, 77 W. Washington St., Chicago, Ill.; First Vice-President, Rev. Dr. George W. Richards; Second Vice-President, Hon. D. J. Carden, Second St., E. J., William E. L., and D. William E. L., Snyder; Secretary, Rev. Dr. William E. Lampe, 1505 Race St., Philadelphia, Pa.; Treasurer, Mr. F. A. Keck.

In its combined statistics for the year 1942, the Evangelical and Reformed Church reports a membership of 665,920 in 2,845 congregations. Total expenditures for congregational purposes amounted to \$9,508,482, and total benevolences to \$1,734,-321. The Sunday School enrollment is 468,737.

EXPORT-IMPORT BANK OF WASHINGTON (EIB). A U.S. agency created Feb. 12, 1934, for the purpose of financing and facilitating trade between the United States, its territories, insular possessions, and for-eign countries. By an act approved Jan. 31, 1935, and amended from time to time, the Bank will be continued as an agency of the United States until Jan. 22, 1947, or such earlier date as may be fixed by the President. The latest amendment authorized the Bank to use not more than \$500,000,000 outstanding at any one time for loans to assist in the development of the resources, the stabilization of the economies, and the orderly marketing of the products of the countries of the Western Hemi-sphere. The Bank has a total lending authority of \$700,000,000.

From its creation to the end of 1943, the Bank had authorized \$1,164,948,061 of loans compared with \$1,101,761,946 at the close of 1942. During the year 1943, disbursements amounted to \$55,-687,885 and repayments to \$32,250,352. As a result, outstanding loans at the end of 1943 were \$204,937,874 compared with \$181,500,341 at the

end of the previous year.

Although the operations of the Bank in behalf of United States foreign trade have been worldwide, circumstances have restricted them since the outbreak of war almost entirely to the Western Hemisphere and particularly to the making of loans to develop resources vital to the war effort. Because of transportation difficulties and other wartime impediments to foreign trade, the Bank continued during 1943 its plan for underwriting letters of credit of approved foreign banks which are opened in this country by United States commercial banks, thus helping to preserve long-established markets and trade channels to the extent possible under wartime conditions.

FAEROES. A group of 21 islands (the chief being Bordö, Kalsö, Österö, Sandö, Strömö, Suderö, Vaagö, and Viderö) north of Scotland, forming a county of Denmark, but under British military control since Apr. 10, 1940. Total area, 540 square miles. Population (1935 census), 25,744. Capital, Thorshavn (on Strömö), 3,611 inhabitants. The chief exports are fish, whale oil, woolen goods, lambskins, and feathers. The islands are administered by a Danish governor and the local parliament (Lagting).

FAIR EMPLOYMENT PRACTICE, Committee on. Originally a Committee established by executive order within the Office of Production Management (see YEAR BOOK for 1941) on June 25, 1941, and transferred to the War Manpower Commission on July 30, 1942. This Committee ceased to exist upon the establishment of a new Committee on Fair Employment Practice within the Office for Emergency

Management on May 27, 1943.
The purpose of the Committee is to promote the fullest utilization of all available manpower and to eliminate discriminatory employment practices. Executive Order 9346, by which it was established, provided that all agencies of the U.S. government include in all contracts a provision obligating the contractor not to discriminate against any employee or applicant because of race, creed, color, or national origin. Federal agencies concerned with training for war production were required to assure that such programs are administered without discrimination. The Committee is empowered to receive and investigate complaints of discrimination, to conduct hearings, make finding of fact, and take appropriate steps to obtain elimination of such discrimination. Chairman: Malcolm Ross.

FALANGE ESPAÑOLA. See ARGENTINA and SPAIN under History.

FALK FOUNDATION. See PHILANTHROPY under Foundation Activities.

FALKLAND ISLANDS. A British crown colony in the South Atlantic, 480 miles northeast of Cape Horn, South America. Area, 4,618 square miles. Population (1941), 2,433. Capital: Stanley (on East Falkland), had 1,246 inhabitants. The chief occupation of the people is sheep farming. In 1941 there were 623,977 sheep in the colony. Oats and potatoes are grown in small quantities. Trade (1940): imports £146,438; exports £199,381. The main imports included groceries, hardware and machinery, coal, coke, and oil; exports comprised wool (3,903,-289 lb., valued at £183,400), seal oil (12,600 barrels, £50,428), sheepskins and hides (£9,700), livestock, and tallow. Shipping entered (1941): 75 vessels aggregating 90,570 tons. The colony is administered by a Governor, assisted by an executive council, and a legislative council. Governor and Commander in Chief, Allan Wolsey Cardinall (appointed Feb. 8, 1941).

Dependencies. These comprise all islands and territories between 20° and 50° W., south of 50° S., and between 50° and 80° W., south of 58° S. The main land divisions are South Georgia (1,450 sq. mi.; pop., 360, including 7 females, in 1940), South Shetlands, South Orkneys, South Sandwich Islands, and Graham Land. The principal industry is whaling. Guano output in 1940 totaled 6,586 metric tons. Sealing operations are carried out. Reindeer have been introduced and are thriving. Trade (1940): imports £124,487; exports £103,-620. The administrative authority is vested in the governor and the executive and legislative councils

of the Falkland Islands.

History. Military forces from overseas were sent to the islands after Japan entered the war. Stanley became an armed camp and the local Defence Force was merged with the garrison.

FASHION EVENTS. Government stepped forward as chief fashion designer. Order L85, devised to save material and labor, actually launched a fashion that will long be remembered as admirable. For L85 narrowed the silhouette to a lean, sure line, banished furbelows and excrescences, encouraged simplicity with confidence behind it. The result was that look of elegance always characteristic of the costumes of the best couturiers—a look born of understatement. There were no better dressed women in the land than the WACs, the WAVES, and the SPARS, and other women strived to copy their trim suits, their scrubbed, clean grooming, their casual but truly glorious posture. These facts held true regardless of whether a woman spent \$16.95 for a suit or \$175 for a dress. The only real difference existed in the quality of material used and whether it was ready-made or custom-made.

The leading fashions were: suits and workers' uniforms; the straight chemise dress with natural shoulder and normal waistline; the narrow simple shoe; the plumb-line skirt; blouses, accessories, and jewelry in which fancy was allowed full play. These simple styles helped the pattern industry. More than 75,000,000 home-sewing patterns were bought, a total never before reached. Home-sewing centers were opened in many department stores

and were well attended.

Textiles saw wool and rayon take the lead with cotton a desired but surprising best seller through the summer months. Lamé enjoyed a spurt in sales when fall came round. No one color was given preference as the Covernment warned that such an up-swing would cause a shortage. Every color was good so long as it was bright. In fact the sudden surge to bright colors which started this year seems destined to continue. The courage to buy, mix, match, and harmonize colors has resulted in a discovery of color with its prairies and the surgest that the sur covery of color with its excitement, its happy charm, its possibilities, that will continue and affect most of the things women buy for several years to

For daytime wear, suits, chemise-dresses, and workers' clothes were the uniforms of all women out of service. Evening saw them in a fashion that was brief and bare—low-cut with short skirt and cap-sleeve. Long evening clothes were seldom worn though the very young still clung to their bouffant skirts. However, for very formal and special occasions fashion borrowed an idea from the most chic, most charming and accomplished diplomat of the many who visited the United States this year-Madame Chiang Kai-shek. Her straight, sheath-line gowns were copied for long skirts in a costume made in both one-piece and two-piece models.

Coty, a leading parfumeur, instituted a fashion award for American designers. The bronze figure known as "Winnie" was sculptured by Malvina Hoffman. Judges of the contest were Edna Woolman Chare, Editor-in-chief of Vogue, William Church Osborn, Grover A. Whalen, and 34 fashion editors. Mayor LaGuardia of New York officiated when the award was made. "Winnie" was presented along with a \$1,000 War Bond to Norman Norell of Traina-Norell. Tying for second place were Lilly Daché and John Fredericks, hat designers. Eight citations were made: Adrian of Hollywood for his V-line suit; Hattie Carnegie for her short evening dress; Clare Potter for her ruffled blouse; Charles Cooper for his drawstring drapery; Mainbocher for his lumber-jacket suit; Clare McCardell for her "Popover" dress; Valentina for her trouser-pressed skirt.

Coats resolved themselves into two groups, the Chesterfield and the Tuxedo. The novel innovation was the sudden popularity of fur-lined coats, which appeared in both models. Fur coats enjoyed unprecedented sales with the chief preference being for mink, Persian lamb, opossum, and beaver, with summer emine entering the fashion picture

more importantly than in years.

During the spring, hats tended toward the diminutive Homburg and the calotte, while an effort (not too successful) was made to revive the cloche. These same styles returned in the fall together with small hats with a forward, lifted line, like the antenna of an insect. During the summer, hats touched two extremes—from huge cartwheels to a mere bunch of flowers or feathers—and very often were not worn at all.

The rationing of shoes, the elimination of many colors in gloves, and declining stocks in hand-bags caused the accessory picture to be one of ingenuity rather than of rule. Somehow women managed to

keep them bright, interesting, decorative.

But unquestionably the surprise of the fashion world was the demand for precious jewelry. This outreached any figure known before, despite the fact that every sale incurred a ten per cent excise tax. Diamond solitaires from one-half carat to ten carats, watches of gold set with diamonds and precious stones, clips and pins of diamonds, sapphires, and rubies were purchased in department stores and in the exclusive jewelry shops. Design and fine craftsmanship, together with the fact that New York became a diamond center that rivaled London and Amsterdam in their palmiest days, were contributing factors to this vogue for jewels. But above all money was plentiful, costumes were plain, and the American man is generous.

Along with the demand for luxuries the cosmetic business found its sales soaring to new heights. Perfume and sachet enjoyed a banner year. Creams, lotions, face powders, lip-sticks, and rouge gained thousands of new users as incomes mounted in the lower brackets. Liquid stockings were more in demand during the summer months than ever before. Hand creams and lotions were demanded by workers eager to offset the effects of days at the machines. Beauty shops were installed in war production plants as a means of preventing absenteeism.

tion plants as a means of preventing absenteeism. The fashion magazines were crowded with advertising, with paper rationed as pulp stocks declined. Stores ceased to present specific models in their advertising because they lacked stock to supply such stimulated demand. Many used space hitherto reserved for fashions for institutional advertising. Despite OPA rulings prices soared but customers bought gratefully. More and more substitutes appeared on the shelves. By the end of the

year surplus stocks of both manufacturer and retailer had dwindled to alarming depths and the new year came without the most optimistic or pessimistic prophet willing to discuss future fashion events.

FEDERAL BUREAU OF INVESTIGATION (FBI). Although having greater responsibilities than ever before in its history, the Federal Bureau of Investigation was successful in the fiscal year 1943 in carrying out its primary responsibility of protecting the home front against spies, saboteurs, and subversive agents. The FBI's counterespionage and countersabotage programs were vigorously maintained throughout the fiscal period and the measure of success achieved can be gauged by the thwarting of foreign espionage plans and the complete absence of foreign-directed sabotage.

Among the numerous protective measures utilized during the year were Paneling Boards composed of representatives of the FBI and the Intelligence Services of the Army and Navy at ports of air or sea entry. The thorough questioning of persons entering and leaving the United States proved a most effective barrier for those attempting to engage in activities harmful to the Nation's

security

Highlighting the activities of the year was the culmination of the case involving the eight submarine-landed German sabotage agents, six of whom were executed while the other two received sentences of life and thirty years in prison,

respectively.

During the fiscal year 1943 local, city, county, and State law enforcement officers were most coperative and proved of invaluable service to the FBI in the discharge of its duties. Individual citizens and patriotic and civic groups continued their commendable aid to the FBI during the year. These contributions were clearly recognized by the President of the United States on Jan. 8, 1943, when he reiterated his directive of Sept. 6, 1939, calling upon all citizens to report any information relating to espionage, counterespionage, sabotage, subversive activities, and violations of the neutrality laws to the FBI.

Continuing its Mobilization Plan for law enforcement officers, the FBI conducted 1,604 Conferences during the fiscal year 1943, representing nearly 10,000 different local, city, and county law enforcement agencies. These Conferences were attended by 149,119 law enforcement officers.

The fiscal year 1943 saw the continuance of a very close cooperative relationship between the FBI and other Federal agencies on security matters. Weekly conferences between the Intelligence Services of the Army and Navy and the FBI for the mutual exchange of data and the over-all coordination of intelligence activities on a nation-

wide basis were held.

The fiscal year ending June 30, 1943, saw the FBI and cooperating law enforcement agencies continuing a rigorous enforcement of the alien enemy program in accordance with the Presidential Directive. As the year ended a total of 14,432 alien enemies had been apprehended since the outbreak of war on Dec. 7, 1941. Of this number 5,027 were taken into custody during the fiscal year ending June 30, 1943. In carrying out the responsibilities, 24,662 premises and dwellings of alien enemies were searched for contraband materials by the FBI and assisting local law enforcement agencies.

The counterespionage program of the FBI has brought enemy espionage within the United States under control. During the fiscal year 1943 there were 28 convictions for espionage or for failure to register as foreign agents and sentences totaling 255 years were imposed. Other cases were under investigation and several prosecutions were pend-

ing as the year ended.

Although there was a substantial increase in the number of cases of suspected sabotage during the fiscal year 1943, there was no evidence of any foreign-directed sabotage. During this year 90 convictions resulted from prosecutions in Federal courts in sabotage cases investigated by the FBI. Sentences imposed totaled 287 years and 6 months, I life and 6 deaths, with fines of \$31,004.

Meticulous attention was given to the investigation of sedition cases by the FBI during the fiscal year 1943; 29 convictions with sentences aggregating 146 years and 1 day were imposed under these statutes. As the year ended, a total of 1,094 cases had been investigated, and 42 individuals and 1 corporation were under indictment and

awaiting trial.

Adhering to its policy of avoiding mass arrests and "slacker raids," the FBI continued its investigations of violations of the Selective Training and Service Act. Convictions for the fiscal year 1943 totaled 3,071 while sentences aggregated 7,542 years, 2 months, 29 days, and fines amounting to \$478,001 were imposed. Since the registration date on Oct. 16, 1940, the FBI has closed a total of 204,519 cases involving matters pertaining to vio-lations of the Selective Training and Service Act. As a result of its investigative activities, 7,054 men were inducted, 88,444 registrants were located and complied with the Act, and 5,455 men registered.

With the accent on war production, an increase in the number of cases involving war frauds of various types took place during the fiscal year 1943. Among the cases handled by the FBI were violations of the Servicemen's Dependents Allowance Act of 1942, the Kickback Racket Act, and numerous schemes to defraud the government, such as the use of inferior materials, collusive bidding, careless or wilful evasion of proper inspection procedures, and illegal and excessive commissions. Continuous attention was afforded investigations of this nature by the FBI, and during the year 66 convictions, with sentences of 93 years, 8 months, 2 days, and fines, savings, and recoveries of \$164,-484, were recorded.

The wartime responsibilities of the FBI also included inquiries concerning the loyalty of designated aliens employed on war contracts, violations of the Export Control Act regulating the exportation of critical and strategic materials from the

United States, violations of the Presidential Proclamation of July 17, 1941, pertaining to dealing with individuals and organizations commonly referred to as being on the "Proclaimed List of Certain Blocked Nationals." Attention was also given to matters pertaining to alien registration, Visa Control, Exit and Reentry Control, and to checking the names of American seamen applying for passports to sail in foreign commerce.

Regular Criminal Investigative Activities. The FBI continued to meet the responsibilities imposed upon it by regular criminal statutes. From the passage of the Federal Extortion Act on July 8, 1932, to June 30, 1943, 890 convictions in Federal courts resulted from investigations by the FBI. Sentences totaling 3,775 years, 5 months, and 5

days were imposed.

In the fiscal year 1943 there were 71 convictions from prosecutions in Federal courts, with sentences

totaling 218 years, 10 months, and 10 days, and fines amounting to \$2,430 were recorded.

During the fiscal year 1943, 92 convictions in Federal courts for bank robbery, larceny, and burners, but to be a superscript of the glary were recorded, and sentences totaling 725 years, 2 months, and 10 days were imposed. Sixtyone fugitive bank robbers were located and re-coveries amounting to \$30,617 were effected.

Twenty-nine kidnaping cases occurred and all were solved during the fiscal year 1943. Fortyseven convictions resulting from the investigative work of the FBI were effected and sentences totaling 461 years, 10 months, and 3 days were recorded. Since the passage of the Federal Kidnaping Act on June 22, 1932, 254 cases of kidnaping and conspiracy to kidnap have been investigated by the FBI, and only two of these cases remain unsolved. There were no cases of kidnaping during the fiscal year 1943 involving payment of ransom.

Irregularities in national banks, member banks of the Federal Reserve System, and banks insured by the Federal Deposit Insurance Corporation exceeding \$3,700,000 were reported to the FBI for investigation during the fiscal year 1943; 222 convictions resulted from the prosecutions in Federal courts. Sentences imposed totaled 781 years, 8 months, and 2 days, while fines and recoveries amounted to \$334,514.

Since the passage of the National Motor Vehicle Theft Act making it a Federal offense to transport a stolen vehicle in interstate commerce, 72,106 motor vehicles valued at \$40,814,782 were recovered in cases investigated by the FBI. In the fiscal year 1943 a total of 2,171 convictions resulted from prosecutions under this act in Federal courts. Sentences aggregating 6,410 years, 3 months, and 27 days were imposed. Fines amounting to \$8,671 were assessed and 745 fugitives from justice were located.

Violations of the various Federal statutes relating to the theft, embezzlement, and illegal possession of government property in view of the war situation were given particular and vigorous investigative attention by the FBI. A total of 634 convictions resulted from prosecutions in Federal courts. Sentences totaling 1,139 years, 2 months, and 9 days were recorded, while fines, savings, and recoveries amounted to \$67,099.

In view of the increased movement of war materials over various transportation systems, investigations of violations pertaining to thefts from interstate shipments increased substantially; 333 convictions were recorded in Federal courts during the fiscal year 1943 and sentences totaling 837 years and 11 months were imposed; fines and recoveries amounted to \$20,649.

The FBI concentrated its attention on violations involving the White Slave Traffic Act and the May Act. The latter regulation prohibits prostitution and related crimes in the vicinity of military and naval establishments when its provisions are invoked by the military authorities. A total of 1,086 convictions with sentences totaling 2,129 years, 6 months, and 45 days was recorded during the fiscal year 1943 and fines amounting to \$94,252 were assessed.

Numerous other violations of statutes within the investigative jurisdiction of the FBI received attention during the fiscal year 1943. Several extensive lottery syndicates engaged in nationwide dis-tribution of lottery tickets were successfully prosecuted and a total of 144 convictions were noted.

There were 36 convictions for Crimes on the High Seas, 379 convictions for crimes on Indian and Government reservations, 52 convictions for violations of the National Firearms and Federal Firearms Acts, and 746 convictions for violations of the Impersonation and Illegal Wearing of the Uniform Statutes. Certain civil matters such as War Risk Insurance claims, applications for executive clemency of persons previously convicted of felonies in Federal courts, and Court of Claims matters were also handled. In the latter classifi-cation savings and recoveries of \$22,079,414 were realized.

The Identification Division of the FBI, which was established in 1924 with 810,188 fingerprint was established in 1924 with 510,100 ingerprint cards, experienced its greatest growth and service to law enforcement, the armed forces, war industries, governmental organizations, and law-abiding citizens during the fiscal year 1943. Averaging a receipt of 93,540 sets of fingerprint cards daily, 69,644,540 fingerprint cards were on file on June 30, 1943. The rapid growth of this section of the FBI necessitated its transfer from the Departthe FBI necessitated its transfer from the Department of Justice Building to greater quarters in the National Guard Armory in the District of Columbia. The identification of mangled bodies in airplane crashes, drowned seamen washed ashore, and victims of other catastrophes demonstrated the infallibility of fingerprinting as a means of identification.

The achievements of the FBI Laboratory for the fiscal year 1943 surpassed those of any previous year. A total of 193,871 examinations involving 247,886 individual specimens of evidence was conducted by Laboratory technicians, the major part of which was directly concerned with the nation's war program.

The FBI National Police Academy continued its service to law enforcement during the fiscal year 1943. Three sessions were held and 113 police officers from various parts of the country and Canada graduated from this school. As of June 30, 1943, there were 740 men who had received the benefits of this training to the service of approximately 100,000 local law enforcement officers.

J. EDGAR HOOVER.

FEDERAL COMMUNICATIONS COMMISSION (FCC). The regulatory agency of the Federal Government for interstate and foreign communications by wire and radio during 1943 devoted an increasing portion of its time to communications problems arising out of the war. The FCC cooperates closely with the Board of War Communications, established by Executive Order in September, 1940, and the FCC Chairman is also Chairman of the Board.

An important war service is rendered by the Commission's Radio Intelligence Division, set up in July, 1940. Engineers in this Division maintain

a round-the-clock patrol of the radio spectrum to guard against its use for illegal or subversive purposes. A continuous watch is maintained for Fifth Column radio transmitters which might attempt to contact Axis agents abroad or aboard submarines lying well offshore. RID also traces sources of interference to military and commercial radio broadcasts, enforces wartime regulations to insure safe communications, and through highly sensitive radio direction-finding equipment assists ships and planes in distress. To do this work, RID operates a net of 12 primary monitoring stations, 79 secondary stations strategically located throughout the United States and its possessions; three intelligence centers in Honolulu, San Francisco, and Washington, D.C.; and 90 mobile patrol units, some 30 of which cruise the 5,000 mile shoreline of our Atlantic, Gulf, and Pacific Coasts keeping special watch for illegal ship-to-shore radio signals. During the fiscal year 1943, 3,960 cases of illegal radio operation were investigated by RID engi-

The Commission's Foreign Broadcast Intelligence Service has the job of keeping Government agencies informed of the content of foreign radio broadcasts as an aid in mapping foreign policy and countering enemy propaganda. At year end, FBIS was surveying 2,500,000 words a day of foreign broadcast material in 35 languages and dialects. At five powerful listening posts FBIS monitors were intercepting broadcasts from all parts of the world. During the year cooperative arrangements were completed with the Office of War Information. tion, the British Ministry of Information, the British Broadcasting Corporation, and listening posts of other friendly nations for coverage and transmission to FBIS of foreign broadcast material not well heard in this country. In the form of minute-by-minute bulletins over FBIS wire services, of daily reports, and weekly analyses, selected items from the vast amount of material monitored are sent on to some 1,000 officials of this government and to representatives of the United Nations. Considerable information obtained from foreign broadcasts is released to the press through the Office of War Information.

Other Commission war activities in 1943 included: A comprehensive "security" survey by engineers in the Security Section (set up October, 1942) of international radiotelegraph, radiotele-phone stations, key broadcast stations, cable properties and the more important offices of the Bell Telephone System; a survey of domestic foreign-language programs; a catalogue of surplus and salvageable broadcast equipment for use by the miliof War Communications (q.v.) on the speed and adequacy of wartime telegraph service; and frequency allocation studies for the State, War, and Navy Departments.

To prolong the life of radio equipment without noticeable effect on the broadcast signal, FCC Order 107 (November, 1942) required readjustments of broadcast transmitters decreasing radiated power by one decibel. During the year the Commission authorized a voluntary reduction in time of operation of standard broadcast stations from 12 hours, in the case of unlimited time stations,

to six hours a day.

Relaxing somewhat its wartime "freeze" on the use of manpower and materials in the construction of civilian radio facilities, the FCC in August, 1943, announced that it would authorize construc-tion involving the use of *idle* equipment to increase the power of 100-watt local channel standard broadcast stations to 250 watts and for construction of new local channel stations in communities where no radio station is now located (excluding those communities located in metropolitan districts already receiving radio service). Multiple ownership of standard radio broadcast stations serving substantially the same area was banned November, 1943, and in December the license period of standard broadcast stations was extended from two to three years, maximum statutory limit under the Communications Act.

In the telephone field, the largest single rate investigation of the year terminated when the FCC announced January, 1943, that the American Telephone and Telegraph Long Lines Department had agreed to a reduction in the rate for interstate and private line services which will result in a saving to the public of upwards of \$34,700,000 annually.

Most important development in the telegraph industry was the merger of Western Union and Postal Telegraph, Inc., the two major domestic competing telegraph carriers. This integration was authorized in permissive legislation by Congress March, 1943, and after extensive hearings from July through September, the Commission approved the merger plan of the two companies Sept. 27, 1943.

The Supreme Court handed down two important decisions in the field of radio. The cases of National Broadcasting Company v. United States and the Columbia Broadcasting System v. United States, both of which were decided in favor of the FCC, May 10, 1943, represented the last phase of litigation challenging the validity of the chain broadcasting regulations. These "antimonopoly" regulations are designed to foster competition in network broadcasting, to eliminate restraints imposed by networks on affiliated stations, and to expand "listening" opportunities of radio audiences.

In Federal Communications Commission v. National Broadcasting Company (KOA), the Supreme Court on May 17, 1943, affirmed the District Court of Appeals' decision favoring KOA. The Court held that a Class I station licensee was entitled to intervene in proceedings on an application which, if granted, would permit night-time operation of another station on the channel occu-

pied by the Class I licensee.

During the year two bills were introduced, one each in the Senate (S. 814) and House (H.R. 1490) to amend substantially the Communications Act of 1934 under which the FCC operates. Hearings on the Senate bill were held in November and December, 1943, before the Interstate Commerce Committee. No hearings have yet been called on H.R. 1490.

Present members of the Commission are James Lawrence Fly, Chairman; Paul A. Walker, Norman S. Case, T. A. M. Craven, Ray C. Wakefield, and Clifford J. Durr.

See Law under Supervision of Federal Agencies. See also COMMUNICATIONS, ELECTRICAL, and separate article on WAR COMMUNICATIONS, BOARD OF.

FEDERAL COUNCIL OF THE CHURCHES OF CHRIST IN AMERICA. An organization established in 1908 by 28 Protestant denominations to act for them in matters of common interest. At the end of 1943 it included most of the major Protestant denominations of the United States and also two branches of the Eastern Orthodox family. The total number of members included in the Council's constituency in 1943 was 25,551,560.

The program of 1943 was marked by a strong emphasis on the tasks created by the war. The Commission on Army and Navy Chaplains carried on its work in Washington, D.C. The Commission on Camp and Defense Communities, with the collaboration of the Home Missions Council, assisted the churches facing enlarged responsibilities because of their proximity to camps or new wartime industries. A Committee on Conscientious Objecchurches in the men rendering their "work of national importance" in civilian camps. A Committee on Overseas Relief and Reconstruction, with the collaboration of the Foreign Missions Conference, coordinated the efforts in behalf of refugees, prisoners of war, the suffering in China, children in unoccupied France, missionaries cut off from their normal bases of support. It also inaugurated a plan for united assistance to the churches of Europe after the war. A Commission on Aliens, with special reference to interned aliens in America, was established after the United States entered the war. It launched a program for resettling Japanese-Americans in new homes through the cooperation of local churches. The Commission to Study the Bases of a Just and Durable Peace in March, 1943, issued a statement, popularly known as "Six Pillars of Peace," which has been widely accepted as a platform of postwar objectives. Collaboration with the United Service Organizations (q.v.) was a major aspect of service.

A new Commission on the Church and Minority Peoples was created during the year with a view to strengthening the influence of the cooperating churches in promoting a greater unity among the diverse groups that make up the American com-

The Council continued the National Christian Mission especially in military camps, with the cooperation of army and navy chaplains. Interdenominational conferences on family life, on religion and health, on Christian social work, on interracial cooperation, and on public worship were held in the different regions of the nation. Ten religious programs over national radio networks were presented each week throughout the year. Information Service was published weekly as an analysis of social, international, and internacial problems of special interest to the churches and the Federal Council Bulletin as the official organ of the Council.

Officers in 1943 were: President, Rt. Rev. Henry St. George Tucker; vice-president, Dr. J. McDow-ell Richards; treasurer, Harper Sibley. The general secretary is the Rev. Samuel McCrea Cavert. National offices are at 297 Fourth Avenue, New York City. An office is maintained in the Woodward

Building, Washington, D.C.

FEDERAL DEPOSIT INSURANCE CORPORATION (FDIC). An independent agency of the U.S. Government, organized under the Banking Act of 1933 to insure the deposits of all banks which are entitled to the benefits of insurance under the law. The major functions of the Corporation are to pay off the depositors of insured banks closed without adequate provision having been made to pay claims of their depositors, to act as receiver for all sus-pended national banks and for suspended State banks when appointed by State authorities, and to prevent the continuance or development of unsafe and unsound banking practices. The Corporation may also make loans to or purchase assets from the insured banks when the the insured banks when such loans or purchases will facilitate a merger or consolidation and will reduce the probable loss to the Corporation. Chairman in 1943, Leo T. Crowley. See Banks and BANKING.

FEDERAL HOME LOAN BANKS. See National Housing Agency; Reconstruction Finance Corporation.

FEDERAL HOUSING ADMINISTRATION (FHA). See NATIONAL HOUSING AGENCY.

FEDERAL POWER COMMISSION. An independent agency of the U.S. Government, first established in 1920, which has jurisdiction over water power projects on navigable streams or affecting interstate or foreign commerce, or upon public lands, and over the interstate movement of electric energy. It also regulates the transportation or sale of natural gas in interstate commerce under the Natural Gas Act. Chairman in 1943: Leland Olds. See Electric Light and Power; Law under Supervision of Federal Agencies.

FEDERAL PUBLIC HOUSING AUTHORITY (FPHA). See National Housing Agency.

FEDERAL RECREATION BUILDINGS. See FEDERAL SECURITY AGENCY.

FEDERAL RESERVE SYSTEM. An agency of the U.S. Government established in 1913 for more effective supervision of banking in the United States and for other purposes. The System comprises the Board of Governors; the Federal Open Market Committee; the 12 Federal Reserve Banks and their branches situated in different sections of the United States; the Federal Advisory Council; and the member banks, which include all national banks in the United States and such State banks and trust companies as have voluntarily applied to the Board of Governors for membership and have been admitted to the System. Chairman in 1943: Marriner S. Eccles. See Banks and Banking; Business Review.

FEDERAL SAVINGS AND LOAN INSURANCE CORPORATION. See National Housing Agency.

FEDERAL SECURITY AGENCY (FSA). An agency of the U.S. Government which was established July 1, 1939, as a result of the Reorganization Act passed by the Congress earlier in that year, to promote "social and economic security, educational opportunity, and the health of the citizens of the nation." It brings together Government agencies having related responsibilities in these broad fields. As the Agency is presently constituted, its component units are the Public Health Service, under which is Freedmen's Hospital; the Office of Education; the Social Security Board; the Food and Drug Administration; the Office of Vocational Rehabilitation; and Saint Elizabeths Hospital. It also represents Federal participation in the work of Howard University, the Columbia Institution for the Deaf, and the American Printing House for the Blind. (See separate articles on the first five of the component agencies.)

Since the beginning of the national defense program, the need for maintaining essential health and welfare services in wartime has been recognized. Because of the close relationship between this emergency need and the continuing programs of the Federal Security Agency, the Federal Security Administrator was appointed by the President, in November, 1940, to direct the coordination of services in this sector of national mobilization. This function, carried out through the Office of Defense Health and Welfare Services from September, 1941, was transferred to the Federal Security Agency by an Executive Order in April, 1943. Under this order, the Office of Community

War Services was established as an integral part of the Agency, as was a Committee on Physical Fitness.

Office of Community War Services. This office serves as a correlating center for health and welfare activities both within the Federal Security Agency and in other Federal and private national organizations. Throughout the country it works through State administrative agencies and with State and local defense councils and other community planning groups to stimulate the development of local health and welfare activities related to the war.

For recreation, social protection, and, during a limited period, for day care for children of working mothers—fields where national war programs were needed—the Federal Security Agency, through the Office of Community War Services, assumed direct responsibility. In these programs it aided hard-pressed communities in war areas to develop effective local services and helped them take advantage of all the facilities available through national and State, as well as local, agencies.

The Division of Recreation is concerned with the organization of community leisure-time activities for members of the armed forces on leave and for the civilian population in war-area communities. Its purpose is to maintain and strengthen morale, to promote mental and physical health and well being, to speed war production, to safeguard the health of children and young people.

In carrying out its program, the Division works with established agencies, encouraging the initiative and local responsibility of communities, counties, and States. Operation of the program is carried out through a staff of field representatives. Working in 2,462 cities and towns during the past two years, recreation specialists have stimulated and implemented community action on recreation needs for service men, war workers and their families, and youth. When communities are unable to do the whole job without jeopardy to their financial structure, the Division seeks supplementary assistance for them from the Federal Government and national private agencies, sees that the funds are used to achieve a good distribution of services and assists in maintaining the quality of service.

To get the job done, the Division, as of June 30, 1943, had organized more than 1,200 local War Recreation Committees, widely representative of civic, professional, fraternal, labor, and religious groups. In addition, 207 area, county, and State organizations have been established to bring to bear on local problems the counsel and resources

of geographically larger groups.

The procedure in field operation varies with the problem and the development of the program, although the approach follows a basic pattern: in anticipation of a local problem, or at the request of the Army, the Navy, the War Manpower Com-mission, State, or community officials, the field representative comes to the town; after discussing the situation with the Mayor and civic leaders, he makes a careful study of available resources, assesses the problems and presents the findings and recommendations at a meeting of all groups concerned. To assume responsibility for the tasks indicated, to do over-all community planning and supervision, to raise money and allocate it, a local War Recreation Committee is usually formed. Within its framework will be subcommittees concerned with the needs of service men, war workers, and youth.

To serve the 1,341 Army posts, camps, and stations and the 350 major Naval establishments in

the continental United States, the Division had helped in setting up 2,555 service men's centers as of July 1, 1943. Of these, 1,514 are operated by local communities or established local agencies, and 1,041 by the United Service Organizations (q.v.). In cooperation with the Army and Navy, 53 overseas recreation programs had been established in ten territorial possessions and foreign nations, other than in combat areas, where concentrations of American armed forces are stationed.

In the 1,476 counties with war plants, field representatives have helped to establish 742 centers and outdoor areas for war workers and their families. The United Service Organizations manage 184 of these, and communities, using either local or Federal funds, or both, operate 608. Additional service is being rendered war workers and families in 704 public and private housing projects by the promotion of full use of recreation facilities; by setting up tenant associations; integrating newcomers into the community; by assisting in selection of professional personnel; by initiating volunteer training courses; and by aiding in programming. Plant management, realizing that workers are less likely to stay on a job or in a town that does not provide minimum recreation opportunities, is likewise requesting the assistance of field representatives.

To certify to the Federal Works Agency the need for the 295 Federal Recreation Buildings constructed as of June, 1943, at a cost of 25 million dollars, comprehensive community studies were made by the Division. As of July 1, 1943, 144 additional War Public Works facilities involving either new buildings or renovations were in process of construction or final approval. Similar community studies have been necessary to certify to the need for 140 War Public Service projects granted as of June, 1943, involving the allotment of Federal funds for the maintenance and operation of recreation programs by communities in behalf of enlisted personnel and war work-

The assistance of the staff is sought and used continuously in technical capacities by a score of Federal agencies—by the War and Navy Departments in establishing harmonious relations between the special service officers and Navy Recreation officers on posts and in communities adjoining camps and bases, in assessing needs and expediting the procurement of recreation facilities and services; by the War Production Board in determining the validity of thousands of commercial and noncom-mercial applications for priorities in the recreation field, and in determining civilian requirements for amusement and recreation equipment and materials; by the Office of Price Administration in determining the validity of requests for additional food requirements by recreation institutional users in military and war industrial communities; by the War Manpower Commission and the Congested Production Area Committee in appraising recreation needs and resources as they relate to manpower utilization and increased production schedules; by the Office of Defense Transportation in determining the validity of travel requests in connection with camps and other recreation activities; by the Federal Public Housing Authority in securing leadership and in supervision of recreation areas in housing projects.

The Social Protection Division was established to implement the Federal Government's policy, adopted as a part of the defense program, for the repression of prostitution as a means of venereal

disease control. Responsibility for such measures is in the hands of local law enforcement officials and the work of the Social Protection Division has been directed toward increasing the effectiveness of their efforts by: stimulating local law enforcement activities for the repression of prostitution; obtaining public support for repression; coordinating the work of law enforcement agencies with that of health, welfare, and military agencies; assisting in the organization of community programs for the prevention of prostitution and sexual promiscuity; working with the Public Health Service in the establishment of rapid treatment centers for the treatment of venereal disease and in setting up social and redirective services in these centers; and enlisting the cooperation of both local and national organizations of the hotel, taxicab, tourist court, and liquor industries to prevent their use to facilitate prostitution activities.

The Division operates through 40 representatives in the field and a small administrative staff in Washington. This staff works in close cooperation with the Army, the Navy, the Public Health Service, and the American Social Hygiene Association.

Both at the national level and in the individual military establishments, it works with the armed forces for the purpose of protecting the military services from venereal disease existing among our civilian population. The Army and Navy Venereal Disease Control Officers provide representatives of this Division with information in regard to the communities and areas which are alleged to be places of pick-up and exposure by infected service personnel. More detailed information is supplied by the Army and Navy Venereal Disease Control Officers to the local health departments and the local police departments, which is used to locate civilians to whom infections have been attributed. The relationships between the police and health departments and individual military establishments have been largely developed by representatives of the Social Protection Division.

Two committees have been established to advise the Social Protection Division: the Federal Security Administrator's National Advisory Police Committee on Social Protection and the National Women's Advisory Committee on Social Protection.

en's Advisory Committee on Social Protection.

During the 1942 and 1943 fiscal years considerable progress was made toward the repression of prostitution, and the closing of red light districts as measures of venereal disease control. Red light districts have been closed down in more than 350 communities in the United States. Army and Navy venereal disease rates have reached their lowest point in history, an accomplishment in which this Division has played a large part.

About 200 Social Protection Committees have either been established in cities and communities, or are now in stages of formation. These committees include representatives of local law enforcement, health, welfare, and civic organizations, officials concerned with the control of venereal disease, and citizens of the community. These committees are working to stimulate and to help develop local community venereal disease control programs.

The Division has obtained the cooperation and support of the International Association of Chiefs of Police, the National Sheriff's Association, the American Bar Association, and several national organizations representing private industry, and it has obtained the support, through its National Women's Advisory Committee on Social Protection, of the club women of the nation.

Through the Federal Security Administrator's

National Advisory Police Committee, the Division has aided in the development of specific enforcement techniques for use in the repression of prostitution. These techniques have been issued in printed form under the title Techniques for the Repression of Prostitution. (See also JUVENILE DE-

LINQUENCY.)

On Aug. 12, 1942, the Chairman of the War Manpower Commission issued a directive requesting this Office to develop, integrate, and coordinate Federal programs for the care of children of working mothers. To carry out this responsibility, the Day Care Division was set up. For a period of 10 months the Division gave direction to the program, integrated the activities of cooperating agencies, and allocated a fund of \$400,000 made available from the President's Emergency Fund.

The Day Care Division administered this \$400,-000 allocation in collaboration with the Children's Bureau and the Office of Education. Field services were provided through these agencies. The Office of Education assigned to regional offices specialists on extended school services to assist State departments of education in developing their services. Similarly, field consultants of the Children's Bureau were assigned to work on the welfare aspects of the program. Regional Directors of the Office of Community War Services were made responsible for facilitating clearance and joint planning be-tween these and other Federal agencies, including the U.S. Employment Service; the Recreation Division, Office of Community War Services; the Bureau of Public Assistance, Social Security Board; the National Housing Agency; the Farm Security Administration, Department of Agriculture; the Federal Works Agency; and the Office of Civilian Defense. Funds were made available to State departments of welfare and education for the employment of personnel to study, develop, coordinate, supervise, and administer the program of services to children of working mothers in the States and localities having need of these services. The administrative and supervisory functions of the welfare and school authorities were integrated through the media of State and local committees made up of representatives of the administrative agencies, other related agencies, labor, industry, and civic groups.

Thirty-five State departments of education and 28 State departments of welfare received Federal funds to employ personnel to plan and develop necessary services. These grants covered 40 States, the District of Columbia, and Hawaii, and in 27 States the State departments of both welfare and education received Federal funds. The approved grants to States provided for the services of 222 workers. About one-fourth of these workers were assigned to State offices and about three-fourths to

particular critical labor shortage areas.

The marked progress in the provision of adequate services throughout the country for children of working mothers during the first six months of 1943 was due primarily to the personnel supplied to the State departments and assigned to particular localities through use of the \$400,000 from the Emergency Fund of the President; this was terminated June 30, 1943. Recommendations relative to changes in the administration of the program were formulated in collaboration with the appro-priate agencies and submitted to the War Manpower Commission, the Bureau of the Budget, and

Committee on Physical Fitness. The general objective of this Committee is to promote among individuals of all ages an interest in the improvement

of their health and physical condition as a contribution to the war effort. The Wartime Council on Physical Fitness, appointed by the Federal Security Administrator, serves it in an advisory capacity. The Committee's aim is to promote the establishment of effective State and community organization and the fullest assumption of responsibility for physical fitness in schools and colleges, and in the various private national organizations interested in this field.

Its subcommittee on State and local organization is responsible for development of the physical fitness program through State and local government channels. The subcommittee on schools and colleges has the responsibility of promoting the development of physical fitness programs in educational institutions; it cooperates in these activities with the Office of Education. That on institutional planning has similar responsibilities relating to special-interest groups including labor and veterans' organizations, Parent-Teacher Associations, service clubs, and farm and industry groups. As of June, 1943, State directors of physical fitness had been appointed by the Governors and programs were under way in 38 States.

In addition to the special wartime measures adopted by the Federal Security Agency, each of its constituent units has been called upon to expand and adapt its programs to meet the needs of

the times.

FEDERAL TRADE COMMISSION (FTC). An independent agency of the U.S. Government, established in 1914, which has the following threefold purpose: To promote free and fair competition in interstate trade in the interest of the public through prevention of price-fixing agreements, boycotts, combinations in restraint of trade, unlawful price discriminations, and other unfair methods of competition and unfair and deceptive acts and practices; to safeguard life and health of the consuming public by preventing the dissemination of false and fraudulent advertisements of food, drugs, cosmetics, and devices which may be injurious to health; and to make available to the President, the Congress, and the public factual data concerning economic and business conditions as a basis for remedial legislation where needed, and for the guidance and protection of the public interest. Since the out-break of war the staff has been concerned largely with special war work. Chairman in 1943: Garland S. Ferguson.

FEDERAL WORKS AGENCY (FWA). An agency of the U.S. Government which comprises those agencies dealing with public works and the administering of Federal loans and grants for construction. The component agencies are:

> Public Buildings Administration Public Roads Administration
> Public Works Administration (in liquidation)
> Work Projects Administration (in liquidation) Federal Fire Council Federal Real Estate Board

War public works are under the direction of the Federal Works Administrator, who may construct projects directly or use any constituent units of the Agency or other proper Federal or non-Federal or-ganizations to expedite this phase of the War Program, under authorizations by the President. As of

Aug. 31, 1943, a total of 4,180 War Public Works and Services projects had been approved by the President, to cost an estimated total of \$450,398,373.

Included in the Services projects are nursery schools and child care centers. Administrator in 1943; Maj. Gen. Philip B. Fleming. See Puerto Rico under *History*.

### FEDERATED MALAY STATES. See BRITISH MALAYA.

FENCING. Members of the Fencers Club of New York dominated their sport last season in a year that found the men's national team championships abandoned because of the war. Dr. Norman Armitage continued as king of the saber men, winning top honors with that weapon for the fifth successive time. Robert Driscoll took the épée crown after ten years of trying and Miss Helena Mroczkowska gave the club its third major U.S. title when she regained the women's championship she had won in 1940. Warren Dow of the New York A.C. was best with the foil and the Salle Santelli four of the Misses Madeline Dalton, Grace Acel, Maria Cerra, and Aida Condosta won the U.S. women's team title.

Navy ended the reign of New York University as three-weapon ruler in the Intercollegiate Association, taking the épée and saber team crowns away from the Violet at the same time. Midshipman Russell Blalack added to the Annapolis victories by taking individual épée honors. N.Y.U., however, captured the coveted Little Iron Man Trophy by winning the team foil championship, Robert Kaplan of the Violet annexing the individual prize to become the first freshman to carry off a title in the intercollegiate tourney. Army's Coleman Richards was best with the saber

was best with the saber.

New Jersey State Teachers kept the women's intercollegiate championship. Miss Grace Acel, then in her last year at Cornell University, won the individual title for the third time.

FIJI. A British colony in the southern Pacific, consisting of some 250 islands (80 inhabited) and the dependent islands of Rotuma. Total area, 7,083 square miles. Total population (Jan. 1, 1942), 227,280 (107,104 Fijians, 101,841 East Indians, 4,494 Europeans, 2,236 Chinese, 5,229 of European and native descent, 3,175 Rotumans, and 3,201 others). Suva (capital), including suburbs, had 15,522 inhabitants (1936). Education (1941): 419 schools and 32,511 students enrolled.

Production and Trade. The principal products are sugar, copra, bananas, pineapples, copal, native foodstuffs, and gold. There are 3,697 square miles of forests, from which are produced both hardwoods and softwoods. Livestock (1939–40): 84,000 cattle, 27,000 goats, 16,800 horses, donkeys, and mules, and 8,500 pigs. Trade, (1942): imports £2,216,716 (foodstuffs and manufactured goods were the main items); exports £2,142,442 (sugar

131,294 tons valued at £1,761,055, copra 16,861 tons £252,544, bananas £42,400, canned pineapples £17,040).

Communications. During November, 1941, Suva became a port of call in Pan American Airways' regular transpacific service between the United States and New Zealand. Roads (1940): 2,331 miles. There are several wireless telegraph stations on the islands.

Government. Finance (1941): revenue £1,124,-210; expenditure £1,069,046. Public debt (Dec. S1, 1941), £1,574,692. A governor, assisted by an Executive Council, administers the colony. There is a Legislative Council consisting of the Governor as president, 16 official members, 5 European members (3 elected, 2 nominated), 5 Fijian members (nominated by the Governor from a list submitted by the Grand Council of Chiefs), 5 East Indian members (3 elected, 2 nominated). The chiefs control the native administration under the Governor's supervision. Governor of Fiji and High Commissioner for the Western Pacific, Maj. Gen. Sir Philip Mitchell (appointed June 16, 1942).

History. It was reported in Suva, Fiji, May 14, 1943, that the first group of Fijian regular troops to serve overseas had arrived at an advanced station in the Pacific area.

FILMS. See MOTION PICTURES; PHOTOGRAPHY; topics listed under Training Films. For Film Bulletins, Film Strips, see PHOTOGRAPHY.

FINANCE. See BANKS AND BANKING; BUSINESS RE-VIEW; FINANCIAL REVIEW; PUBLIC FINANCE; TAX-ATION; foreign countries under *Finance*; UNITED STATES under *Congress*.

FINANCIAL REVIEW. The financial markets were called upon to absorb the largest volume of financing ever consummated in one year during 1943. The Treasury carried on two war loan drives in April and September, and offered securities at other times for cash or in exchange for maturing obligations. During the year, over \$36,600,000,000 of bonds, notes, and certificates of indebtedness were sold for cash, and almost \$10,000,000,000 more were issued in exchange for maturing obligations. In addition, the Treasury raised some \$12,000,000,000 through net sales of war savings bonds, and increased the amount of Treasury bills outstanding by over \$6,400,000,000 during the year.

400,000,000 during the year.

This huge volume of Treasury financing further curtailed corporate security flotations. These declined to the lowest level in a long period of years, reflecting the fact that the Government was providing both fixed and working capital for industries engaged in the war effort, so that private financing was seldom called for. This was markedly different from the experience during the first World War, when industry was expected to provide a much larger part of the capital needed to finance war production, and a Capital Issues Committee was set up in order to determine which new issues should be permitted as necessary for the war effort. (See Public Finance.)

The Stock Market. Stock prices enjoyed a broad advance during 1943, continuing the major rise which began in April, 1942. Several factors contributed to the upturn in stock prices. First, opposition in Congress to material increases in corporate taxation provided assurance that large wartime earnings would not be cut down further by raising corporate income and excess profits tax rates. (See Taxation.) Secondly, the favorable course of the war indicated that fears of a long

drawn out conflict, which accompanied the sharp decline of the market in the spring of 1942, were not justified. In the third place, the revolt in Congress against social reforms and various New Deal policies promised that economic measures more favorable to business could be expected, both during the war period and more especially in the postwar era. The advance in the market continued with but minor interruptions until July, when the fall of Mussolini brought a reaction because it was felt that the end of the war might be very near. While it was generally recognized that, following a period of transition, a high level of business activity was probable because of widespread shortages of consumer durable goods, it was evident that the transition would require a number of months during which industrial activity would be at low ebb, unemployment would be widespread, and corporate earnings would fall to a low level. As it became evident that Cermany would continue the war without her Axis partner, the market firmed. Selling to establish losses or gains for tax purposes had a depressing effect during November and early December.

The highs and lows of the New York Times stock price averages are shown as follows:

TABLE 1—STOCK MARKET AVERAGES, 1943 (50 Stocks—25 Rails and 25 Industrials)

| Month     | High   | Low   | Last   |
|-----------|--------|-------|--------|
| January   | 87.08  | 82.31 | 86.99  |
| February  | 90.58  | 86.24 | 90.28  |
| March     |        | 88.46 | 93.54  |
| April     | 95.12  | 89.62 | 94.01  |
| May       |        | 93.90 | 99.07  |
| June      |        | 95.82 | 100.13 |
| July      | 102.01 | 93.51 | 93.79  |
| August    | 95.81  | 92.40 | 93.90  |

| October   |        | 93.87 | 95.30  |
| November  | 95.72  | 88.70 | 89.04  |
| December  | 93.20  | 89.02 | 92.10  |

Railroad stocks enjoyed substantial advances during the year as the carriers reported earnings only slightly below 1942 levels. (See Railways.) Public utility securities participated prominently in the year's rising stock markets. The attitude of the Securities and Exchange Commission was somewhat modified toward the administration of the "death sentence" provisions of the Public Utility Holding Company Act of 1935. The SEC displayed less insistence upon interpreting the law in a manner least favorable to the holding companies, and approved plans which enabled such leading holding company systems as United Gas Improvement, National Power & Light and Cities Service Power & Light to make substantial progress toward liquidation. Very sharp advances occurred in a number of holding company securities as the market discounted the elimination of some of the uncertainties surrounding these issues, as well as increased break-up values. (See Electric Light AND POWER.)

Industrial stocks benefited from the higher level of corporate earnings, but investors showed a tendency to shift from issues heavily dependent upon war business to those that would participate in the expected postwar expansion of consumer durable goods industries. This was especially so during the last half of the year, when trading was influenced to a large extent by the belief that the end of the war was approaching and that war contractors faced the risk of large-scale termination of contracts. The high, low, and closing prices of leading issues listed on the New York Stock Exchange during 1943 are shown in Table 2 in the next column.

The turnover on the New York Stock Exchange during 1943 aggregated 278,741,765 shares, the largest for any year since 1938. March was the

heaviest trading month with a turnover of 36,997,-243 shares, while October was the month of the smallest total, with 13,922,678 shares. The volume of trading compared with 125,677,963 shares for 1942. Dividend payments were reported by the Department of Commerce as shown in the following Table 3.

TABLE 3—DIVIDEND PAYMENTS (In millions of dollars)

| Total                                      | 3,529             | 3,541             |

Dividend payments increased but slightly during the year, and were smaller for some corporate groups, because of the prevailing desire to retain earnings for reserves against contingencies. Total dividend distributions amounted to less than 50 per cent of net income for the year, not count-

ing such reserves.

Blocks of listed stocks were distributed in many cases through "special offerings" on the floor of the New York Stock Exchange. In a total of 61 such offerings, almost a million shares were sold. Two factors, however, tended to check the further expansion of this practice. First, the increased turnover on the stock exchange encouraged sales in the regular way, since there was less fear of a break in price due to the thinness of the market. Secondly, an announcement late in the year that the Rockefeller family planned to dispose of 1,-000,000 shares of various Standard Oil stocks to raise funds for the purchase of Government bonds depressed the market for these issues for a time, since it was feared that the floating supply would be increased and their market position impaired. Plans for this largest of all secondary distributions were abandoned, and it is probable that several other large operations of the kind were given up as it was recognized that, when attempted on too large a scale, secondary offerings off the market and special offerings on the exchange could lead to market weakness.

The Bond Market. Because the Treasury carefully adjusted its new offerings to what institutional, corporate, and individual investors could absorb, and because the rank and file of individual investors were being sold nonmarketable obligations, liquidation of which did not depress market quotations, prices of Government bonds remained firm throughout the year, despite the record volume of new financing. The average yield of all U.S. Treasury taxable bonds with maturity or call dates 12 years or more away for December was 2.34 per cent, as compared with 2.36 per cent in December, 1942. For outstanding partially tax-exempt issues, the yield in December, 1943, averaged 1.86 per cent, as compared with 2.09 per cent for December, 1942.

High-grade corporate bonds were generally strong during the year. The very small volume of new issues, and the desire of institutional investors to acquire some corporate obligations for their portfolios along with the huge amounts of Treasury bonds bought during the war loan drives, caused the best grade of corporate obligations to rise to the highest price level on record. The yield on Aaa bonds for December was computed by Moody's at 2.74 per cent, as compared with

2.81 per cent for December, 1942. Yields on other ratings of bonds compared as shown in the following tabulation:

| Rating | 1942 | 1943 |
|--------|------|------|
| Aa     | 2.96 | 2.86 |
| A      | 3.23 | 3.13 |
| Baa    | 4.28 | 3.82 |

The course of corporate bond yields from month to month during the year, as reflected in the averages computed by Moody's Investors Service, is shown below:

The market for municipal bonds was consistently strong during the year. The outstanding supply was reduced as new financing fell to a very low level, while many States and municipalities paid off debt because of increased wartime tax collections and restrictions on public works programs of all kinds. High personal income taxes made the tax exemption enjoyed by municipal obligations particularly valuable, while the refusal of Congress to consider modification or withdrawal of their tax-exempt status made wealthy investors readier to bid up prices of these bonds.

Trading was very active in the railroad bond section, especially in reorganization obligations. Record earnings, progress on reorganization plans following the issuance of the Supreme Court's decisions in the St. Paul and Western Pacific cases in March, and large back interest payments on a number of defaulted bonds stimulated the rise. Bonds of a number of "borderline" railroads also rose sharply, both on improved earnings which made the threat of default less imminent and on large-scale repurchases by many of the issuers.

The turnover of bonds on the New York Stock Exchange during 1943 aggregated \$3,254,716,525, which compared with \$2,311,479,250 in 1942. The total turnover of U.S. Government securities on the New York Stock Exchange amounted to only \$4,-192,025, as compared with \$6,533,850 in 1942. As in prior years, the great bulk of the trading in Government bonds was effected over-the-counter

by Government bond dealers.

New Financing. Corporate financing declined to the lowest level in a long period of years. This resulted chiefly from the fact that most of the new plants required for war production were financed by the Defense Plant Corporation, a subsidiary of the Reconstruction Finance Corporation. The DPC and the armed services accounted for more than \$15,000,000,000 of new plant construction for war purposes, whereas all plant investment by industry since the defense program was launched in June, 1940, approximated \$6,000,000,000. New offerings of securities for the account of issuers other than the Federal Government from month to month during the year 1943 are recorded in Table 5 at the top of page 203.

New financing other than that of the Federal Government in 1943 compared with earlier years as shown in Table 6.

as shown in Table 6.

The U.S. Treasury borrowed a total of \$57,637,000,000 during 1943, increasing its total debt to \$170,108,000,000. It obtained \$12,313,000,000 of this sum through net sales of nonmarketable war

The extent to which individual savings have increased as a result of wartime economic conditions may be seen from the following table:

Financial Regulation. Because of preoccupation with the war effort, the Securities and Exchange Commission was relatively inactive during the year. The

savings bonds, and \$18,948,000,000 through sales of marketable bonds. Another \$12,309,000,000 was raised through sales of certificates of indebt-edness maturing within one year, which proved attractive both to banks and corporations, and \$6,445,000,000 was obtained through the sale of Treasury bills to banks. The Treasury raised \$1,312,000,000 by sales of notes, and \$2,202,000,000 from tax anticipation notes. A total of \$3,671,000,000 was obtained from the sale of special issues, chiefly to the Social Security funds.

The Nation's Savings. Money savings by individuals, consisting of the excess of individual incomes over expenditures on consumer goods and services and personal income taxes, registered only a small increase over 1942. While national income payments increased considerably (see Business Review), this was offset by higher taxes and larger outlays for consumer goods and services. Estimates of the SEC of liquid savings for the first three quarters of 1943, and for preceding years, were as follows:

agency refrained from advancing additional reform proposals, and concentrated largely upon hastening integration and simplification proceedings against public utility holding companies. Hearings were begun late in the year before the Commission on an extended inquiry into price restrictions contained in security syndicate agreements among dealers offering new issues of securities. These had not been completed by the end of the year. See Law under Supervision of Federal Agencies.

International Finance. Because of the operation of Lend-Lease (q.v.) which enabled countries associated with the United States in the war effort to obtain huge quantities of war materials and supplies they required without cash payment, there was little need for international lending. The Treasury reported a net inflow of \$936,000,000 in its report on international capital movements, of which \$810,000,000 consisted of short-term banking funds. Wartime transactions with Latin America and neutral European countries provided them with a surplus of dollars, part of which was con-

verted into gold and part kept on deposit in this country. Repatriation of their dollar bonds by some foreign countries resulted in a net reduction of \$81,000,000 in foreign securities outstanding in this country during the first nine months of 1943, and foreigners purchased \$34,000,000 of domestic

securities on balance during the period.

The U.S. Treasury inaugurated a census of holdings of foreign assets by Americans, to supplement the census of foreign holdings of American assets obtained by Form TFR 300. This new census required all residents of this country to report their holdings of securities and other property abroad on Form TFR 500. The Treasury was not explicit as to its purpose in ordering this census, which evoked a number of protests on the ground that elaborate reports were required even from holders of very small blocks of foreign obligations.

Active discussion of plans for currency stabiliza-tion and international lending after the war centered attention upon the problem of blocked balances held by the British Empire and Latin American countries in London, which resulted from Britain's very unfavorable balance of trade under wartime conditions. By the end of the year, it was estimated that India had accumulated upwards of £600,000,000 in London, and that total foreign balances amounted to well over £1,-000,000,000 and were increasing at the rate of £300,000,000 a year. It was recognized that the existence of these frozen balances would seriously hamper the possibility of stabilizing sterling after the war, unless special measures were taken to handle them. The White Plan for international currency stabilization provided for the gradual unfreezing of these balances by the proposed International Stabilization Fund. American bankers suggested as an alternative a large postwar credit to London to assure stabilization of the pound-dollar rate. The U.S. Treasury also proposed the establishment of a United Nations Bank for Reconstruction and Development, with an authorized capital of \$10,000,000,000, to carry on postwar lending which could not be effected through ordinary private channels, to assure extensive international lending in the postwar period. See Postwar Plan-NING.

FINLAND. A republic of Northern Europe. Capital, Helsinki.

Area and Population. Finland had an area of 134,253 square miles following the cession of 13,558 square miles of territory to Russia by the Soviet-Finnish peace treaty of Mar. 12, 1940. The entire ceded territory was reoccupied by Finnish and German troops in 1941 after Finland joined Germany in its war with Russia, and on Nov. 29, 1941, the Finnish parliament voted to annul the peace treaty and reincorporate the ceded regions in the national territory. Estimated population of the prewar area on Jan. 1, 1943, was 3,887,217 (3,667,067 at the 1930 census). Living births in 1941 averaged 24.2 per 1,000 in 1940 (14.8 in 1939). About 90 per cent of the inhabitants speak Finnish and most of the remainder Swedish. Estimated populations of the chief cities on Jan. 1, 1940, were: Helsinki (Helsingfors),

304,965; Tampere (Tammerfors), 76,730; Turku (Abo), 74,351; Viipuri (Viborg), 74,247; Vaasa (Vasa), 32,695; Oulu (Uleaborg), 28,021; Lahti, 26,864; Kuopio, 24,836. Swedish place names are

given above in parentheses.

Education and Religion. School attendance in 1938–39 was: Elementary, 403,403; secondary, 50,580; university and schools for higher education, 8,752; vocational and technical, 20,583. Less than 1 per cent of the adult population was illiterate in 1930. War damage to educational institutions in 1939–40 was estimated at 333,000,000 marks. The Technical University of Helsinki, where damage totaled 20,000,000 marks, was repaired and reopened by Oct. 1, 1940. The population on Jan. 1, 1938, included 3,680,237 Lutherans, 70,887 Greek Catholics, 9,840 Baptists and other Evangelical church members, 1,551 Roman Catholics, 1,755 Lews, and 360 Moslems

Catholics, 1,755 Jews, and 360 Moslems.

Production. In 1930 60 per cent of the working population was engaged in agriculture and 16.8 per cent in industry, but Finland produced only about four-fifths of its agricultural requirements in the period before 1939. The two wars with Russia in 1939-40 and 1941-44 placed a great strain upon the Finnish economic system. The 1942 grain harvest of 425,000 metric tons was about 70 per cent of normal. The yield of sugar beets was 132,000,000 lb., or 50 per cent more than in 1941; of potatoes, 2,136,200,000 lb. (1,744,600,000 in 1941). The livestock census of March, 1942, showed 273,838 horses, 1,487,663 cattle, 352,016 sheep, 236,566 swine. The output of sawn timber in 1942 was 500,000 standards (of 1,980 bd. ft.), compared with 450,000 standards in 1941 and a normal production of about 1,200,000 standards. The 1941 production of plywood was 1,059,399 cubic ft.; chemical wood pulp, 590,000 tons; mechanical wood pulp, 20,000 tons; newsprint, about 50,000 tons; other paper, about 190,000 tons. Manufacturing is confined mainly to the processing of

agricultural and forest products.

Foreign Trade. Merchandise imports in 1942, including bullion but excluding war materials, totaled 11,736,000,000 Finnish marks (10,200,000,000 in 1941); exports, 5,988,000,000 (4,320,000,000). For the composition and distribution of the 1941

trade, see 1943 YEAR BOOK.

Finance. Ordinary budget estimates for 1943 balanced at 18.3 billion marks, as against prewar budgets of around 5 billions. War expenditures for 1940–42 were reported to total 44 billion marks and were estimated at 19 billions for 1943. Actual tax revenues rose from 3.8 billions in 1940 to 13 billions in 1942. Actual expenditures in 1942 were about 27 billion marks (19 billions for war).

The public debt on Dec. 31, 1942, totaled 40 billion marks, an increase of 9.5 billions during 1942; total loans from the Bank of Finland, 14.6 billions; clearing balance owed by Finland, 3 billions; notes in circulation, 9.6 billions (2 billions on Dec. 31, 1937). The average exchange rate of the mark, problematical because of rapid inflation in 1942–43, was \$0.0187 in 1940 and \$0.0201 for

January-June, 1941.

Transportation. The railways, mostly state-owned, extended 5,107 miles in 1939. The highway network covered 39,826 miles in 1940. Air lines connected Helsinki with Stockholm and the German European air network. Ships entering Finnish ports numbered 6,985 in 1939, 2,589 in 1940, and 2,320 in 1941. As of Dec. 31, 1941, Finland had a merchant fleet of 494 vessels aggregating 543,000 gross tons; this represented a loss of 42 per cent of the prewar merchant marine due to the war.

Government. The Constitution of July 17, 1919, vested executive power in a President elected for six years by 300 electors, chosen in the same man-ner as members of the Diet. Legislative power rests with the unicameral Diet and the President. The 200 members of the Diet are elected by direct vote of all citizens, male and female, 24 years or more of age. The cabinet is appointed by the President but is responsible to the Diet. President, Risto Ryti (National Progressive), who became Acting President on Nov. 28, 1940, and was elected Dec. 19, 1940, for the term ending Mar. 1, 1943. The standing of the parties in the Diet elected July, 1939, was: Social Democrats, 85; Agrarians, 56; National Coalition, 25; Swedish People's party, 18; Patriotic National Movement (pro-Fascist), 8; National Progressives, 6; Small Farmers, 2. The parliamentary elections scheduled for 1942 were postponed to 1944. A government of pational union representing a coalition of the six national union, representing a coalition of the six principal parties, was formed Dec. 1, 1939, upon the outbreak of the Russo-Finnish war. It continued in office through 1943. Premier at the beginning of 1943, Johan Wilhelm Rangell, who assumed office Jan. 4, 1941.

Finland entered into a state of war with the Union of Soviet Socialist Republics on June 26, 1941, without a formal declaration. It adhered to the Anti-Comintern Pact for five years on Nov. 25, 1941, but did not sign the Three Power Pact—the Axis military alliance. The British, Canadian, and New Zealand Governments declared a state of war with Finland as from Dec. 7, 1941; Australia and the Union of South Africa, as from December 8; the Government of Czechoslovakia, as from Dec. 16, 1941. For developments in 1943,

see History below.

### HISTORY

Finland's Dilemma. The dilemma in which Finland found itself in 1942 as a result of the failure of the German attack upon Russia (see 1943 YEAR BOOK, p. 244) became progressively worse during 1943. Popular pressure upon the Finnish Government for withdrawal from the war increased in direct ratio to the steadily declining military for-

tunes of Germany.

The grim prospect of impending defeat reversed the dictatorial, pro-Nazi trend noted in some governmental and conservative circles in 1942. There was a relaxation of the censorship and police restrictions that had prevented free discussion of Finland's future course. In response to the growing public demand, the Government made repeated efforts to withdraw from the war. But it was balked by German threats of retaliation and by the Soviet Government's uncompromising attitude, considered equivalent to a demand for unconditional surrender. Except for the Finnish Communists in exile in Russia, all parties and classes supported the Government in its refusal to consider the latter alternative.

Throughout 1943, Finnish internal politics and foreign policies revolved about the incessant search for a way out of the dilemma. Six to nine German divisions were stationed in Northern Finland. The country was dependent upon German-controlled Europe for 90 per cent of its trade and for 40 per cent of its breadstuffs. The Finns could not withdraw from the war without provoking German military occupation, a food blockade, or both. Nor could they entrust their fate to the mercy of the Soviet Government without imperiling their national independence, their democratic political institutions, and their free economic sys-

tem (consult YEAR BOOKS for 1939 and 1940). As insurance against the danger from both Germany and Russia, the Finns late in January were reported to have opened negotiations for an alliance with Sweden. At the same time the Finnish Government sought to improve its strained relations with the United States and to secure American assistance in negotiating a peace with Russia that would safeguard Finnish independence and territorial integrity. In these largely secret negotiations, the Finnish Government was reported willing to give up the territories in Russian Karelia won with German aid in 1941. But it held out strongly for restoration of the 1939 boundaries, which were altered in Russia's favor by the bloody winter war of 1939-40.

These negotiations dragged on fruitlessly throughout 1943. Meanwhile Finland perforce continued its policy of passive military, political, and moral cooperation with the Axis. Finnish troops were reportedly withdrawn from occupied Soviet territory south of Lake Ladoga early in the year. But elsewhere they remained on the defensive in

Russian territory.

Presidential Election. The determination of prodemocratic forces in Finland to prevent a diplo-matic rupture with the United States played a leading part in internal political developments. Early in the year the powerful Social Democratic party and elements in the Swedish People's party launched a vigorous attack upon Minister of Foreign Affairs R. J. Witting, whose pro-German policies were held responsible for the severance of American-Finnish consular relations late in 1942. President Ryti was notified that he could not expect reelection if he retained Witting in the Cabinet. At the closing session of the Diet on January 26, President Ryti devoted one-third of his speech to a discussion of Finnish-American relations. He expressed hope that the traditionally friendly understanding would be restored.

When the 1943 session of the Diet convened on February 2, the successful Russian winter offensive against the Germans was in full swing. Addressing the session, Ryti for the first time made an open bid for the assistance of the western democracies in saving Finland from the consequences of a Ger-

man defeat.

This policy apparently regained for the President the wavering support of the Social Democrats and Swedish People's party. After Field Marshal Baron Karl Gustav Mannerheim, commander in chief of the Finnish armies, had refused to accept the nomination offered by the strong Agrarian party, Ryti was reelected for a two-year term beginning March 1 in an election held February 15. Since no popular elections had been held since the outbreak of war, the decision rested with the 300 Presidential electors chosen in 1937. Ryti received 269 votes on the first ballot; 24 votes were blank, and 7 were cast for noncandidates.

There had been little preelection campaigning, as the Government discouraged political discussion. However the Council of the Social Democratic party, on the eve of the election, issued an important manifesto urging the removal of hin-drances to friendlier relations with the United States. The statement also declared that Finland's war with Russia was separate from the war as a whole and that the republic reserved the right to withdraw from hostilities "when the right moment strikes and her liberty and independence are se-

New Cabinet Formed. In accordance with tradition, Premier Rangell and his entire Cabinet resigned on February 16 to permit President Ryti to reorganize the Government. The Finnish Ministers to Germany and the Vatican were called home for consultation in connection with this reorganization. The day after his inauguration on March 1 for a second term, President Ryti called on Vaino Hakkila, speaker of the Diet and leader of the right wing of the Social Democrats, to form a new Cabinet. Known for his pro-American and democratic sympathies, Hakkila selected Sir Henrik Ramsay, a man of similar views, for the key post of Foreign Minister. However he was unable to win the support of the Agrarians, second largest party in the Diet. (In a manifesto issued February 28, the Agrarians had demanded effective prosecution of the war "to a finish" and a foreign policy designed "to secure fully our national independence and future defensive possibilities." They also mestic economic issues.)

President Ryti then selected Prof. Edwin Linkomies, vice chairman of the conservative National Coalition party, as a compromise Premier on whom both the Social Democrats and Agrarians could agree. On March 5 Linkomies formed a new coalition government including representatives of all of the political parties except the profascist Lappo, which dissapproved of the "tendency" of the other Linkomies appointees. Sir Henrik Ramsay replaced Witting as Foreign Minister, but nine other members of the Rangell Cabinet were retained, including Finance Minister Vaino Tanner, leader of the Social Democrats, and the Minister of Social Affairs, Karl August Fagerholm, who had proffered his resignation the previous December to balk a German demand for Gestapo control of foreign Jews and other anti-Nazi political exiles in Finland. Gen. Karl Rudolf Walden, Mannerheim's right-hand man, retained

the Defense portfolio.

Peace Initiatives. The composition of the Cabinet and the circumstances under which it was formed indicated a desire to proceed more actively with peace negotiations. The Germans and their Finnish supporters countered this by increasing pressure for more active Finnish military assistance. In April the U.S. State Department informally and confidentially offered to use its good offices in promoting peace between Finland and Russia. Foreign Minister Ramsay was then sent to Berlin by the Linkomies Government in an apparent effort to win German consent to such negotiations. The German Foreign Minister, however, reportedly threatened to make a separate peace with Russia at Finland's expense if the Finns allowed themselves to be seduced by Washington.

The Finnish Government accordingly sent an evasive reply to the State Department. Provoked by these events, the U.S. Government late in April reduced its legation staff at Helsinki to a single official. Severance of Finnish-American diplomatic relations seemed imminent. In mid-May Premier Linkomies announced that prospects for peace with Russia were uncertain, but that Finland would never permit a foreign power to destroy its national existence and independence.

The continued German retirement in Russia, the collapse of Italy, and the barring of further German troop movements across Sweden was followed early in August by new Finnish initiatives for a separate peace with Russia. These moves were believed to be inspired by growing public pressure. On August 20 a manifesto signed by 50 leading Finns from the major political parties urged President Ryti to facilitate an examination of pos-

sibilities for peace by naming ex-Premier J. K. Paasikivi to the Premiership in place of Professor Linkomies. On September 3 the Diet had a full-dress debate on foreign policy for the first time in almost two years, at which Premier Linkomies reportedly satisfied his critics.

In an interview with Finnish and foreign correspondents on September 12, Linkomies openly declared that Finland desired peace with Russia on the basis of her pre-1939 independence and territorial status, but would never accept unconditional surrender. He said that Finland regretted being at war with Britain, wanted more intimate relations with the United States, and was enthusiastically in favor of a "Nordic union," or an alli-

ance of the Scandinavian states.

This peace talk gradually died down, without reaching the stage of direct negotiations, in the face of Moscow's persistent refusal to state its terms. There was strong sentiment in Finland for the evacuation of Finnish-occupied districts of Soviet Karelia preliminary to a direct approach to Russia. However the Finnish General Staff rejected this proposal, holding that the Finnish positions in Russia offered the only guarantee against future Soviet aggression. Meanwhile an undeclared armistice was reported in effect along the whole Finnish sector of the Russian front.

Anti-German Trend. As Finland gradually moved toward a more independent foreign policy, there were signs of growing distrust and noncooperation between the Germans and Finns. A battalion of Finns who volunteered in 1941 for service with the Germans against Russia returned to Finland in June upon the expiration of their contract. The Finnish Government disbanded the unit on July 11, refusing to permit any of its personnel to rejoin the Germans. Upon the resignation of Mussolini in Italy, Finland refused to recognize Mussolini's "Fascist republican" regime despite German protests. Sections of the Finnish press denounced German persecution of the Jews in Denmark and the subsequent Nazi round-up of Norwegian students. Estonians fleeing their German-controlled country were received with sympathy in Finland. With the relaxation of the censorship, Finnish newspapers featured news of German defeats.

In mid-November there were reports that the Germans were planning a pro-Nazi coup d'état in Finland in conjunction with Finnish Nazis and some general officers in command of the Finnish home front. Minister of Social Affairs Fagerholm resigned December 11 under renewed German pressure and was succeeded by A. Aaltonen, secretary of the Social Democratic party. In mid-December Stockholm reports told of rioting in Helsinki among Finnish troops ordered to return to the front. New peace appeals to Russia were made by the Finnish radio on December 15, but Premier Linkomies announced at the year's end that the end of the war was "completely hidden

Other Developments. Finnish anxiety to keep on good terms with the United States was reflected in the formation in July of a Finnish-American organization for the promotion of closer relations and in the Government's efforts to maintain its exceptional record of payment on obligations due the U.S. Treasury. On May 1 Finland paid interest of \$473,474 on the \$24,000,000 Export-Import Bank loan advanced during the Finnish-Russian war of 1939–40. Interest payments on Finland's war debt was resumed on June 15, and on October 14 the Finnish Minister in Washington signed an agreement under which Finland undertook to pay

in 20 annual installments the \$845,287 payable on the war debt during the period Jan. 1, 1941, to Dec. 31, 1942, but postponed by the joint Congressional resolution of June 12, 1941.

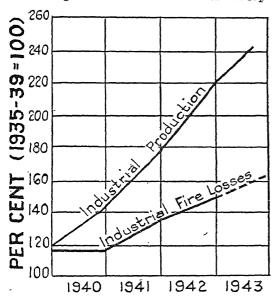

The acute food shortage was relieved to a marked degree during 1943 as a result of the mild winter and larger crops. Conscription of women was resorted to during the spring and summer to obtain sufficient labor for agriculture. Agriculture was also assisted by subsidy payments, an issue which provoked a parliamentary crisis between the Agrarian and Social Democratic deputies in June. Rapid inflation of the currency continued (see Finance). The exhaustion of tax resources led the Cabinet to introduce legislation for another compulsory loan on June 21. A Swedish-Finnish trade agreement, under which Sweden undertook to export goods to the value of 12,500,000 Swedish

to advance a credit of 5,000,000 crowns, was concluded in December. See Chemistry under *Foreign*; Germany and Sweden under *History*; Refuces; Socialism.

crowns to Finland during the first half of 1944 and

FIRE DIRECTOR, Electric. See Physics.
FIRE GUARD UNIT. See CIVILIAN DEFENSE, OFFICE
OF.

FIRE PROTECTION. During the year 1943 losses by fire showed a marked increase. Preliminary estimates by the National Board of Fire Underwriters placed the loss at \$380,235,000, as compared with \$314,295,000 in 1942. This is an increase of approximately 21 per cent over 1942 and is almost 23 per cent greater than the average for the past five years. This increase in losses is largely in the field of industrial fires, which have to a very significant degree caused the destruction of war sup-

plies and productive facilities. A factor of significance in this increase in fire loss was the negative attitude of the War Production Board toward the granting of adequate priorities for fire protection equipment for important industrial and other buildings. As the year ended, a more liberal policy on the part of the WPB tended to improve fire safety conditions by making necessary fire protection equipment more readily available to industrial plants.

Some increase in industrial fire losses is anticipated during periods of accelerated production and higher values and it is probably fair to say that some comfort may be taken from the fact that fire losses are not mounting as rapidly as industrial production. This fact is illustrated by the graph in the preceding column.

During 1943 there were no fires of the magnitude of the S.S. Normandie or Cocoanut Grove night club fires of 1942, or of the Firestone Rubber fire at Fall River, Mass., in 1941. There were however many more fires in the United States and Canada involving losses of a quarter million dollars or more. According to the National Fire Protection Association there were 105 such fires as compared with 80 fires of similar magnitude in 1942, and an average of about 47 in the previous 5 years.

A favorable development of 1943 which will have a long-time benefit was the increase in the number of industrial fire brigades which have been trained and equipped. This development was encouraged by inspectors of the War and Navy Departments, the Office of Civilian Defense, and similar agencies. The first complete manual on the organization and training of industrial fire brigades was published early in the year by the National Fire Protection Association.

Continued decline in the manpower of municipal fire departments brought dire predictions of still more serious fire losses from fire protection authorities. A national survey of paid fire departments in cities over 20,000 population conducted by the National Fire Protection Association revealed that the nation's fire departments have already lost one out of eight of their experienced men to the armed forces. Many of the country's fire chiefs have expressed the fear that further drafting of married firemen of military age may have a disastrous effect on the ability of fire departments to cope with major conflagrations. Inadequate manpower in the municipal fire service was undoubtedly a factor in the increase of large fires during the year. It is likely that during the coming year, municipal fire officials will be faced with the necessity of taking drastic steps to keep the fire departments' strength up to a reasonable minimum. While many local selective service boards were sympathetic to the importance of firemen, many others, faced with continued demands upon the available manpower, did not protect the fire department to an adequate degree.

The average age of fire fighters in many departments has risen to an alarming degree. In a number of cities the age restrictions have been removed and it seems probable that pension costs in many communities may become a serious postwar problem.

The ranks of auxiliary firemen enrolled under the civilian defense program were becoming greatly reduced in many areas because of loss of interest as the danger of enemy air attack diminished. Fire departments generally were faced with heavy additional responsibilities with ever decreasing manpower. See Civilian Defense, Office of.

The demands of the Army and Navy and other Federal agencies for motor fire apparatus continued to absorb the greater part of all fire apparatus production. Late in the year there was evidence that these needs were being met and that apparatus might soon again be available to municipal fire departments at least in limited quantities.

Because of the war, general interest in fire protection and prevention grew rapidly and a greatly increased demand for fire protection standards was

created. The National Fire Protection Association published early in 1943 the National Fire Codes for Extinguishing and Alarm Equipment embracing a compilation of 42 standards in that field and the National Fire Codes for Prevention of Dust Explosions covering 14 standards. In the fall of 1943 the National Fire Codes for Flammable Liquids, Gases, Chemicals, and Explosives was issued embracing 44 standards, and publication of a vol-ume entitled National Fire Codes for Building Construction is planned for 1944, so that some 150 fire standards will be available in four volumes. Other standards issued during 1943 dealt with (1) the installation, maintenance, and use of piping and appliances for city gas and (2) fire protection in plants producing or handling magnesium powder or dust.

In the field of legislation, it is to be noted that the Cocoanut Grove holocaust in Boston, which occurred in 1942, proved to be a stimulus to public interest and concern about fire dangers. Rightly or wrongly, this concern manifested itself largely in a wave of new legislation designed to safeguard places of public assembly against rapidly spreading fires, inadequate exit facilities, and panic. Carried along on this wave of public feeling were a number of excellent fire prevention ordinances and a general effort on the part of fire officials to tighten the enforcement of fire safety laws already on the statute books.

The Model State Fireworks Law was enacted by Massachusetts and New Hampshire, thus bringing to 17 the total of States having enacted this pro-

gressive measure.

In the contest for year-round excellence in fire prevention activity, conducted by the National Fire Waste Council of the United States Chamber of Commerce, Milwaukee, Wis., was awarded top honors for activity during 1942. In the 1943 Fire Prevention Week contest conducted by the National Fire Protection Association, Chicago, Ill., emerged as the winner among more than 1,800 cities participating.

An item of growing importance to many municipalities has been the material increase in the number of airplane crash fires and the difficult problem involved in setting up any procedures to effectively control this type of fire. Just as the year drew to a close, plans were completed for a conference sponsored jointly by the Army Air Forces and the National Fire Protection Association, to be held early

in 1944 to discuss this problem.

As in other fields, those concerned with fire protection are giving thought to postwar plans. Following the war there will be many serious fire protection problems to be solved. Municipal fire departments must be brought back to normal strength once more and standards for fire protection equipment must be promptly restored. The intelligent distribution and use of the thousands of pieces of fire apparatus built for various Federal agencies is a problem of major importance.

Students of building construction and city planning agree that if the United States had been subjected to the type of fire attack that Britain and Germany have been subjected to, much more appalling damage and destruction would have been inevitable. The gradual rebuilding of American cities to make them immune to the dangers of conflagrations and sweeping fires is a long-range problem of the utmost importance to the future welfare of this country. Only by long-range planning and reconstruction of our cities in times of peace can we have any assurance of maintaining the existence of these cities in any future war.

FISCAL SERVICE. A division of the U.S. Department of the Treasury which consists of the following: Office of the Fiscal Assistant Secretary (vacant); Bureau of Accounts (Edward F. Bartelt, Commissioner); Bureau of the Public Debt (William S. Broughton, Commissioner); Office of the Treasurer of the United States (William A. Julian, Treasurer).

FISH AND WILDLIFE SERVICE. In the fiscal year ending June 30, 1943, the Fish and Wildlife Service, so far as possible, devoted its energies to furtherance of the war effort. A conservation bureau that in peace seems to have little if any relation to military affairs, the Service has been surprisingly involved in World War II. Its largest wildlife refuge, the Aleutian Chain, has been the scene of hostilities at Dutch Harbor, Kiska, and Attu. The native populations and administrative staffs of the famed seal islands of St. George and St. Paul were evacuated, the Army taking over. Thus, the seal harvest, ordinarily a large and highly valuable one, was reduced to almost nothing. Returns from sales this year of skins previously collected exceeded \$1,500,000.

Sites aggregating more than 134 million acres were allotted in 35 national wildlife refuges within the United States for Army and Navy training of practically all types. Direct aid was provided also by the transfer of 11 of the larger vessels of the Service's fleet to the Navy, Coast Guard, and Marine Corps. The law enforcement officers of the organization cooperated with Army and Navy intelligence units and with the Federal Bureau of Investigation in collecting evidence of subversive activities. More than half of the Service's qualified personnel was employed in cooperation with war agencies in the appraisal and acquisition of lands needed for war purposes.

Assistance to the war effort was rendered also by controlling rodents on military reservations for the protection of stores of subsistence and clothing, for the safeguarding of airplane landing fields made hazardous by the animals' burrows and soil mounds, and for eliminating rodents menacing the health of troops as disease carriers. The potential economic productiveness of suitable lands on wildlife refuges was taken advantage of to increase lumber yield and fiber, grain, and cattle crops. An increased take of fur was of benefit also in providing material for special clothing for the use of the armed forces in frigid climates.

Cooperative predator and rodent control contributed substantially to the war food program of the nation through reducing the numbers of coyotes and other animals preying upon livestock and of ground squirrels and other rodents destructive to field crops and stored products. In a few cases bird control also contributed to the saving of valuable crops. Methods were improved and success was achieved in finding substitutes for materials that had become scarce or unavailable on account of the war.

Through its activities in connection with fishery industries, the Service was able to contribute materially to maintenance of the vital protein food supply of the nation. This was accomplished by developing new fisheries both at home and in Latin America and in the Southwest Pacific, by encouraging the utilization of hitherto more or less neglected fish and shellfish, and by improving packing methods. To save materials needed in the war, substitutes were developed for metal containers and for the fibers most used for cables and nets.

Every educational medium was employed to encourage the use of fishery products for food, including recommendations as to their cooking. The same service was rendered in connection with domestic rabbits, the production and use of which were

greatly increased.

The conservation activities of the Fish and Wild-life Service were carried on to the full extent permitted by conditions. The national wildlife refuge system was kept intact and under adequate administration and was slightly increased in scope. Federal aid in wildlife restoration continued to the extent possible under limitation of both State and Federal funds. Cooperation in the farm pond fish production program was extended under this and other parts of the Bureau's program and was rendered also in the development of wildlife management on soil conservation districts. Forty-six States and Alaska, Puerto Rico, and the Virgin Islands participated in the program.

Conservation law enforcement activities were continued and the men engaged in them cooperated not only in investigation of offenders against the defense of the nation, as previously mentioned, but also in armed patrol of the vast territory of

Alaska

Research for the most part was upon only a maintenance basis but its results, present and accumulated, were never more required for safe guidance of the regulatory and management activities of the organization. Through a program that has owed much of its success to research, implemented, however, by the national refuge system and conservation law enforcement, the migratory waterfowl have in ten years been restored from a state of precariousness to that of a thriving, growing population, estimated to include about 150,000,000 birds. This is not only a great achievement in conservation but also adds materially to the food resources of the nation. A very large number of excellent table birds can be harvested annually from this great flock without impairing the status of the breeding stock. The history of this resource exem-plifies what the Fish and Wildlife Service aims at for all game species, namely utilization to an extent compatible with sure preservation of stock sufficient to occupy all of the available breeding range the continent affords.

FLAXSEED. Flaxseed production in the United States for 1943 was estimated by the U.S. Department of Agriculture to total 52,008,000 bu. from 5,867,000 acres as compared with 41,053,000 bu. from 4,424,000 acres in 1942, nearly three and one-half times as large as the 1932–41 average production of 14,226,000 bu. The average yield per acre of 8.9 bu. was higher than the 10-year period of 7.8 bu., but below the yield of 9.3 bu. for 1942. The

seasonable average price per bushel received by farmers was estimated at \$2.84 and the value of production at \$147,507,000 in 1943, compared to \$2.86 and \$96,731,000 in 1942. The accompanying table lists the States leading in the production of flaxseed for 1943.

FLIGHT STRIPS. See ROADS; STATE LEGISLATION under Aviation, Highways, and Motor Vehicles.

FLOOD CONTROL. While a number of projects for control of flood waters and protection from floods have been halted or deferred on account of war conditions and emergencies, a committee of the American Society of Civil Engineers has called attention to the importance of this line of civil engineering as affecting public welfare and protection. A line of study preliminary to the design of control works is in the estimating or prediction of flood intensities and flood frequencies in specific areas of the country. Flood hazards have been increased by certain trends towards heavier floods and higher flood levels. There is also a dangerous tendency to continual encroachment upon flood channels and flood plains by private and public works, and unless this is checked by enforcement of zoning laws the above committee considers that there will be little reduction of flood damage in future.

The advisability of clearing flood zones of public and residential buildings and industrial plants is suggested. In view of the heavy annual costs for maintenance and operation of protective works, the creation of new flood hazards should be checked, in order to reduce future demands for protection. The above report states that the public has a false sense of security based upon the number of works

built and projected.

Early in 1943, widespread floods throughout the United States and Canada tested the effectiveness of protective works. Those along the Ohio River proved satisfactory in easing conditions, where gates excluded flood waters and pumps handled internal drainage waters. At Huntington, W.Va., a pumping station with three propeller pumps was put in service to handle the internal drainage from a large area when the normal outlet to the Ohio River was closed on account of floods. This plant is the final item in a project which includes 5 miles of dikes or levees, 7 miles of concrete river-front wall, and several smaller pumping stations.

In the Tennessee River valley, damage by floods caused by extremely heavy precipitation was minimized through the series of dams and reservoirs of the Tennessee Valley Authority. These were so operated that the crest level of the flood was kept at 6 to 8 ft. below the probable height if such regulation had not been in service. This case emphasizes the importance of systematic regulation in the storage and release of flood waters in reservoirs. To stop recurring serious floods in the French Broad River, in the west part of North Carolina, the TVA is to construct a series of 7 dams and levees at a cost of

some \$8,000,000.

Construction work on the Federal program for flood control was started in 1937, and by June 30, 1943, under the direction of the Corps of Engineers, U.S. Army, there had been completed 44 reservoirs and 101 local protective projects, widely dispersed throughout the country. Under war conditions, work has been discontinued on a majority of projects, and in 1943 only three new projects were initiated as having direct value in the prosecution of the war. An act passed in July, 1943, authorized the expenditure of \$10,000,000 for emergency flood-control work necessitated by spring floods,

mainly in the Mid-West areas. This included repair, strengthening, and restoration of levees and other works. Progress is being made on plans for the completion of suspended projects and the carrying out of projects not yet started, which will be available as a construction backlog in the transition from war activities to normal peacetime economy.

For the vast problem of the Mississippi River, the Lucas bill, in Congress, proposed a general increase in the height of the levees, but this would not solve the problem. The Mississippi Valley Association, at its annual convention, urged appropriations for emergency work and preparation of a national program of flood control. A project for the Missouri River includes dams, reservoirs, levees, a 9-ft. navigation channel, and protective works at Kansas City, Omaha, and Sioux City. Damage to flooded lands along the Arkansas River was re-paired by Army troops, including 20 miles of drainage ditches, 10 miles of roads, and the clearing and leveling of large areas covered by flood debris.

A program for the Connecticut River valley, as revised by the Corps of Engineers, U.S. Army, after severe floods in 1936 and 1938, provides for 20 reservoirs on the tributaries of the river, and the construction of levees and other protective works at seven cities. Dams have already formed three of the reservoirs. At Hartford alone there are nearly 8 miles of dikes and flood walls completed, and the Park River, which passes through the city is now carried by a concrete conduit 5,600 ft. long, having two parallel compartments 30 ft. wide and 19½ ft. high. Of three pumping stations planned to handle the surface drainage and storm water within the protected area, two will discharge into the Connecticut River and the third into the conduit.

The Merrimack River is another stream whose control has been studied as a unit,, resulting in plans for a series of dams for flood-control reservoirs. One of the dams, on the Pemigewasset River at Franklin, N.H., was completed in October. It is of the earth-fill type, 180 ft. high and 1,700 ft. long, with eight gates for release of the water as required. Following disastrous floods in 1940, plans were made for protection along the French Broad River and the city of Asheville, N.C. As a postwar project, to be carried out by the Tennessee Valley Authority, it provides for seven storage reservoirs and a levee along the river at Asheville.

As protection for an irrigation development in the southern part of England during floods, a pumping plant has been provided to take care of the internal drainage water. Three screw pumps driven by oil engines of 240 horsepower will discharge the water through a tunnel passing under the river to a convenient outlet.—See AQUEDUCTS; Dams; Floods; Tunnels; Water Supply. E. E. Russell Tratman.

FLOODS. The major flood event of the year was the widespread and record-breaking flood of May 10-24 that embraced the streams in an area of about 200,000 square miles covering seven central States from Oklahoma to Michigan. The most destructive flood in point of view of loss of life occurred August 5 in West Virginia. (See below.) The following is a chronological account.

The temperatures during March were well below normal over most of the country, the exceptions being the Middle Atlantic States, the Pacific coast, and the far Southwest. Subnormal temperatures were most pronounced in Montana. However, in that State, the weather changed abruptly in the last week of the month and unseasonably high

temperatures and chinook effects melted the snow at lower elevations in the Missouri Basin. This snow melt produced the highest discharge of record at Bismarck, N.D., and the highest stages since 1881 were experienced in the Missouri as far downstream as below Omaha, Nebr., in April. The Cannonball, Heart, Knife, and Little Missouri Rivers were running bankful by March 23. On the 26th the water began running into the city of Mandan; about \$600,000 damage occurred. U.S. Highway No. 10 was closed for nearly two weeks and mainline trains could not run west for two days. Damage estimated at \$125,000 occurred on the Cannonball River due to the flooding in Mott, N.D., where about 500 families had to be evacuated. About 500 people in Beulah on the Knife River also had to leave their homes.

The Missouri River was near flood stage from Williston to below Elbowoods beginning March 27 and considerable flooding occurred from the 29th to the 31st in the Williston to Washburn area. The losses were slight. Floods also occurred from Sanish to Washburn on April 1 to April 2 and floods occurred between Bismarck and Washburn from April 1 to April 4, inclusive. More water flowed past Bismarck during this period than in any previous flood on record. About \$150,000 damage occurred along the Missouri River, with the greatest

damage between Bismarck and Sanger.

The April, 1943, flood in the extreme upper Mississippi Valley was caused by the rapid melting of a deep snow cover with the ground still frozen from a long, severe winter. Ice gorges formed at some of the bridges and augmented the discharge when the gorges broke, and the older bridges were carried away and demolished. The crest of the flood reached Minneapolis at 1 a.m. Wednesday with a reading of 17.0 feet, or 1 foot above the flood line, and at St. Paul the peak occurred at 1:00 p.m. Wednesday with a reading of 14.5 feet, or 0.5 feet above the flood line. In the Fort Ripley, Clearwater, and Fridley districts near records for high water were established. At Minneapolis the

crest of 17.0 feet was the highest since June, 1916.
A rather severe flood also occurred in April in the upper Missouri River Basin, resulting almost entirely from the melting of a heavy snow cover. The principal flood contributor was the Yellowstone River, with substantial contributions from small tributaries in the Dakotas. Between Bismarck and St. Joseph, the flood was comparable to that which occurred in 1881. At Nebraska City, Nebr., the Missouri reached a stage higher than the previous maximum stage of record in 1881. The most serious damage probably was in the vicinity of Omaha, Nebr.

Excessive flooding extended over seven States from Oklahoma northeastward to southern Michigan during May, causing great damage in the extensive agricultural and industrial areas of this region. This may be ranked as the outstanding flood event since the great flood in the Ohio Valley of January-February, 1937. Although direct loss of life was relatively small, property and crop damage was especially disastrous. The floods were caused by unprecedented rains which occurred in most areas, in two general storm periods, May 6 to 11 and May 14 to 20.

The extensive, and in many cases record-breaking, floods covered the following States: eastern Oklahoma, southeastern Kansas, Missouri, Arkansas, Illinois, Indiana, and southern Michigan. The Neosho (Grand), Illinois, Verdigris, Walnut, Cimarron, and Poteau Rivers, and the Arkansas River from Tulsa, Okla., to the mouth, in the Arkansas

Basin; the White River Basin in Arkansas and Missouri; the Osage, Grand, and Gasconade Rivers, and the Missouri River from Jefferson City, Mo., to the mouth, in the Missouri Basin; the Illinois, Kas-kaskia, and Meramec Rivers, and the Mississippi River from Grafton, Ill., to New Madrid, Mo., in the upper Mississippi Basin; the entire Wabash River system except the East Fork of the White, and the Maumee River Basin, were the principal rivers affected.

Relatively short-time stage records were exceeded at many places and long-time records were broken at several places. Records which have stood since 1833 were broken in the Arkansas River, the stage at Fort Smith, Ark., reaching a peak of 41.7 feet in the first rise on May 23, against a stage of 38.0 feet in 1833. In the Osage River, the great flood of 1844 was exceeded by about 9 feet at Tuscumbia, Mo., and by about 4 feet at St. Thomas, Mo. At St. Louis, Mo., the Mississippi reached a stage of 38.9 feet on May 24, just 2.5 feet below the maximum stage of 1844.

The flood in the Mississippi during June and July affected only a relatively small area in the vicinity of Cape Girardeau, Mo.; it may reasonably be considered a continuation of the flood of May-June which reached heights that have been ex-

ceeded only in 1844.

Frequent heavy rains over the Kansas River Basin beginning on June 5 and continuing until June 16 caused damaging floods in much of the basin. The greatest damage occurred along the main Kansas River with two distinct overflows. The second crested at Topeka, Kans., at 26.75 feet on June 17, the highest since June, 1935. Below Le Compton, Kans., the stages exceeded the flood of 1935. Dykes in the vicinity of Lawrence were bro-

ken with much damage to lowlands.

The Republican River overflowed its banks between Scandia, Kans., and the mouth from June 11 to 18. The Big Blue and Solomon Rivers overflowed twice. Heavy rains on June 15-16 caused overflows in the Delaware and Big Stranger Rivers in Kansas, the Little Platte in Missouri, and the Nemaha in Nebraska, and in the Missouri River from Nebraska City, Nebr., downstream. At Kan-sas City a stage of 29.1 feet was reached on June 18-19, the highest stage since 1908. Below Kansas City, serious dyke breaks occurred and flooded much farmland.

Moderate floods occurred in the Grand River and Flint River Basins in Michigan during June, the first time in 38 years that flood stages have occurred in the Grand River in the month of June. The loss to prospective crops was estimated at about \$1,000,000 in Ionia County.

The most disastrous flash flood in the history of central West Virginia occurred during the night of Aug. 4-5, 1943, causing the deaths of 23 persons and property damage estimated at near \$1,500,000. The damage was confined to an area approximately 48 miles long, extending from just west of Big Island Run to the upper reaches of Salt Lick Creek, with the maximum width about 12 miles.

Thundershowers, mostly of short duration, occurred about dusk on August 4, throughout the Little Kanawha River Basin. However, these showers were locally heavy in the Burnsville-Copen area. They were followed about three hours later by record-breaking rains accompanied by one of the worst, if not the worst, electrical storms of record.

Generally speaking, the southern tributaries of the Little Kanawha River starting with Long Run and ending with the left Fork of Steer Creek were the highest of record, while from Third Run to and

including Yellow Creek, the northern tributaries crested higher than ever before. On the South Fork of the Hughes River, the tributaries from Spruce Creek to Big Island Run were also as high or

higher than the previous records.

The damage to the land was tremendous. Practically every hill in the flood area was scarred by one or more slides. Every cove showed excessive washes. The scour and fill in the valleys was great for, in addition to the usual gravel fill, sizeable rocks and some boulders were washed from the hill tops down into the valleys. Instead of the usual gulley drainage, observers reported that the run-off was in sheet-form with waves forming in some instances.

The South Fork of the Hughes River ran out rapidly. The body of one of the victims of Big Island Run floated 49 miles in 16 hours. The runout of the Little Kanawha River at Parkersburg was very swift for the two days (5th and 6th), as the Ohio River was in pool above Parkersburg and the navigation dams below Parkersburg had been

lowered in anticipation of this run-off.

FOOD AND DRUG ADMINISTRATION. The impact of war conditions on consumer commodities required intensified efforts in the enforcement of the Food, Drug, and Cosmetic Act to maintain the purity and quality of foods and drugs used by both civilians and members of the armed forces. Of the 1,638 food seizures effected, 1,222 actions involved products that had become filthy or decomposed, usually as a result of inexcusably careless handling and storage. Principal items thus needlessly wasted were cereal and bakery products, butter and cheese, fisheries products, dried fruits, dressed poultry, candy, and shelled nuts. Whenever it was possible, seized food unit for human consumption was diverted to suitable war use, such as animal feed, waste fat, and fertilizer material.

Rationed foods and staples used to supplement

them were kept under continuous surveillance to

prevent debasement which would not only affect the purchasing power of the consumer, but might reduce nutritional values below minimum requirements. With few exceptions, substitute foods are being labeled in a fashion which informs the careful label reader. Among the debased foods seized were salad dressings in which mineral oil had been substituted for edible vegetable oil, coffee "extenders" bearing no resemblance to the flavor and aroma of coffee, undeclared cocoa shells in chocolate products, spices containing from 20 to nearly 50 per cent of starch, "enriched" bread without enriching ingredients, imitation fruit-type beverages masquerading as pure fruit juices, spurious olive oil, nut meats containing pumpkin seeds, and horsemeat from which the dealer had stripped the identifying labels. Low-fat butter led the list of substandard foods seized, with hard, over-mature canned peas second in number.

Attention was given to 2,738 manufacturers of drugs, devices, and vitamin preparations. Unauthorized and perhaps dangerous substitutions for scarce ingredients, and breakdowns of control in manufacturing and packaging by less experienced employees, are two types of possible drug violations resulting from war conditions. Both require constant regulatory surveillance. Increased regulatory attention has been given, also, to the therapeutic claims, directions, and warnings on medicinal preparations with which many persons may attempt self-medication during the shortage of physicians. Seizures of violative drug shipments during the year totaled 287. Items deviating from required standards of potency showed a marked increase over the number of substandard drugs seized in 1942. Under the section of the act providing that no new drug shall be introduced into interstate commerce unless an application has been filed with the Federal Security Administrator establishing that it is safe for use, 148 new-drug applications were permitted to become effective.

Criminal prosecutions based on 1,060 shipments in violation of the Food, Drug, and Cosmetic Act were initiated in 1943 and the courts were requested to enjoin 16 firms from persistent violations. Total fines of more than \$114,000 and 15 jail sentences were imposed on defendants convicted of violations during the year. Eight of the jail sentences were suspended and the remaining seven were actually served or are still being served.

The first Supreme Court decision interpreting a provision of the Food, Drug, and Cosmetic Act of 1938 was handed down in 1943. It clarified and strengthened the powers of the Federal Security Administrator in the promulgation of food standards.

The primary obligation of the Food and Drug Administration to the armed services is to lessen their task of securing wholesome foods and drugs of standard potency. This work has included regular enforcement operations and special examinations at the request of these services. A second type of war work has been the utilization of the equipment and experience of the Administration and the knowledge and skills of its scientists trained in many specialized fields to assist in solving wartime problems.

WALTER G. CAMPBELL.

FOOD INDUSTRY. Food production in the United States in 1943 established a new all-time record. According to government figures, it was 5 per cent higher than the previous record in 1942, and 32 per cent over the 1935–39 prewar average. This indicates an increase in food production during

this war far greater than during World War I. While crops in 1943 were slightly lower than in 1942, livestock exceeded the 1942 figures by a substantial margin, thus accounting for the boost in total food production.

\* Excluding truck crops

Translated into more illustrative figures, these percentage gains represented the following 1943 food production totals: 55,000,000,000 quarts of milk, an increase of 14 per cent over the 1935–39 average; 10,000,000,000 pounds of beef and veal (dressed weight), an increase of 27 per cent; 1,000,000,000 pounds of lamb and mutton (dressed weight), an increase of 13 per cent; 60,000,000,000 eggs (including nonfarm), an increase of 50 per cent; 4,000,000,000 pounds of chicken (dressed weight), an increase of 63 per cent; 13,000,000,000,000 pounds of pork (dressed weight), an increase of 78 per cent; 3,000,000,000 pounds of lard, an increase of 73 per cent; 3,000,000,000 pounds of peanuts, an increase of 125 per cent. Also see Agriculture.

Military Requirements. Military and lend-lease requirements during 1943 took about one-quarter of our total food supply, leaving about three-quarters for the civilian population. This compared with 14 per cent in 1942 and 6 per cent in 1941. Our armed forces are now consuming monthly 328,000,000 pounds of meat, 34,000,000 dozens of eggs, 28,000,000 pounds of butter, 221,000,000 pounds of potatoes, and large amounts of other food stuffs. It is estimated that the average soldier eats approximately five and a quarter pounds of foods per day as compared with three and three-quarters pounds per day for the average civilian.

Food going to lend-lease required 2 per cent of our food production in 1941, 6 per cent in 1942, and approximately 10 per cent in 1943, the increase being due to increased Russian shortages. Russia in the first six months of 1943 received one-third of all lend-lease shipments. Food sent to Russia is almost all for the use of the Russian Army. In "reverse lend-lease" the United States has received considerable amounts of foods from Australia, New Zealand, and the United Kingdom. Through August of 1943, Australia and New Zealand provided for us 90,000,000 pounds of beef and veal, compared to a total of 99,000,000 pounds under outgoing lend-lease shipments. See Lend-Lease Program.

Civilian Supplies. Despite the large war demands, per capita civilian food supplies in 1943 were approximately the same as during the 1935–39 period. Compared with prewar per capita figures, 1943 consumption of pork, eggs, chickens, fluid

milk and cream, lard, margarine, fresh citrus fruit, canned juices, canned vegetables, potatoes, and dry edible beans were larger. On the other hand, per capita consumption of beef and veal, lamb and mutton, fresh, frozen, and canned fish, cheese, butter, fresh and canned fruit, and fresh vegetables were lower than in the prewar period.

According to Department of Agriculture calculations, the 1943 civilian per capita food supply was larger in all of the essential nutrients than in 1935–39 and, with the exception of Vitamin A and ascorbic acid, the vitamin and mineral content of foods consumed in 1943 was at least as high as in 1941 and 1942. The relatively smaller amounts of protein from meat animals were more than offset by record consumption of poultry, eggs, and fluid milk.

Manpower. All phases of the food industry, from production and processing down to distribution, were hard hit by increasing manpower shortages in 1943. To relieve farm labor difficulties, 900,000 workers from villages and cities registered for farm work during May, June, July, and August; 48,500 workers were brought in from Mexico; 4,700 from the Bahamas; and 8,800 from Jamaica. All together 1,750,000 placements on farms were made. Prisoners of war were used to some extent, and where emergencies developed the Army assigned soldiers to harvest crops. Under a special directive issued by the Office of Economic Stabilization, food processors are entitled to price relief to compensate them for the rise in labor costs.

Canning. Insufficient price relief in the face of mounting production costs is held largely responsible for the 1943 reduction in canned food. The 1943 pack was 8 per cent below 1942.

Government requirements from the 1943 pack are now calculated substantially below 1942 requirements, reflecting mainly a large accumulation of stocks in the hands of the armed forces. Some of the Army stocks have already been released for civilian consumption, and both the administration and the food industry are currently trying to develop economically sound procedures

for the disposal of large government stocks during

the immediate postwar period.

Prices and Subsidies. Food price developments in 1943 were a subject of increasing concern. Despite the fact that the rise in food costs since the start of World War II has been considerably less pronounced than during World War I, the accelerated advance in food prices late in 1942 and early 1943 seriously threatened the whole wage-price structure and led to the issuance of the President's "Hold-the-Line" order in April, 1943. (See United States.) Under the Stabilization Act of Oct. 2, 1942, Congress had directed the Government to stabilize the cost of living at the level of Sept. 15, 1942. However, between that date and May 15, 1943, the cost of living rose 6.2 per cent, largely because of an increase in food prices. The most spectacular price gains occurred in fresh fruits and vegetables which rose 58 per cent from September, 1942, to May, 1943, and accounted for over three-fifths of the increase in the entire cost of living during that period.

In order to bring food prices back to the Sept. 15, 1942, level, the Administration suggested the use of price-rollbacks and subsidies. Chief commodities selected for extensive subsidy programs were meat and butter. (Coffee was at first included but dropped later on.) The Reconstruction Finance Corporation (q.v.) undertook to make subsidy payments to processors so that retail costs of these foods might be held down while producers received large enough returns to encourage output.

Toward the end of the year the administration started to put into effect an additional program to reduce retail prices of apples, onions, potatoes, sweet potatoes, peanut butter, lard, and vegetable shortening. A major part of these decreases was to be made possible without the use of subsidies, by means of a reduction in margins. In some instances the Government planned to absorb part of the cost

of transportation, to take direct losses on purchase operations, or to make direct payments.

Under the impact of the intensified subsidy program, the upward movement in food prices both at the wholesale and retail level was brought to a halt, at least temporarily. Price averages showed a moderately declining trend for several months beginning with June. Toward the end of the year this trend once more was reversed, however.

As the year progressed the subsidy issue became one of the hottest political controversies. Strong opposition against the use of subsidy payments developed both in industry and in Congress. President Roosevelt entered this fight by presenting, in a special message to Congress dated Nov. 1, 1943, an outline of the Administration's food program. In this message it was stated that supportprice programs in effect for 1943 under the sponsorship of the Commodity Credit Corporation were expected to cost the government \$350,000,000. In addition it was estimated that the Reconstruction Finance Corporation program for reducing the prices of meat and butter would cost an additional \$450,000,000 per year. Price-support programs in effect during 1943 included the following commodities: Hogs, Eggs, Butter, Cheese, Dry skim and evaporated milk, Chickens, Turkeys, Soybeans for oil, Flaxseed for oil, Cottonseed, Peanuts, Dry beans, Dry peas, American-Egyptian and Sea Island cotton, regular Cotton, Corn, Wheat, Tobacco, and Rice, White potatoes, Sweet potatoes, Vegetables for fresh consumption, Canning crops, Canned vegetables, Apples for processing, Apricots for canning, Figs for processing, Dried apricots, Dried peaches, Dried pears, Dried prunes, Dried raisins, Grain sorghums, Hemp, Castorbeans, Wool, Barley, Sugar beets, Gum naval beans, Wool, Barley, Sugar beets, Gum naval stores, Hay, and Pasture seeds. Not all of these programs involved losses for the

Not all of these programs involved losses for the Government, however. Programs under which losses were expected last year, with the estimates of these losses, were as follows:

Source: President's Food Message, November 1, 1943.

Chief Administration argument for an intensive price support and subsidy program is that such a program offers the best method of inducing farmers to increase production without raising the price for the consumer. Therefore this program is being pushed as one of the chief points in the Administration's anti-inflation drive. Chief opposition arguments are that reliance on subsidies constitutes only a piecemeal approach to the food pricing problem and leaves the most urgent problem of restoring a balanced food price structure unsolved. At the same time it is being disputed that subsidies would substantially help in curbing inflationary trends as they actually would tend to increase consumers purchasing power. At the close of the year the controversy over subsidies was by no means settled, although immediate prospects

were for another compromise between Administration and Congress.

Rationing and Black Markets. The great difficulty in the 1943 food program was to bring about a fair and equitable distribution of available supplies. Difficulties arose specifically with respect to perishable seasonal foodstuffs and with respect to uneven geographic distribution of supplies. Transportation difficulties intensified the distribution problem. Although more equal geographic distribution and more even distribution throughout the year could have been accomplished by the extension of rationing to some of the important foods which are not now rationed, the Administration made it clear that it does not intend to use this method. Instead it is planned that the Government itself will either purchase or otherwise control certain foods or absorb the transportation costs in order to stretch consumption throughout the year and to insure distribution that is fair to all parts of the country.

The Administration believes that such Government activity will go a long way toward stamping out black markets. The administration of the various food rationing programs greatly improved in 1943 if general public reaction can be used as a yardstick to measure their success. However, the fact remains that black markets continue to exist in nearly all rationed commodities. The latest example of the possible rapid spread of black markets occurred in the liquor field where the growing shortages in domestic and imported whiskeys created acute black market conditions. Black market conditions in meats were greatly improved toward the end of the year when supplies increased seasonally. There is general fear, however, that with the anticipated tightening in supplies during the spring of 1944 the black market problem again will become intensified.

Distribution. Food distribution, both at the whole-sale and the retail level, in 1943 was largely concerned with the effect of OPA price ceiling regulations on food distributors' margins. These problems were multiplied following issuance of the "Hold-the-Line" order, which prevented a revision in the food price margin regulations which had been under study for a considerable time. Food price difficulties were one of the chief contributing factors to the pressure which developed against the Office of Price Administration (q.v.) and which finally resulted in a complete reorganization of the price agency.

One of the chief issues responsible for the attacks of industry and Congress against the OPA was the attempt of OPA to introduce mandatory grade labeling for canned foods under the guise of price control. The grade labeling controversy developed into one of the most important industry issues of 1943. It was thrashed out in detail in public hearings before the Boren-Halleck Committee on Brand Names and Newsprint. As a direct result of these hearings, the Taft Amendment to the Emergency Price Control Act of 1941 was passed in July, 1943, which formally prohibited the use of mandatory grade labeling for pricing purposes. As a result, all grade labeling provisions were stricken out of OPA maximum price regulations.

FOOTBALL. Picture a former Minnesota ace starring for Michigan or a man who started the year with the professional Chicago Bears winning national intercollegiate scoring honors and you might get a vague idea of what the 1943 football season was like. The war has changed many things, but nothing more than the gridiron sport, which rode over many handicaps to enjoy a comparatively robust campaign

College football was a game almost entirely for Navy and Marine trainees and it was only through the Navy's policy of permitting cadets in training at colleges to compete in varsity sports that foot-ball survived. The Army refused such permission and those schools without Navy or Marine trainees either abandoned the game or carried on with

their remaining civilian students.

Fordham, Alabama, Stanford, and Syracuse were among the many schools that canceled schedules while a few others such as Harvard and Boston College played only on an informal basis. Ohio State, the No. 1 eleven of 1942; Nebraska, Temple, Pittsburgh, and Indiana had civilian teams and all took beatings week after week, as did Minnesota, Wisconsin, and Columbia, which had little

in the way of manpower.

It was a strange season in which Navy and Marine transfers of national fame performed for new alma maters. Some were shifted in mid-season, a few even appearing twice against the same opponent. Perhaps the most outstanding transfer was Bill Daley, All-America back at Minnesota in '42, who went to Michigan and helped the Wolverines crush the once powerful Gophers and regain the Little Brown Jug for the first time in more than a decade. The play of Bob Steuber, former Missouri star, was another example of what can happen in a war year. Starting the season on the Chicago Bears' squad, Steuber was sent to DePauw as a V-5 trainee and finished the year as intercollegiate scoring leader.

But war or peace, it seems Notre Dame always stands for the best in college football. Almost from the start of the campaign, the Irish, with a number of former Big Ten stars to bolster the strength of a veteran squad, appeared to be the team of the year. Notre Dame rolled along faster with each passing week, overpowering nine rivals; then, in the very last minute of its tenth and last game, disaster struck. With only thirty seconds to play, the Great Lakes Naval Training Station fight-ers let fly a 46-yard pass that toppled the Irish, hailed as one of the great college teams of all time. So it was that Great Lakes, the wonder team of World War I and good enough to tie Notre Dame in 1942, scored the year's biggest upset. With its 19–14 triumph, Great Lakes succeeded where such strong elevens as Army, Navy, Michigan, Northwestern, Georgia Tech, and the Iowa Naval Seahawks had failed.

Despite that setback, Notre Dame clearly earned top-ranking nationally. It swept all before it until the last half-minute of a 600-minute campaign in spite of the fact that Angelo Bertelli, great passer and key man of its T-formation attack, was lost in midseason. Bertelli was called up by the Marines for boot training, being just one of the many players who changed from football togs to service uniforms during the course of the campaign.

Navy, which lost only to Notre Dame and defeated Army for the fifth straight year before a restricted gathering of 15,000, was the leader in the East, trailed by the Cadets, Penn, and Dartmouth. Duke paced the Southern Conference, Georgia Tech led the Southeastern, and Texas the Southwest, while Tulsa won Missouri Valley honors. Oklahoma took the Big Six title and Colorado College annexed Rocky Mountain laurels. The Pacific Coast Conference championship was not decided until Jan. 1, 1944, when Southern California surprised even its most ardent followers by conquering Washington, 29–0, before 68,000 in Pasadena's Rose Bowl. Georgia Tech and Tulsa met at New Orleans on New Year's Day with Tech rallying to triumph, 20-18, in the most sensational game of the Sugar Bowl series as 69,000 persons looked on.

A wartime touch was added to the January 1 contests in a double-header at Oran, where an Army team beat a Navy eleven, 10–7, in the Arab Bowl after the Casablanca Ordnance "Rab Chasers" had toppled the Oran "Termites" by 7–6. The East and West played to a 13–13 tie in the annual Shrine game at San Francisco, Louisiana State beat the Texas Aggies, 19–14, in the Orange Bowl at Miami, and Texas deadlocked Randolph Field, 7-7, in the Cotton Bowl at Dallas.

Notre Dame and Michigan played to the season's biggest crowd, the record number of 86,000, while the Navy and Notre Dame drew 82,000 in their Cleveland meeting. Southern California and the College of the Pacific attracted 75,000 at Los Angeles and 76,000 saw Notre Dame topple the Army in New York's Yankee Stadium. Professional football enjoyed the best season

financially in its history, crowds in every city on the National League circuit setting new marks. The Chicago Bears captured the championship by crushing the Washington Redskins, defending titleholders, by 41-21 as Sid Luckman, former Columbia star, threw five touchdown passes to set a record for league play-off contests. Total receipts of \$120,500 also set a play-off record.

FOREIGN AND DOMESTIC COMMERCE, Bureau of. A Bureau of the U.S. Department of Commerce, charged with promotion and development of United States commerce. Its operations are (1) of a general economic character, such as reviews of broad trends and developments; (2) of specific, practical application to current business problems. It also serves as the direct liaison between American business interests and the Government. However, activities of the Bureau today largely concern the provision of a quick service of comprehensive reports on commodities and industries at the request of war agencies. Director in 1943: Amos Taylor.

FOREIGN BROADCAST INTELLIGENCE SERVICE (FBIS). See Federal Communications Commission.

FOREIGN ECONOMIC ADMINISTRATION (FEA). During 1943 the foreign economic operations of the United States government were consolidated in a single agency—the Foreign Economic Administration.

Established by Executive Order of Sept. 25, 1943, the FEA represents an actual merger of several previously independent administrative units, whose separate identity has been terminated. Foreign economic responsibilities and program operations of these several units are now carried out by FEA. The consolidated agencies are: the Office (Board) of Economic Warfare (to which an Executive Order of July 15, 1943, transferred the United States Commercial Company, the Rubber Development Corporation, the Petroleum Reserve Corporation, the Export-Import Bank, and the foreign economic activities of all other Reconstruction Finance Corporation (q.v.) subsidiaries), the Office of Lend-Lease Administration, the Office of Foreign Relief and Rehabilitation Operations, and the economic operations of the Office of Foreign Economic Coordination. (See the separate articles on Economic Warfare, Office of; Lend-Lease Program; Relief and Rehabilitation.)

Functions of the War Food Administration and the Commodity Credit Corporation, with respect to the procurement and development of food and food facilities in foreign countries, were also transferred to the Foreign Economic Administration by

Executive Order of Oct. 6, 1943.

Leo T. Crowley, as Foreign Economic Administrator, heads FEA. Associated with him in the Office of the Administrator are two Deputy Administrators, several assistants and advisors, and a number of special consultants. Six staff offices, headed by a General Counsel, and five Assistant Administrators, report directly to the Office of the Administrator. The staff offices include: General Counsel, Economic Programs, Organization and Methods, Personnel, Finance, and Management Services.

Down the administrative line are two bureaus—

Down the administrative line are two bureaus—a Bureau of Supplies and a Bureau of Areas. The Bureau of Supplies includes the following Branches and Services—Requirements and Supply Branch, Foreign Procurement and Development Branch, Transportation and Storage Branch, Engineering Service, Statistics and Reports Service, a Trade Relations Staff, and appropriate consolidated commodity divisions. The Bureau of Areas includes the following Branches—General Areas, Pan-American, Liberated Areas, and Special Areas.

In general, the Bureau of Supplies analyzes for-

In general, the Bureau of Supplies analyzes foreign requirements and requisitions with reference to availability of supplies; presents supply claims to the appropriate allocating agencies; arranges for procurement of supplies in the United States, and initiates and administers procurement and development in foreign countries; regulates and expedites the flow of commercial exports; arranges for transportation, warehousing, and redistribution of commodities and materials; and performs other duties as outlined in the Orders. In carrying out many of its activities, this Bureau cooperates closely with the Bureau of Areas, directing its programs within the framework of area determinations.

In general, the Bureau of Areas makes broad program decisions regarding FEA operations in all areas, coordinating such programs and harmonizing them with State Department foreign policy and with military activities and requests; analyzes foreign requirements with reference to area considerations, and assists the Bureau of Supplies in presentations to allocating agencies; is responsible for economic intelligence and analysis work, and for preclusive buying and other economic programs; develops and directs FEA programs for liberated areas, including assigned activities related

to participation in UNRRA operations; supervises FEA field work; and performs other duties as outlined, working closely with the Bureau of Supplies in many of its activities.

All foreign representatives of the various agencies and corporations which have been merged in the Foreign Economic Administration have been placed in the FEA foreign missions, bringing actual consolidation of administrative machinery abroad as well as in the United States. See LEND-LEASE PROGRAM.

FORMOSA (Taiwan). An island near the southeast coast of China, ceded to Japan by China in 1895. Total area, including the Pescadores, 13,889 square miles. Total population (census of October, 1940), 5,872,084. Chief towns (1935 census): Taihoku (capital), 278,446; Tainan, 111,959; Keelung, 84,978; Takao, 83,735. The chief agricultural products are rice (1,750,000 metric tons of rough rice in 1940–41), sugar (798,000 metric tons, 1940–41), tea, sweet potatoes, ramie, jute, and tumeric. Camphor is obtained from the forests under a government monopoly. Livestock (1937): 1,849,195 swine, 282,101 buffaloes, 76,341 cattle, and 70,384 goats. Gold, silver, copper, and coal are the main minerals. Trade (1939): Y408,649,840 for imports and Y592,938,199 for exports (yen averaged \$0.2596 for 1939; \$0.2344, 1940). Budget (1940–41): Y269,457,562. Governor General, Siezo Kobayashi.

As a war measure, the administration of Formosa was unified with that of Japan proper in 1942 and placed under the Japanese Home Ministry. Japanese airports, military centers, and shipping in Formosa were repeatedly attacked by American and Chinese planes based in China during 1943.

See China and Japan under History.

FOUNDATIONS. Great activity in building construction, especially in large buildings for military use and for war industries, has not involved much deep or difficult foundation work. Many such buildings notable for great floor area are only one or two stories high and of light construction, so that their weight can be carried by simple surface foundations. Many of them are intended, also, for a life of only a few years. Where heavy cranes or machines are required, special foundations must be provided independent of those of the building. Furthermore, rapidity of construction has been a leading consideration, avoiding delays incident to foundation works. Even for the great arched

hangars for airplanes, the weight is not critical, and the lateral thrust is taken up by substantial concrete supports or by transverse members beneath the floor connecting the feet of the arches.

Of interest, however, is the construction of concrete footings or surface foundations during extreme winter weather. In all cases, two governing factors are local geological conditions and permissible cost. Earthquake stresses may be a factor in certain localities. At a large ordnance plant, where irregular surface of the site would have required columns sunk to various depths to a suitable stratum, the soft upper soil was removed and re-placed with compacted fill, like an embankment, providing ample support for surface footings.

At shipbuilding docks, consolidation and drainage of soft ground and filling was effected by sand piles. For these, 12-in. pipes were driven, each closed by a loose bottom plate to exclude and consolidate the material. After filling the pipe with sand and gravel, under air pressure, it was with-drawn, leaving the bottom plate and forming a core of firm sand and gravel. In some pipes, a 4-in, perforated pipe was inserted and connected to a pump to drain the soil. In a somewhat similar case for a heavy riverside plant for unloading coal from barges, 18-in. steel tubes with closed ends were driven through soft ground, then cleaned out by compressed air and filled with concrete.

Rapid construction of deep foundations was required for the piers of the Peace River suspension bridge on the Alaska Highway, so that in spite of extremely severe winter weather the piers and steel towers could be built before the ice went out. With ice 41/2 ft. thick, all construction work was carried out upon it, and was finished a few days before the spring break-up of the ice. Another example of special conditions is the Kentucky Dam of the Tennessee Valley Authority, which is located near zones of earthquake disturbances, so that exceptionally massive construction was necessary to

insure stability.

For a power house, with its ponderous machinery, 30-in. steel shells were driven 130 ft. through clay and sand and 10 ft. into solid rock. Each well or shaft was inspected by an engineer lowered into it, and after a steel beam had been set on end, to support a column of the building, the shaft was filled with concrete. To carry the massive concrete deck of a Navy dry dock, built on a submerged site, 54-in. steel shells, similar to the above, were driven to depths of over 100 ft., and after being cleaned and pumped out the shell was filled with concrete placed by pumping through a 6-in. pipe lowered to the bottom of the shell.

Modern foundation work includes many cases of supporting or underpinning existing foundations which have deteriorated with age or are inadequate to prevent settlement. Two such cases in South America are worth noting, At Sao Paulo, Brazil, a concrete 24-story office building, 360 ft. high, had tilted 2 ft. out of plumb owing to disturbance of the ground by excavation for an adjoining build-ing. The sandy soil was consolidated by the freezing process, by means of pipes driven 60 ft. to reach a firm stratum. Shafts 4 ft. in diameter were then sunk through the frozen ground to this stratum and filled with concrete to form foundation piers. At Buenos Aires, Argentina, an extension of the underground railway was so located as to pass under tall and heavy buildings. Before tunneling, shafts were sunk under the buildings to a depth below the future tunnels and were filled with concrete as piers to carry the buildings. When the tunnel excavation encountered one of these piers it was cut away to such a height as to be seated on the concrete arch of the tunnel.

FRANCE. A state of Western Europe. Following the German invasion and the French capitulation of June 22, 1940, the capital was transferred from Paris to Vichy. German and Italian troops remained in occupation of approximately one-half of France (111,910 square miles with about 25,000,000 inhabitants, excluding Alsace-Lorraine) from the commencement of the armistice on June 26, 1940, to Nov. 11, 1942, when the remainder of France

was occupied.

Area and Population. Through the annexation of Alsace-Lorraine by Germany in 1940, France lost 5,605 square miles of territory and a population of 1,915,627 (1936 census figures). This left an area of 207,117 square miles and a population estimated at 40,300,000 in 1940. In 1943 the population of France minus Alsace-Lorraine was estimated at less than 38,000,000. Of the decrease, the excess of deaths over births accounted for about 600,000; emigration, about 400,000; and war prisoners and workers held in Germany for nearly 1,500,000. According to a German source, there were 93,000 more deaths than births in France minus Alsace-Lorraine in 1942. The live birth rate fell from 14.6 per 1,000 inhabitants in 1939 to 13.0 in 1941. The death rate, excluding war losses, was 15.5 per 1,000 in 1989, 18.2 in 1940, and 17.4 in 1941. The infant death-rate was 63 per 1,000 in 1939, 91 in 1940, 75 in 1941, and 70 in 1942.

On the basis of the number of ration cards issued, German occupationary authorities in February, 1941, estimated the population of Paris, with suburbs, at 4,247,957. Populations of the chief cities at the 1936 census were: Paris proper, 2,829,746; Marseille, 914,232; Lyon, 570,622; Bordeaux, 258,-348; Nice, 241,916; Toulouse, 213,220; Lille, 200,-575; Nantes, 195,185; Strasbourg, 193,119; Saint-Étienne, 190,236; Le Havre, 164,083; Toulon, 150,310; Rouen, 122,832; Nancy, 121,310; Reims, 116,687; Roubaix, 107,105; Clermont-Ferrand, 101,128

Colonial Empire. The colonies, protectorates, dependencies, and mandated territories of France had a total area of some 4,617,579 square miles and a total estimated population of 70,000,000 in 1938. For the fate of the colonial empire during the course of World War II, see sections on Government and History below. Also see the separate articles in this YEAR BOOK covering each of the following divisions: Algeria; Cameroun, French; FRENCH EQUATORIAL AFRICA; FRENCH GULANA; FRENCH INDIA; FRENCH INDO-CHINA; FRENCH OCEANIA; FRENCH SOMALILAND; FRENCH WEST AFRICA; GUADELOUPE; MADAGASCAR; MARTINIQUE; MOROCCO; NEW CALEDONIA; NEW HEBRIDES; RÉ-UNION; ST. PIERRE AND MIQUELON; SYRIA AND

Lebanon; Togo, French; and Tunisia.

Religion and Education. With the exception of about 1,000,000 Protestants and a few thousand Jews, the French people profess the Roman Catholic faith. Seven per cent of the population of five years and over were illiterate at the 1931 census. Under the Vichy regime, the educational system was reorganized along authoritarian lines. Physical education, manual training, and religious instruction in the schools were stressed. The law of July 7, 1904, prohibiting members of religious orders

from teaching in public schools, was abrogated in September, 1940. The former system of free secondary education was abolished and the state directly subsidized private (mostly Roman Catholic) schools. A series of decrees issued during 1940 and 1941 deprived the Jews of legal equality and barred them from public offices, professions, journalism, etc.

Defense. By the terms of the armistice of June 26, 1940, the armed forces of metropolitan France were restricted to 100,000 lightly-armed men. This force was disarmed and disbanded when Hitler tore up the armistice agreement in November, 1942. Besides the German occupationary forces, there were in France in 1943 small militia forces used more or less as the private army of Chief of Government Pierre Laval, the unofficial military units organized by the rival pro-German collaborationists, Jacques Doriot and Marcel Déat, and an undergrund patriot army estimated at 50,000 men.

When the Fighting French and Giraudist movements were merged to form the French Committee for National Liberation in June, 1943, the forces under Gen. Charles de Gaulle reportedly consisted of 85,000 troops, 2,500 air force pilots and ground crews, and 49 naval vessels with 6,150 men. Gen. Henri Honoré Giraud had under his command an armed force of between 300,000 and 400,000 men, which was being equipped with American arms, and the remnants of the French Mediterranean fleet. To this naval force was added during 1943 the French squadron that had been interned at Alexandria and other warships neutralized at Fortde-France, Martinique, since June, 1940. See *His*-

tory below.

Production. About 38 per cent of the prewar working population was directly engaged in agriculture, 31 per cent in industry, and 11.5 per cent in commerce. There were 50,148,088 acres of arable land (37 per cent of the total area) in 1937. Yields of the chief crops in 1939, except as stated, were (metric tons): Wheat, 7,150,000 in 1941; barley, 1,357,000; rye, 753,000; oats, 5,271,000; corn, 605,000; potatoes, 14,410,000; beet sugar, 640,000 in 1941–42; tobacco, 33,600. Figures for cereals and potatoes exclude Alsace-Lorraine. The wine production in 1942 was 836,000,000 gal. Livestock in 1939: 2,692,000 horses, 135,000 mules, 185,000 sasses, 15,622,000 cattle, 9,872,000 sheep, 7,127,000 swine, and 1,416,000 goats. An authoritative 1943 estimate placed the decrease in wheat and sugarbeet production from the prewar level at one-third; in vineyard output, nearly one-half; in the number of sheep and cows, about one-fifth; horses, one-sixth; cattle, little if any decrease; hogs, almost 100 per cent.

Mineral and metallurgical production in 1940 was estimated as follows (in metric tons): Coal, 51,000,000 (33,600,000 in 1941); iron ore, 35,000,000; pig iron, 8,000,000; zinc, 10,000; lead, 42,000; bauxite, 700,000; aluminum, 50,000; magnesium, 2,000; petroleum, 496,000 bbl. Production of rayon (q.v.) and staple fiber, 1941, was about 50,000 metric tons; natural phosphates, 82,000 metric tons in 1938. At the beginning of 1942, it was estimated that 60 to 80 per cent of the total industrial output was in execution of German orders. Industrial production in 1943 was estimated to be less than half the prewar output. The whole of French industry was operating at a loss of over five billion francs annually, according to an estimate by the Frankfuter Zeitung.

Foreign Trade. According to French press reports, imports in 1941 totaled about 25 billion francs (46 billions in 1938) and exports 14 billions (30.5

billions in 1938). The Franco-German clearing account for ordinary commercial transactions showed a deficit in Germany's favor of 30 billion francs in 1942.

Finance. Budget estimates of the Vichy Government for 1943, with 1942 estimates in parentheses (in billions of francs): Total receipts, 102 (80); expenditures, 128 (138.4); deficit, 26 (58.4). Expenditure estimates excluded German occupation charges, estimated at 120 billion francs for 1942.

The French internal debt rose from 445,742 million francs on Dec. 31, 1939, to 1,121,000 millions on June 13, 1943. Currency notes in circulation increased from 151,322 million francs on Dec. 31, 1939, to about 427.000 millions on June 30, 1943. Following the armistice of July 26, 1940, the franc was pegged to the reichsmark at the rate of 1 franc = 0.05 reichsmark, or \$0.02 at the German official rate (\$1 = 2.50 reichsmarks). As compared with the previous effective rate, the reichsmark was overvalued about 60 per cent. In unoccupied France, the franc was pegged to the U.S. dollar at 48.90 francs to \$1, or 1 franc = \$0.0228, up to Nov. 11, 1942.

Transportation. At the outbreak of World War II, France had about 26,427 miles of railway line, 393,761 miles of roads, 6,016 miles of navigable waterways, and airlines radiating from Paris to virtually all parts of France and the French Empire. All of these facilities were disrupted by the German invasion in May–June, 1940. See 1943 Year Book for extent of damage. Railway freight traffic for 1942 was about two-thirds that of 1938, but freight-traffic receipts rose by 16 per cent during the same period. Passenger receipts nearly doubled between 1938 and 1942 due to a 65 per cent rise in fares. On June 30, 1939, the French merchant marine comprised 11,282 vessels of 2,952,975 gross tons. About one-third of this tonnage was lost or destroyed by September, 1942.

Government. The beginning of 1943 found metropolitan France under German military occupation with the exception of a small Italian-occupied zone adjoining Italy. The legal government was the authoritarian regime established by Marshal Henri Philippe Pétain at Vichy, which had capitulated to Germany on June 22, 1940, and thereafter entered upon a program of limited but increasing collaboration with the Axis Powers. Under German pressure, Chief of State Pétain had delegated the powers of Chief of Government to Pierre

Laval on Apr. 18, 1942.

The French overseas empire was divided in its allegiance. Martinique, Guadeloupe, French Guiana, Tunisia (occupied by German and Italian forces), and Japanese-occupied French Indo-China professed allegiance to the Vichy Government. Algeria, French Morocco, French West Africa, and the Allied-held districts of Tunisia were controlled by the pro-Allied administration established by Adm. Jean-François Darlan at Algiers on Dec. 1, 1942. Upon the assassination of Admiral Darlan on Dec. 24, 1942, Gen. Henri Honoré Giraud was elected head of the Algiers regime by the Darlan-appointed Imperial Council. With a few minor exceptions, the remainder of the French overseas empire adhered to the anti-German French National Committee, which was established in London in June, 1940, under the leadership of Gen. Charles de Gaulle. His Fighting French movement strongly opposed the policy of capitulation and collaboration with Germany adopted by the Pétain Government in France. For a detailed description of French political developments during 1940–42, see preceding Year Books, especially the 1943

YEAR BOOK, pp. 26-29 and 258 f. For 1943 developments, see below.

#### HISTORY

The resurgence of France began in earnest in 1943, after two and a half years of profound humiliation and suffering under the German heel. Spurred on by the assurance of liberation provided by successive Anglo-American and Russian victories against the Axis Powers, the people of France and the overseas empire united their forces to join with their allies in driving the German invader from French soil.

Giraud Administration. Late in 1942 both de Gaulle and Giraud expressed a desire for the amalgamation of all French forces hostile to Germany. But the obstacles in the path at the beginning of 1943 were great. De Gaulle demanded that Giraud purge all former supporters of the Vichy Government from his regime, annul the Fascist legislation and governing methods introduced in North and West Africa under Vichy, and restore the laws of the Third Republic pending a decision by the liberated French people on their future course. Giraud at first ruled out the idea of political union with the Fighting French movement. He proposed only economic and military union against the Germans, and insisted that the Fighting French military forces in Africa be amalgamated under his command.

At the bottom of these differences in program was a basic divergence between the de Gaullists and Giraudists as to the causes and responsibilities for France's defeat and humiliation. Giraud and the leaders of the French military and naval forces in North Africa placed the primary responsibility upon the politicians and the Leftist tendencies developed under the Republic. De Gaulle, while admitting the necessity of extensive reforms in the Republic, blamed the reactionary, antidemocratic, and pro-Fascist elements in the armed services and in French political and economic life who rallied to Vichy for the failure to continue the struggle against Germany in 1940. There was, in addition, mutual suspicion as to the political ambitions of the rival leaders.

During their meeting at Casablanca January 14-24, President Roosevelt and Prime Minister Churchill brought de Gaulle and Giraud together for the first time but were unable to compose their differences. In fact the gulf between the two French leaders was deepened by the announcement that on January 12 de Gaulle's National Committee had formally accepted the adherence of the French Communist party. This disturbed the more or less conservative elements associated with Giraud. On the other hand the de Gaullists were angered by Giraud's appointment of Marcel Peyrouton, former Vichy Minister of the Interior, as Governor General of Algeria and member of the Imperial Council at Algiers, replacing Yves Chatal

Another source of friction was the arrest of some de Gaullists in North Africa on January 10 in connection with the assassination of Admiral Darlan the previous month. The de Gaullists then asserted that the Darlan shooting was part of a Royalist plot to have the Imperial Council at Algiers establish a French monarchy headed by the Count of Paris. They charged that documents linking de Gaulle's followers with the murder were forged by the Royalist. As a result the de Gaullists arrested on January 10 were released. However the following December 26, on the first anniversary of the execution of Fernand Bomier de la

Chapelle for the assassination of Darlan, high de Gaullist officials at Algiers publicly proclaimed him as one of their martyred associates. An Associated Press dispatch of December 22 from Algiers reported: "Through the year these facts have become apparent: The idealism of the young student, an ardent follower of Gen. Charles de Gaulle, was used by older men who never have been brought to trial. These men supplied the gun and the opportunity to shoot Darlan." At the request of the dead youth's parents, the Commissariat of Justice at Algiers on December 18 publicly denied other charges characterizing him as an Axis agent.

Vichyites Ousted. This friction between the two factions was accompanied by a gradual evolution of the Giraud regime away from the pro-Fascist leaders and principles associated with Vichy to-ward republicanism and closer ideological association with the Anglo-American powers. The trend was opposed in some high French military and political circles and by conservative French landowners and businessmen in North Africa. It was retarded by widespread anti-Semitism instilled by German and Vichy propaganda, and by the need for conciliating the large Arab Moslem population. The attention of both General Giraud and Gen. Dwight D. Eisenhower, the Allied commander-in-chief in North Africa, were centered upon the military struggle for Tunisia, in which both Giraudist and Fighting French troops fought by the side of the British and Americans (see WORLD War). Economic conditions in North Africa were rendered difficult by the resulting strain on Allied communications (see ALGERIA and MOROCCO, under History). But despite these obstacles, Giraud was forced to modify and reorganize his regime by pressure from the Anglo-American governments on the one hand and the reviving republican sympa-thies of the mass of the French population in North Africa on the other.

On February 4 he released unconditionally the 27 Communist Deputies imprisoned in North Africa since the beginning of the war. Working with the Giraudist authorities, an Anglo-American Joint Commission for Political Prisoners and Refugees secured the liberation by the end of June of every one of the thousands of persons held in concentration camps, forced labor gangs, or in retricted residence on Nov. 7, 1942. The Imperial Council was replaced by a "war committee" on February 5. On the same day General Giraud exchanged his title as High Commissioner for that of civil and military commander-in-chief. days later Governor General Peyrouton of Algeria created an elective Council of War Economy to deal with economic problems. He appointed Charles Brunel, former Mayor of Algiers and an ardent de Gaullist, as president of this body. The ban against admitting Jews into combat units of the French army was revoked February 16. In a speech to the Council of War Economy on March 1, General Giraud pledged his adherence to the principles of the Atlantic Charter.

One by one the high civilian and military officials in North Africa associated with the Vichy regime were replaced by anti-Vichyites acceptable to the de Gaullists. On March 15 Giraud accepted the resignation of Gen. Jean-Marie-Joseph Bergeret, deputy civil commander-in-chief in French North Africa and long considered the chief anti-Allied and pro-Vichy figure in Algiers. In a speech before the Alsace-Lorraine Society in Algiers on March 14 Giraud pledged the restoration of the democratic republican regime. He offered full cooperation with de Gaulle on the basis of republi-

can principles, and promised that once victory was won the French people would construct their "provisional government" according to the laws of the Third Republic.

In line with these promises, Giraud on March 16 banned all public pictures, signs, and slogans bearing the name or picture of Marshal Pétain. Decrees ending discrimination against Jews and Masons, restoring the local elected assemblies in North Africa, and banning all other Vichy legislation contrary to the laws of the French Republic were issued March 17. At the same time the Cremieux decree of Oct. 25, 1875, making the native Jews of Algeria automatically citizens of France, was abrogated as a form of discrimination against the Arabs, who were required to make formal application for citizenship. See Algeria

Giraud-de Gaulle Negotiations. The liberalization of the Giraud regime in North Africa proceeded simultaneously with the negotiations between Giraud and de Gaulle for unification of their forces. In these discussions Gen. Georges Catroux, Fighting French Delegate General for Syria and Lebanon and a member of de Gaulle's Council for Defense of the Empire, served as permanent liai-

son officer between the two movements.

On February 23 de Gaulle's National Committee in London proposed the absorption of the Giraud administration for North and West Africa within the framework of the Committee, which they offered to enlarge "in accordance with new conditions." While ignoring the proposal that he accept a subordinate position under de Gaulle, Giraud accepted most of the principles espoused by the National Committee in his speech of March 14. A meeting between the two leaders was then arranged for early in April. But on the eve of de Gaulle's departure for Algiers it was reported that General Eisenhower had asked him to delay his trip indefinitely. Apparently the Anglo-American military and political representatives in North Africa expected that de Gaulle's arrival might precipitate a political crisis behind the lines when the battle for Tunisia was reaching a climax. Immediately afterwards the usual Sunday inter-Allied parades in Algiers were suspended because of political demonstrations by de Gaulle's supporters.

Two main points of divergence still remained between the two leaders—the retention of some former Vichy collaborationists in high positions under Giraud, and the opposite views held by Giraud and de Gaulle as to the provisional regime to be established pending the restoration of constitutional government in France. Giraud wanted a council made up of colonial governors and commissioners working in close collaboration with the military commander, who would be responsible for administrative functions and police powers in each liberated department of France. De Gaulle insisted upon an organization that would give representation to the French underground and control

all military and colonial authorities.

A compromise solution on these questions was reached through Giraud's proposal of May 17 which was accepted by the French National Committee in London on May 24. Under this agreement Giraud and de Gaulle each named two other conferees, and these six designated one other by majority vote when they met for the first time in Algiers on May 31. The committee consisted of the two leaders plus André Philip and René Massigli (nominated by de Gaulle), and Jean Monnet and Gen. Alphonse-Joseph Georges (nominated by Giraud). These six selected General Catroux as

the seventh member. It was agreed in advance that this committee would administer French affairs within its sphere of control until all of France was liberated.

Meanwhile the growth of political partisanship among the adherents of de Gaulle and Giraud in French North Africa threatened to disrupt the efforts at unification. The Fighting French leader's popularity had been rapidly rising throughout North Africa, and apparently also in underground circles in France, as the victories of the Allies in Tunisia and elsewhere justified his course in 1940 and elevated him into a symbol of tenacious and successful French resistance. De Gaulle aggressively utilized this popular support to win a dominating position in the newly formed committee. At the first meeting on May 31 he demanded the immediate dismissal by General Giraud of Peyrouton, Noguès, and Boisson and the purging of other former Vichy adherents from leading civil and military positions before the governing committee was

formally constituted.

Giraud contended that these issues should be decided after the constitution of the committee. At this point Governor General Peyrouton on June 1 forestalled dismissal by sending separate notices of his resignation to Generals Giraud and de Gaulle. For some unexplained reason his resignation did not reach Giraud for many hours after it was received and accepted by de Gaulle, who acted without referring the question to Giraud. This move made it appear as though de Gaulle had won control of the committee. Giraud countered by declaring that the committee had not yet been constituted and by asking Peyrouton to retain his post until the committee was legally able to act upon his resignation. His position was sup-ported by the American and British Ministers in Algiers.

Committee of National Liberation. After three days of debate over the de Gaulle demands, the seven members of the committee formally constituted themselves as the French Committee of National Liberation on June 3. Giraud and de Gaulle were named co-presidents. General Catroux, who retained membership on the Committee, was appointed Governor-General of Algeria to succeed Peyrouton and Commissioner for Coordination of Moslem Affairs. In a statement issued the same day the Committee assumed the functions of the "French central power," including direction of "the French effort in the war in all forms and in all places," the exercise of "French sovereignty on all territories placed beyond the enemies' power," the administration and defense of all French interests in the world, and "authority over the territory, and the land, naval, and air forces which have up to the present time been under the authority of either the French National Committee or under the civil and military commander-inchief.

The statement pledged the Committee to "turn over its powers to the temporary government which will be constituted in conformity with the laws of the Third Republic as soon as the liberation of the metropolitan territory permits it, and, at the latest, at the total liberation of France." It further bound the Committee "to reestablish all the French liberaties, the laws of the republic and the republican regime, completely destroying the arbitrary regime and the personal power that is imposed on the country today.'

A Cabinet of 14 commissioners to govern the French Empire under the direction of the Committee of National Liberation was named June 7, as follows: Co-chairmen, Generals de Gaulle and Giraud; Foreign Affairs, René Massigli; Production and Commerce, André Diethelm; Labor and Social Affairs, André Tixier; Colonies, René Pleven; Interior (director of underground organizations in France), André Philip; Moslem Affairs, General Catroux; Justice, Education, and Public Health, Dr. Jules Abadie; Communications and Merchant Marine, René Mayer; Finance, Maurice Couve de Murville; Armament, Supply, and Reconstruction, Jean Monnet; Information, Henri Bonnet; Commissioner without portfolio, General Georges. Six of the new commissioners named were members of de Gaulle's Fighting French movement.

Meanwhile the purge demanded by General de Gaulle proceeded apace. General Noguès resigned as Resident General of Morocco June 5 and Governor General Boisson of French West Africa followed suit late in June. The Committee of National Liberation named Gabriel Puaux, Fighting French High Commissioner for Syria and Lebanon, to replace Noguès and appointed Jean Helleu to Puaux's former post. Pierre Cournarie, Governor General of French Cameroun, replaced Boisson at Dakar. A considerable number of other civil and military officials of pronounced pro-Vichy leanings

were forced out.

Army Reform Issue. General de Gaulle's insistence that this purge should be extended to include numerous officers of the French army in North and West Africa brought another collision with Giraud. A deadlock ensued which persisted throughout June and threatened to disrupt the Committee of National Liberation. De Gaulle made a determined effort to deprive Giraud of the command of the French forces in North Africa or to obtain for himself the post of Minister of Defense with authority over Giraud as army commander. When it appeared likely that a majority of the Committee would support de Gaulle, General Eisenhower intervened.

With the approval of the British and U.S. Governments, he informed the Committee that he could not permit sweeping military reforms affecting the French North African forces nor the replacement of Giraud as their commander. The responsible Anglo-American authorities took the position that they could not risk politically-inspired changes that might impair the efficiency of the French forces while North Africa was being used as a base for combined Allied operations directed

at the liberation of France.

The Anglo-American intervention was deeply resented by many de Gaullists and even by some supporters of Giraud as an unjustified infringement of French sovereignty. A temporary solution of the political deadlock was reached June 22 when the Committee of National Liberation agreed to retain Giraud as commander-in-chief of French forces in North and West Africa and de Gaulle as commander of all other forces of the Empire. A permanent military committee was created to coordinate the armed forces under Giraud and de Gaulle and supervise their rearmament. Immediately thereafter Giraud, with the Committee's assent, visited the United States for military discussions involving the equipment, supply, and use of the French forces under his command. The reequipment of Giraud's forces of some 300,000 men with the latest American arms had begun late in 1942.

Following Giraud's return from the United States and Canada, and a new flare-up within the Committee over the actions taken by the permanent military committee during his absence, a more permanent solution of the military issue was reached on July 31. The Committee appointed Giraud as commander-in-chief of all French forces and named de Gaulle as permanent chairman of a new Committee of National Defense consisting of de Gaulle, Giraud, Gen. Paul Le Gentilhomme, a Fighting French officer who became Assistant Commissioner of National Defense, and the army, navy, and air force chiefs of staff.

In a communiqué issued the same day, the Committee of National Liberation defined the specific powers of its co-chairmen. Giraud was to direct discussions and execute decisions concerning national defense. De Gaulle was to preside over discussions and execute decisions in all other matters. The communiqué stated that the Committee "directs the general conduct of the war and disposes of all land, naval, and air forces." It also stipulated that Giraud would cease to exercise the functions of co-chairman during such time as he exercised an effective operational command. As commander-in-chief of the armed forces, Giraud was made responsible to both the Committee of National Liberation and the Committee of National Defense.

Committee's Position Strengthened. With the crucial question of the army command disposed of, the Committee of National Liberation proceeded to consolidate its position as the governing agency for all liberated French territories. The balance of power between the Giraud and de Gaulle factions was held by a group of moderates, who worked to limit the personal ambitions and powers of both leaders and bring them under the undisputed control of the Committee. When Giraud's army officers in Algeria attempted to curb de Gaullist press criticisms of the Allies and of some of Giraud's associates, the Committee on July 1 stripped Giraud of the police powers that he had assumed under the State of Siege Law of 1849 and delegated them to General Catroux, the Governor-General.

On July 6 the Committee dissolved Jacques Doriot's notoriously pro-Fascist French Popular party as well as the obligatory organizations of producers and merchants created in North Africa by the Vichy Government. In August it was decided to create a provisional consultative assembly to review the Committee's policies and actions. Mobilization for the war effort of all French citizens and subjects within and without the Empire was voted September 3. At the same time responsibility for maintaining order in North Africa was transferred from Giraud's military command to Governor General Catroux of Algeria and the Resident Generals of Morocco and Tunisia. The resistance movement in metropolitan France was given direct representation on the Committee September 6, when it was enlarged to include François de Menthon, co-director of one of the two largest underground organizations.

De Gaulle Establishes Primacy. Another step in the progressive whittling down of Giraud's authority followed on September 28. The Committee of National Liberation named General Le Gentilhomme as Commissioner for National Defense and gave him direct command of all nonoperational French military forces (garrisons and other static units) while leaving Giraud in control of strictly operational forces. On October 18 Jean Monnet resigned as Commissioner of Rearmament—which post was abolished—to concentrate on relief and rehabilitation problems.

Late in October the arrival in Algiers of delegates from the French underground organizations to the provisional consultative assembly gave

marked impetus to the de Gaulle boom. The resistance delegates, who were predominantly Leftists, reported that sentiment among patriotic Frenchmen was strongly de Gaullist. They were critical of Giraud's unwillingness to disavow publicly all ties with Vichy, and demanded a speeding up of the purge of former Vichy supporters in the territories controlled from Algiers.

The sentiment manifested by the Consultative Assembly after its convening on November 3 paved the way for the emergence of de Gaulle as the virtually undisputed leader of French resurgence. On November 6 Giraud resigned as co-chairman of the French Committee of National Liberation, leaving de Gaulle as the sole head. Giraud received an explicit guarantee that his position as military commander-in-chief was in no way impaired by his changed political status. But in a thorough shake-up of the Committee effected on the same date three of the Commissioners originally nominated by Giraud were eliminated and four additional posts were created and filled with direct representatives of the resistance movement in metropolitan France. The new 17-man Committee was overwhelmingly de Gaullist.

Those dropped were Generals Georges and Le Gentilhomme, Maurice Couve de Murville, and Dr. Jules Abadie. The new appointees were André Le Trocquer (Socialist), Commissioner for War and Air; Louis Jocquinot (Democratic Alliance), Navy; Emmanuel d'Astier de la Vigerie (leader of one of the largest French underground organizations), Interior; René Capitant (leader of the Combat resistance movement in North Africa), Public Health and Education; Pierre Frenay (resistance leader in France), Deportees and Prisoners of War; General Catroux, André Philip, and Henri Queuille (Radical Socialist), Commissioners

without portfolio.

General de Gaulle on Novembr 10 declared that the reorganization of the Committee assured acceptance of its authority by the French people. He emphasized that the Committee's authority extended "to all Frenchmen and in particular to all French forces and their chief." In an interview with a New York Times correspondent the next day, Giraud took occasion to state that he had no ties with Vichy and no reason to have them. During the remainder of the year there were recurrent reports of friction between General Giraud and some of his principal commanders on the one hand and the Committee, particularly the new Commissioner for War and Air, on the other. Giraud, in a fight to retain unhampered control of the military organization, repeatedly offered his resignation.

On December 6 it was revealed that Commissioner Le Trocquer had ordered Gen. Pierre Koenig, de Gaullist commander who won fame at Bir Hacheim, and at least two other generals confined to their quarters for short periods. It was reported that the dismissal of Lieut. Gen. René Bouscat, Chief of Staff for Air, had been prevented only through the intervention of Anglo-American commanders in North Africa. A new and important military figure entered the Algiers scene on December 22, when Gen. Jean de Lattre de Tassigny escaped from France and offered his services to General de Gaulle. The general was sentenced by the Vichy Government to 10 years imprisonment for attempting to resist the German occupation of southern France in November,

Plans for New French Regime. As the year ended the Committee and the members of the Consulta-

tive Assembly were working on plans for the restoration of French independence in the wake of the expected Anglo-American invasion. The original proposals of the Committee, coupled with the partial restriction of the freedom of the press in North Africa in December, aroused suspicions in some quarters that de Gaulle was aiming at dictatorship. However some members of the Committee and of the Consultative Assembly appeared determined to avoid the imposition of a de Gaullist regime except with the consent of the French electorate.

Differences between de Gaulle and the French Communist party representatives in North Africa developed late in the year, raising the prospect of possible civil war in liberated France unless the breach were healed. The Communists had six delegates in the Consultative Assembly and were offered one or two places on the Committee of National Liberation. However de Gaulle rejected their demand for the appointment of a Communist selected by party officials to the Commissariat of Information. At the year's end the Communists were pressing the Committee to set itself up as the provisional government of France and to broaden its base by admitting members of the Communist party and the French General Federation of Labor.

Commission of Purification. In a fiery speech at Casablanca on August 8 General de Gaulle promised that France would punish as traitors "those so-called leaders who rushed headlong into capitulation in June, 1940." A Commission of Purification was set up by the Committee of National Liberation August 12 "to provide adequate sanctions against those elected persons, civil servants, or public agents who, since June 16, 1940, have by their acts or their general personal attitude either favored enterprises of the enemy or harmed the action of the United Nations and of resistant Frenchmen, or attacked constitutional institutions or fundamental public liberties, or knowingly drew or sought to draw direct material benefit from the application of Vichy regulations.

On recommendation of the Commission of Purification, the Committee of National Liberation subsequently ordered the arrest and trial of a considerable number of former Vichy officials. Among the leading personalities awaiting trial on treason charges at the end of the year were Pierre Pucheu and Marcel Peyrouton, former Vichy Ministers of Interior; General Bergeret; Pierre-Etienne Flandin, former Premier of France; Pierre Tixier-Vignancourt, former Vichy Secretary of Informa-tion; General Boisson; and André Albert, a former Deputy. According to the Commissioner for Justice, these arrests were preventive and the prisoners would not be tried until after the liberation

of France.

A number of military, naval, and civilian officials charged with facilitating the entrance of Axis forces into Tunisia in November-December, 1942, were also arrested. On September 3 the Committee of National Liberation announced that Marshal Pétain and all the members of his "pseudo-govern-ment" would be placed on trial at the first opportunity. Two French rear admirals who failed to cooperate with the de Gaullist and Allied forces were forced into retirement December 8. They were François Michelier, commander of French naval forces at Casablanca at the time of the American landing, and René Emile Godefroy, commander of the French fleet interned at Alexandria in 1940–43. The Committee on December 18 decreed the dismissal or retirement of all civil administrators and army and navy officers who were former members of "anti-Allied organiza-

tions" hostile to de Gaulle.

Empire Developments. With the German-Italian occupation of southern France in November, 1942, and the Allied military victories of the following spring, French colonial officials, diplomats, and military men who had remained loyal to the Vichy Government shifted their allegiance to either the Fighting French or to Giraud. Formation of the Committee of National Liberation terminated acute rivalries in some of the colonies between the de Gaulle and Giraud factions (see French Guiana and Martinique under History). The day Tunis fell to the Allies (May 7), the French naval squadron that had been immobilized at Alexandria since the fall of France went over to General Giraud. This added one battleship, four cruisers, three destroyers, and one submarine to the United Nations naval strength.

Relations with Britain and U.S. The formation of the Committee of National Liberation and the subsequent settlement of the controversy over military reforms opened the way for limited recognition by the British and American Governments on August 26. Ever since its creation, the Committee had sought Anglo-American recognition not as the provisional government of France but as the organization qualified to insure the administration and defense of all French interests. However President Roosevelt recognized the Committee only "as administering those French overseas territories which acknowledge its authority." Moreover he made recognition conditional upon (1) the Committee's cooperation with the U.S. Government in the liberation of France, (2) its functioning "on the principle of collective responsibility of all its members for the active prosecution of the war," and (3) its acceptance of policies determined by the military requirements of the Allied commanders.

The Committee, Mr. Roosevelt stated, was not recognized as a government of France or of the Empire. He declared that "later on the people of France, in a free and untrammeled manner, will proceed in due course to select their own government and their own officials to administer it." The British note of recognition was similar in content but less blunt. On the other hand the Soviet Government recognized the Committee as "the representative of the State interests of the French Republic and leader of all French patriots fighting against the Hitlerite tyranny." This was much more in line with the Committee's wishes. Recognition by most of the other United Nations preceded or followed the Anglo-American action.

The terms of the Roosevelt recognition statement in particular reflected the coolness and even suspicion with which Anglo-American governmental circles regarded General de Gaulle. They attributed much of the difficulty experienced in obtaining French cooperation in the prosecution of the war to de Gaulle's alleged political ambitions and dictatorial tendencies. De Gaulle's supporters replied that he could not work with the pro-Fascist elements in the Darlan-Giraud administration without opening the door to fascism in postwar France. In June the British reportedly suppressed the de Gaullist weekly organ in London for its bitter attacks upon Anglo-American policy in North Africa.

After the Casablanca Conference, Anglo-American policy toward the French factions remained unified (see Great Britain under *History*). De Gaulle protested on September 12 against the exclusion of the Committee from the negotiation and

signing of the Italian armistice. However Committee representatives were consulted regarding the armistice terms, which provided for the handing over of Corsica to the Allies and Italian evacuation of the French Riviera. In mid-September the British and U.S. Governments invited the Committee to name a representative to the Allied Armistice Commission in Italy. A U.S. lend-lease and reciprocal aid agreement formalizing the economic relationships between French North and West Africa and the United States was signed September 25. On November 18 the Committee made an additional \$15,000,000 payment to the United States for civilian supplies furnished French North Africa, raising the total sum paid for such supplies to \$56,340,000.

Allied acceptance of Italy as a co-belligerent in mid-October aroused further criticism from members of the Committee. Immediately afterwards de Gaulle and René Massigli conferred with Secretary of State Hull and Foreign Secretary Eden when they passed through Algiers en route to the Moscow Conference. De Gaulle again urged the admission of the Committee to the ranks of the United Nations. Following announcement of the results of the Moscow Conference (see United Nations), the Committee on November 5 formally served notice that France would not consider herself bound by any decisions concerning Germany reached by the Allies without French par-

ticipation.

Soon afterward further friction arose between the Committee and the Anglo-American governments over French repression of the independence movement in the Republic of Lebanon (see Syria And Lebanon under *History*). Under strong British and American pressure, this issue was tided over to the satisfaction of the various parties concerned. The year end found de Gaulle and the American Government still at odds over the terms under which the French Committee would enter France in the wake of invading Anglo-American armies. The British Foreign Office was said to favor acceptance of de Gaulle's view that the Committee should now be recognized as the provisional government of France.

Meanwhile Anglo-American forces in September had assisted French patriots and French troops landed from North Africa in restoring Corsica (q.v.) to French sovereignty. Through U.S. lendlease aid, divisions of French and colonial troops in North Africa were equipped with modern arms and trained to take part in the coming invasion of France. On December 17 it was announced that French troops had taken over a sector of the Allied

front in Italy.

Developments in France. Meanwhile in metropolitan France, patriot elements from all political parties and classes fought to prevent the Germans from enlisting French manpower and material resources to strengthen and defend Hitler's "European fortress." As in the preceding two and one-half years, the main phases of this many-sided struggle were (1) the measures taken by the Vichy Government on instructions from Berlin to carry out the German program, (2) the measures applied directly by the German military authorities, and (3) French resistance to both the Vichy Government and the German army.

Pétain's Role. Though continuing in office as Chief of State, Marshal Pétain played an insignificant role in French politics in 1943. He was now 87 years old. His once great prestige among the French people had been shattered by his acceptance of Pierre Laval (see Government above) and of the pro-

German and pro-Fascist policies for which the latter stood. Moreover he had surrendered most of his dictatorial powers to Laval in his Constitution-

al Act of Nov. 18, 1942.

In a radio broadcast on April 4, immediately following an American air raid on the Renault war factories in the Billancourt suburb of Paris, Pétain reiterated his determination "to give to France that regime of authority that is advised by the intelligence of the wisest and the common sense of the masses." He warned against the republic and its leaders and the dangers of "Communist barbarism," and protested the "unjustifiable Anglo-Saxon (air) attack." In June he issued a decree closing the session of the specially constituted Supreme Court of Justice at Riom, although the suspended trials of the leaders of the Third Republic were still uncompleted (see 1943 Year Book, p. 259).

On November 13 Pétain was prevented by the Germans from delivering a radio broadcast to the French nation. The text of this undelivered address was smuggled into Switzerland soon afterwards by the Marshal's agents. In it, Pétain said that if he died before ratification of the new Constitution, which the National Assembly entrusted him with drafting on July 10, 1940, the constituent power should revert to the National Assembly. He included in his address the text of a decree carrying out this mandate, which was to have been published on the following day in the Vichy's Official Journal but which was likewise blocked by the Germans, apparently with the approval of Laval. In recognizing the ultimate authority of the National Assembly, Pétain ignored Laval and made a bid for republican support. After being barred from the air, Pétain apparently went "on strike" against the Germans. He took no further part in affairs of state until Christmas Eve, when he broadcast an appeal to Frenchmen to end sabotage, factional quarreling, and resistance to the Vichy authorities, which he said threatened to engulf France in civil war.

laval's Administration. Ignoring Pétain, the Germans used his Chief of Government, Laval, as their principal tool in extending the labor conscription program introduced in 1942, controlling French economic resources, and enlisting Frenchmen in the armed conflict with the United Nations, Laval had important conferences with Hitler at the end of December, 1942, and on the following April 29, at which he received his instructions, particularly as to the number of French workmen to be drafted for work in German factories. Laval's proposal for a permanent peace treaty to give France the status of a partner in Hitler's "new order" was curtly rejected. No formal arrangement was made to replace the German-French armistice annulled by Hitler on Nov. 11, 1942, with the result that the Vichy regime existed on mere tolerance as an arm of the German military administration.

Within this tottering structure, Laval continued his desperate struggle to hold his position and power against rival aspirants for Hitler's favor, such as Jacques Doriot, and the intrigues of members of his Government who were unwilling to accept him as the de facto successor to Pétain. This struggle was marked by Laval's repeated shakeups of his Cabinet, in each of which he concentrated more authority in his own hands; the widening of his grip over the police; the reported arrest in May of 150 Vichy officials and other Frenchmen accused of plotting to overthrow Laval; and the arrest by the Gestapo of members of the entourages of both Laval and Pétain who were suspected of going over to the anti-Vichy forces in France.

These defections increased after the formation of the French Committee of National Liberation in Algiers, and after the Allied invasion of Italy paved the way for the expected landings in France. To curb the growing spirit of defiance and resistance among the populace, Laval early in August issued new and more stringent regulations restricting the

right of assembly in public places.

A series of Vichy decrees extending the labor draft goaded the French people to the verge of open rebellion. Laval's militia and police forces aided the German press gangs in rounding up increasing numbers of French workers for labor in German war factories or on fortifications in France. Youths between 20 and 22 were ordered conscripted in February. Toward the end of March the age limit was extended to include those be-tween 20 and 31. Every Frenchman between 18 and 50 was required to carry a certificate of employment; those caught without such cards after April 20 were subject to deportation to the Reich. All opposition to the draft was treated as "communistic agitation" and crushed by the Vichy police and the Gestapo through arrests and internment. Vichy sources placed the number of French workers sent to Germany during the first quarter of 1943 at 250,000. On June 5 Laval announced over the Paris radio that he had agreed to send 200,000 more workers to Germany between March 1 and July 1. To do this, he ordered the military class of 1942 mobilized "for work." By the middle of 1943 it was estimated that 900,000 Frenchmen were at forced labor in Germany in addition to some 1,250,000 French prisoners of war.

Laval in January dissolved Marshal Pétain's Tricolor Legion and formed a new militia organization under his direct command, organized and uniformed like Hitler's Elite Guard. The Germans, however, restricted Laval's private army to the former free zone in southern France. In the occupied zone delimited in the 1940 armistice, the French Nazi storm troopers organized in separate armies by Doriot and by Marcel Déat, chief of the collaborationist National Revolutionary Front, were left undisturbed. A number of Frenchmen joined Laval's militia for the purpose of escaping the German labor draft. But the militia soon became engaged in a vicious, bloody warfare with underground patriot organizations. Many of the militia leaders were assassinated. Attacks upon its members were of daily occurrence. Supported by the Gestapo and German occupation troops, the militia retaliated with wholesale arrests and numerous shootings. Vichy authorities announced December 28 that between October 1 and Christmas Eve the

police made 21,651 arrests.

The same day the German Ambassador to Vichy, Otto Abetz, reportedly demanded that Pétain reorganize the Laval Government to include Marcel Déat as Secretary of Interior. Déat was expected to deal more sternly with anti-German saboteurs and terrorists. Laval headed off his rival on December 30 by reshuffling his Cabinet and entrusting three of his adherents with the task of suppressing the underground. He appointed Marcel Lemoine, former prefect of Marseille, as Secretary for Interior; Joseph Darnand, chief of the militia, as Secretary for Maintenance of Order; and Leon Parmentier as Director General of national police.

Direct German Rule. Large-scale deportations of French youths to Germany were regarded as part of the German plan to prevent the rallying of the French nation to the assistance of an Allied invasion. In addition, the Germans seized more prominent French men and women as hostages, among

them the wives of Generals Giraud and Bergeret. On April 5 the German Foreign Office announced the removal to Germany "for military reasons" of former Premiers Daladier, Blum, and Reynaud, of General Gamelin, and of former Minister of Interior Georges Mandel, all of whom had been imprisoned by the Vichy Government. Ex-Premier Herriot was reported arrested and removed to the Reich in May, and in August the same fate befell Albert Lebrun, former President of the French Republic. The death of Mandel in a German concentration camp was reported from London June 5. Pétain was reported early in November to have secured Lebrun's release.

In Alsace and Lorraine, which had been formally incorporated in the German Reich, a process of ruthless Germanization continued against the stubborn opposition of the predominantly pro-French population. Special German courts sentenced numerous individual Frenchmen and in many cases whole families to imprisonment, death, or deportation. The German civil code was introduced at the end of February. Thousands of Alsatian youths were conscripted for service in the German armies and sent to the Russian front, where many perished. In July the Germans decreed the death penalty for all adult saboteurs and forced labor for minors caught cutting telephone and telegraph

wires

Early in January the German military authorities in southern France established a closed zone along the whole Mediterranean coast and began the construction of fortifications in depth. Hitler made inspection of his "Atlantic wall" defense in May and appointed a new commander of the northwestern region. The pro-Axis French military units were trained to assist the German occupation forces in resisting invasion and crushing internal risings. After the fall of Mussolini and the capitulation of Italy to the Allies, the Germans took over the task of guarding the Savoy and Riviera districts adjoining the Italian border that had been under Italian occupation. Meanwhile they continued the systematic looting of the scanty French food supplies through Vichy decrees conscripting grain and other crops.

Spread of Resistance. Goaded by hunger and oppression and inspired by the growing hope of early liberation, the French became more open in their defiance and more active in their underground warfare upon the Germans and their collaborators. Revolt flared in the Old Harbor area of Marseille in January when the Germans ordered the evacuation of the 40,000 inhabitants of the district. Some 300 men and women were killed by German artillery fire before the district ended armed resistance and submitted to the order. More effective was the resistance of patriot guerrilla bands that sought refuge from the labor draft in the mountains of the Haute Savoie and successfully fought off German and Vichy forces sent to round them up.

From all over France came almost daily reports of intensified bombings and shootings of German soldiers and pro-German French leaders and the large-scale sabotage of German communications. According to Fighting French sources in close contact with French conditions, the underground movement was now well organized and equipped with modern arms and supplies, some of which were dropped from Allied planes. Sections of Paris were placed under martial law in mid-August after street clashes between German troops and patriot bands.

The German authorities continued their efforts to crush resistance by wholesale executions of hos-

tages, innumerable arrests and deportations, the imposition of large fines on communities, and various other methods. The number of Frenchmen killed by German firing squads alone was estimated at more than 50,000. Late in August Marshal Gerd von Rundstedt, German military commander in western Europe, notified the Vichy Government that he was prepared to take "the sternest measures" to prevent a popular uprising in the event of an Allied invasion.

Meanwhile the various French underground organizations had formed a Council of Resistance to unify and coordinate their efforts. They were reported to have experienced a rapid gain in mem-bership and strength and to have organized an "army" of some 50,000 men. They were also said to have agreed upon the following basic principles for the reconstitution of France as an independent nation: No dictatorship or authoritarian government, no "direction" by foreign powers, no connection between a French political party and a foreign nation, and the election of a National Assembly on broader basis than that contemplated by the Giraud-de Gaulle agreement.

RONALD STUART KAIN.

FRANKLIN INSTITUTE. The Franklin Institute of the State of Pennsylvania for the Promotion of the Mechanic Arts, founded in 1824, is devoted to the increase of useful knowledge, to the encouragement of invention and discovery, and to the education of the public in the achievements of science and industry. Its very title has always indicated a desire

to do honor to Benjamin Franklin.

The Committee on Science and Arts, formed of 66 members of the Institute, reviews in great detail many of the advances of science and technology. It recommends to the Board of Managers those persons deserving the annual awards of the Institute, which are formally presented at Medal Day Exercises in the spring. A Franklin Medal, highest award of the Institute, was presented in 1943 to George Washington Pierce, who formerly held the chairs of Rumford professor of physics and Gordon McKay professor of communication engineering at Harvard University, in recognition of his outstanding inventions, his theoretical and experimental contributions in the field of electric communication, and his inspiring influence as a great teacher; and to Harold Clayton Urey, Professor of Chemistry and Executive Officer, Department of Chemistry, Columbia University, in recognition of his discovery of an isotope of Hydrogen of Mass 2, which has resulted in the opening of new fields of knowledge in three of the physical sciences.

The Franklin Institute includes in its activity publication of *The Journal of the Franklin Institute*, established January, 1826, and lectures presented about 20 times a year by distinguished persons in science and industry. From the laboratories of the Bartol Research Foundation and the Biochemical Research Foundation, additions are con-stantly being made to scientific knowledge. The two laboratories, the machine shops, and the staff of the Institute are all working to the fullest extent in the war program. The Institute also operates a seismograph and promotes scientific expeditions. The seismograph and observatory, with Franklin Hall and the Fels Planetarium, together with its 4,000 active exhibits constitute the Institute's museum. The library now numbers 123,000 volumes and 40,000 pamphlets, devoted entirely to works on applied science and technology, and is particularly noted for the collection of patent literature. To make Franklin better known and emulated, the National Franklin Committee was formed in 1941. All information is distributed free.

President, reelected in 1942, Charles S. Redding; Secretary and Director, Henry Butler Allen. The Institute is located in a new building on Benjamin Franklin Parkway, Philadelphia, Pa.

FREEDOM OF RELIGION, SPEECH, etc. See Law under Decisions Concerning Personal Liberties; NEWS-PAPERS; EIRE, HONDURAS, and U.S.S.R. under History; also, ART under Painting.

FREEDOM OF THE AIR. See AERONAUTICS under Postwar Air Policy.

FREEMASONRY. Within the past year, Freemasonry in all the English-speaking nations has worked successfully to adjust its activities to the realities of war. Save in Sweden and Switzerland alone, our Brethren on all the Continent of Europe have been scattered, their Temples profaned, their property pillaged, yet they are still keeping the faith. Those who have gone into exile have almost invariably made haste to establish new Masonic connections, whether in associations and even in Lodges of their own or as guests in existing Lodges.

their own or as guests in existing Lodges.

Once again the United Grand Lodge of England had to mourn the passing away of an illustrious Grand Master. In January of this year the Duke of Kent was killed in an airplane accident in the service of his country. On June 1 the Earl of Harewood was installed as Grand Master by King George. The ceremony was most impressive, with many notables present from neighboring Grand

Lodges.

Service and Sacrifice are indeed watchwords of Masonry in the British Isles. The Grand Lodge of Ireland, for example, reports that its two Lodges on the Island of Malta have sent their usual monetary contribution to funds maintained by the Grand

Lodge.

Notwithstanding all the other drains of wartime, the Irish Brethren are able to report not only that they are keeping up their usual philanthropic work but are able in some respects to increase their donations. Similar accounts come from Scotland, where the Crand Lodge reports its chief philan-

thropic funds in satisfactory condition.

The American Craft in Time of War. Among the forty-nine Grand Lodges of the United States readjustment of normal peacetime activities to meet the exigencies of war has continued to dominate the thinking of the Craft. Pecuniary gifts have poured out in unprecedented volume. Here and there Brethren have debated the forms and uses to which gifts should be put, but there has been no argument about the necessity for giving. In general it may be said that American Masonic leadership has been animated by a desire to serve, rather than to direct; to support existing public agencies rather than to supplant them.

The war has been responsible for dislocations and novel problems of great complexity. It seems quite possible, for example, that in many States after the war the entire present system of administering philanthropic enterprises will have undergone profound changes. For one thing, governments, State and Federal, are taking over more and more from private hands the management of relief and care of the helpless. Already the effect

of this has been felt by many Grand Lodges. The Grand Lodge of Tennessee, for illustration, has sold its Masonic Home property to the State, providing for the residents in other property obtained on lease and endeavoring to take charge of orphans and elderly beneficiaries in their respective localities. The Jurisdiction of Rhode Island is also in process of revising its philanthropic set-up.

The national falling off in membership which began some ten years ago is being steadily, if slowly, arrested. Eighteen Grand Lodges actually report gains for the year, though in some instances these have been small. Ten of these are in the South and Southwest, six in the Midwest, two in the West. In 1943 there were 15,231 Lodges in the United States, having a combined membership

of 2,481,440.

The annual conferences of the Grand Masters, Grand Secretaries, and the Masonic Service Association at Washington in February were attended by representatives of all forty-nine American Grand Jurisdictions, including Grand Masters from all but three of them. The shadow of war fell over most of these deliberations. There were talks about Freemasonry's obligation to those who are defending the principles of democracy and Freemasonry; about the status of chartered American Lodges in regions overrun or menaced by the enemy; about experiences gained in the last war; about the purchase of war bonds, and about contributions to the comfort of Masons under arms.

The Masonic Service Association had a busy and eventful year. Although its membership includes a majority of the American Grand Jurisdictions, others have preferred to give independent support to various phases of its work and still others have worked separately along their own preferred lines.

The Far East. Masonry in the Far East, overwhelmed by the disaster of Japanese militarism, has found encouragement in the news from California that Grand Master Wood has granted a dispensation to twenty-five Brethren in Chungking, China, to form a Lodge to be known as Fortitude Lodge, U.D. The suppression of Masonry in the Philippines brought complexities for Masons from the Archipelago who are residing in the various American Grand Jurisdictions. Not least of these is the difficulty of maintaining themselves in good standing. California has eight Lodges in the Hawaiian Islands which continue to meet, even though they must take counsel with a Military Governor as to time and place of meeting. One of the Hawaiian Lodges had sent over a contribution for war relief. Right in the battle zone, Pearl Harbor Lodge has participated in every event, both public civilian and Lodge work.

In Australia and New Zealand Masonry is evidently meeting wartime conditions with sturdy resolution. Not only are they taking care of their own, but they are making special effort to show Masonic hospitality to visitors in the armed forces of the United States. In Western Australia an effort continues to unite the Lodges working under jurisdiction of the Grand Lodge of Scotland with those working under the Grand Lodge of Western Australia. The Board of General Purposes of the Grand Lodge of Tasmania has approved plans for the erection of a new Temple at Waratah and has prepared a traveling certificate for Brethren on active military service.

Masonry North of the Border. Reports from Grand Lodges on both sides of the border between the United States and Canada continue to emphasize friendship and reciprocal esteem. It is exceptional when any Jurisdiction on either side holds an Annual Communication which is not attended by distinguished guests from the other side. Notwith-standing the terrific strains which the war has imposed upon Canada, the Lodges and Grand Lodges of that country have carried on their Masonic work

with undiminished vigor.

Mexico. Because of irregular Lodges and Grand Lodges in Mexico, the Masonic picture in that country is still a little blurred, but there is reason to believe that those which have obtained recognition as regular by the Grand Lodges of the United States are continuing to prosper. Among these is the York Grand Lodge of Mexico, which is recognized by all but two Jurisdictions in the United States. This body at its Annual Communication in April voted to extend fraternal recognition to "members in good standing of the respective constituent Lodges under the Jurisdiction of the regular State Grand Lodges of the Republic of Mexico." See Algeria, France, and Morocco.

FRENCH EQUATORIAL AFRICA. A French colonial territory consisting of the four colonies: Chad (461,-202 sq. mi.; capital, Fort Lamy), Gabon (93,218 sq. mi.; capital, Libreville), Middle Congo (166,-069 sq. mi.; capital, Brazzaville), and Ubangi-Shari (238,767 sq. mi.; capital, Bangui). Total area, 959,256 sq. mi.; total population (Jan. 1, 1938 estimate), 3,500,000. Capital, Brazzaville.

Production and Trade. The principal agricultural products are palm kernels and oil, coffee, cacao, cottonseed (41,400 metric tons in 1940–41), cotton (18,000 metric tons, 1940–41), and rubber (about 5,000 tons, 1942). Tropical forests of 300,-000 square miles in area contain many trees of industrial value. In the Chad colony large numbers of cattle, sheep, horses, donkeys, camels, and ostriches are raised. Ivory is an important export. Copper, zinc, lead, gold, and diamonds are the chief minerals. Trade, values in old U.S. gold dollars (1938): imports \$5,000,000; exports \$4,500,-

Communications. The chief ports are Pointe-Noire, Port Gentil, and Libreville. A railway, 318 miles long, connects Brazzaville with Pointe-Noire. Roads (1940): 14,713 miles. Since 1940 two new highways have been built across French Equatorial Africa in order to supplement sea lanes to the Allied armies in the Middle East. The northerly route, which has a branch from Takoradi on the Gold Coast, is from Duala through Fort Lamy near Lake Chad to Khartoum; the southerly route is from Duala through the colony of Ubangi-Shari to Juba in southern Anglo-Egyptian Sudan. A new north-south highway from Libreville to Brazzaville to Pointe-Noire has been completed and another connecting Bangui with Fort Lamy was completed late in 1942

Government. Budget estimates (1940): revenue and expenditure balanced at 224,629,000 francs (franc averaged \$0.0208, 1940). French Equatorial Africa, by a decree of June 30, 1934, was constituted a single administrative unit under the control of a governor general, assisted by an administrative council. During 1940 French Equatorial Africa seceded from the Vichy Government in France and joined the Fighting French movement headed by Gen. Charles de Gaulle. Félix Eboué, French Negro governor of Chad Territory, who led this secession movement, was appointed Governor General of all French Equatorial Africa early in 1941.

FRENCH GUIANA. A French territory in northern South America, comprising the colony of French Guiana (7,720 sq. mi.; pop. 31,000) and the hinterland territory of Inini (27,020 sq. mi.; pop. 6,000). The penal settlement had a population of 5,628 men. Chief towns: Cayenne (capital), 13,936 inhabitants; Mana; Oyapock, St. Laurent; Sinnamary. Rice, maize, manioc, cacao, coffee, bananas, and sugar cane are the chief agricultural crops. There are large forests rich in various kinds of timber. Gold mining is the chief industry (1,170 kilograms exported in 1939). Silver, copper, iron, lead, mercury, and phosphates are found. Foreign Trade (1940): imports 64,154,188 francs; exports 44,502,181 francs (franc averaged \$0.0208, 1940). Figures of finance since 1937 are not available. Shipping (1940): 378 vessels entered and cleared. Administration is controlled by a governor, assisted by a privy council of five members. There is a council general of eight elected members elected by French citizens living in the colony.

History. The French authorities in French Guiana, who had adhered to Marshal Pétain's Government at Vichy upon the collapse of the Third Republic in 1940, were ousted on Mar. 18, 1943, by a pro-Allied committee having the support of both the French military forces and the bulk of the population in the colony. The pro-Vichy Governor, René Véber, fled to Brazil after a popular demonstration in Cayenne, turning over his powers to the members of the committee—Colonel Vanegue, the military commander; M. Collat, the Colonial Secretary; and

M. Sophie, Mayor of Cayenne.

The repudiation of the authority of Admiral Robert, Vichy pro-consul in charge of the French West Indies and French Guiana, inaugurated a struggle between adherents of Gen. Henri Honoré Giraud and Gen. Charles de Gaulle for control of the colony. General de Gaulle appointed M. Collat, the Colonial Secretary, as Acting Governor pending the arrival of Maurice Bertaut, then in Brazzaville, French Equatorial Africa, whom de Gaulle designated as permanent Governor. General Giraud sent Col. Albert le Bel post haste from Washington to serve as Acting Governor pending the arrival of his permanent appointee, Jean Rapenne.

The members of the committee and the inhabitants were divided in support of these rival claimants, with the military commander supporting Giraud. The United States and Brazil sent military missions to Cayenne at the end of March to observe conditions and prevent clashes between the rival factions. With U.S. support, the Giraudist appointees remained in control until the union of the de Gaullist and Giraudist factions in the French Committee of National Liberation at Algiers on June 3. On July 7 the Committee appointed Brig. Gen. Henri-Paul Jacomy as commander of French military forces in French Guiana and the French Charles and Charl West Indies. It also confirmed M. Rapenne's appointment as Governor,

Meanwhile the anti-democratic Vichy decrees in effect in French Guiana had been revoked, political prisoners released, and pro-Vichy officials purged from the lower ranks of the administration. The United Nations blockade aimed at the Vichy regime was ended, and trade resumed with the United States, Brazil, and British and Dutch colonies in the West Indies. See France and Martinique under History.

FRENCH INDIA. The five French colonies in India-Chandernagor, Karikal, Mahé, Pondichéry, and Yanaon. Area, 196 square miles. Population (1941), 323,295. Capital, Pondichéry, 53,101 inhabitants. Education (1941): 62 primary schools and 5 colleges, and 14,324 students.

Production and Trade. The chief crops are rice, manioc, and groundnuts. Livestock (1941): 29,516 sheep, 19,310 cattle, and 19,962 goats. There are cotton and jute mills at Pondichéry and Chandernagor. Trade, at the ports of Pondichéry and Karikal (1940): imports 52,040,000 francs; exports 72,853,000 francs (franc equaled \$0.0208, 1940). Shipping (1940): 255 ships entered and cleared. There were 43 miles of railway open to

Government. Budget (1942): revenue and expenditure balanced at 3,274,860 francs. A governor heads the government of the colony. There is an elective general council.

FRENCH INDO-CHINA. A French dependency in southeastern Asia comprising the divisions shown in the accompanying table. It was occupied by Japanese forces in 1940 and 1941.

| Division   | Sq. mi.   | Pop. (1936)  | Capital  |
|--|---|--|--|
| Annam a. Cambodia a. Cochin China b. Kwangchowan c. Laos a. Tonkin (Tongking) a. | 57,143<br>69,884 ¢<br>25,096<br>309<br>89,189 ¢<br>44,787 | 5,656,000<br>3,046,000<br>4,616,000<br>230,000<br>1,012,000<br>8,700,000 | Hué Pnom-Penh Saigon Fort Bayard Vientiane Hanoi |
| French Indo-China  | 286 408 6   | 23 260 000   | Hanoi d  |

\*Protectorate. \*\*Colony. \*\*Also known as Kwangchow; leased from China for 99 years in 1898 (territory increased in 1899) and placed under the authority of the Governor General of French Indo-China. \*\*The capital city is Hanoi, but during certain seasons of the year, when climatic conditions are oppressive, the government offices move to Saigon. \*\*Figures include 26,664 sq. mi. of territory in Cambodia and Laos ceded to Thailand under the terms of a border agreement signed on July 30, 1942, which carried out the territorial provisions of the treaty signed between the Pétain regime of France and Thailand at Tokyo on May 9, 1941.

The total estimated population on Jan. 1, 1940, was 23,950,000. Chief towns: Hanoi, the capital, 134,849 inhabitants in 1940; Binh-Dinh, 147,199 (1936); Cholon, 145,254 (1936); Haiphong, 122,-000 (1936); Saigon, 110,577 (1936); Pnom-Penh, 102,678 (1936); Hué, 33,222 (1936); Fort Bayard, 12,000 (1936).

Education. See 1943 YEAR BOOK, p. 267.

Production. The principal agricultural crop is rice, but recent figures of production are not available. Rubber produced during 1941 was estimated at 67,200 metric tons. Maize, pepper, spices, tea, kapok, groundnuts, and copra are other agricultural products. Minerals produced included anthracite (2,456,000 metric tons in 1940), gold, chromite, manganese, tungsten, antimony, tin, zinc, and iron. Trade (1939): imports 2,382, 262,000 francs (cotton and silk tissues, metal goods, and motor vehicles were the chief items); exports 3,494,724,000 francs (rice and rubber were the main items). The franc was worth \$0.0251 in 1939; one piaster equals 10 French francs.

Communications. In 1940 there were 22,658 miles of roads, 2,093 miles of railways, 9,687 miles of telegraph lines, 8,932 miles of telephone lines, and a radio-telephone service from Saigon to Europe. A highway between Paksane and Thakhek, 73 miles in length, along the Mekong River, was completed in 1943.

Finance. The general budget for 1941 was balanced at 1,290,147,500 francs and the extraordinary budget at 189,337,800 francs. The public debt

on Jan. 1, 1941, was 2,515,894,110 francs.

Government. The government for the whole of French Indo-China was administered by a governor general assisted by a secretary general, a government council, and a grand council for economic affairs. Cochin China, a direct French colony, was headed by a governor aided by a colonial council.

Each of the four protectorates (Annam, Cambodia, Laos, and Tonkin) was headed by a resident superior assisted by a protectorate council and a council of economic affairs. Governor General, Adm. Jean Decoux (appointed July 20, 1940). After the Japanese occupation, the French administration served as a puppet government, carrying out di-rections of the ranking Japanese military commander and diplomatic representative. For 1943 developments, see below.

History. According to neutral travelers, who left French Indo-China early in October, 1943, the Japanese were adhering more strictly than in 1942 to the Vichy-Tokyo pact of July 29, 1941, which ratified the previous Japanese occupation of key points within the dependency (see 1942 YEAR BOOK, p. 224, for provisions of the pact). The French administration of Governor General Decoux was said to control all essential services. Decoux, it was reported, had presented an increasingly strong front to the Japanese, who displayed a growing desire for French cooperation as their military outlook worsened.

Japanese efforts to increase rice shipments from French Indo-China by 400,000 tons annually were resisted. The Governor General was said to control an army of French soldiers, Foreign Legionnaires, and native troops which was stationed along the Tonkin-Chinese border. American planes based in China made frequent raids on Japanese-controlled bases and industrial plants in the northern part of the dependency, while American submarines preyed on Japanese shipping off the French Indo-China coast.

Representatives of the French Committee of National Liberation at Chungking, China, on December 10 promised that French Indo-China would be granted a "more liberal" political status and control of its own customs after the war. This declaration followed growing criticism of the prewar French administration in Indo-China among Chinese official and unofficial circles, coupled with suggestions for the termination of French rule. See Japan under History.

## FRENCH IVORY COAST. See French West Africa.

FRENCH LITERATURE. Since the occupation of the whole of France (Nov. 11, 1942) and the closing of frontiers, all reliable news from the isolated mother country has had to be smuggled in; items were few, and they were unpleasant. The periodical *Université libre* of Nov. 24, 1942, listed a number of names of "intellectuels"—professors or writers—who were revoked or shot; among the second Jacques Decoux, the founder of the Lettres Françaises. Even since November, 1942, a rather strong group of French "intellectuels," has obstinately group of French "intellectuels," has obstinately clung to adherence to the Vichy regime—for example, Roche, the director of the Odéon Theater since 1941, or the playwright Brasillach who was released from an "oflag" to allow him to become a Nazi propagandist in France. For the second year, a delegation of some French "collaborationists" went to the so-called "International congress of literature" at Weimar, among them such inveterate "collaborationists" as Drieu de la Rochelle, Alphonse de Chateaubriant André Thérive. Giong Alphonse de Chateaubriant, André Thérive; Giono, however refused to join, and Pierre Benoit, the Academician, declined to hear the Delegation. Men of similar dispositions signed a so-called "Manifeste des intellectuels" to protest the invasion of Africa by Americans: men like Jacques Boulenger, Jacques Chardonne, Ramon Fernandez, and the two Academicians, Abel Hermant and Abel Bonnard. A new "Otto list" of French authors whose writ-

ings are forbidden by the Nazis (see Year Book, 1941) was published, to which two names were later added, Jules Verne and De Kerillis, the excellent weekly contributor to the New York Pour la Victoire. Two of the most important dailies ceased to appear, Le Temps and Le Figaro, the first being forced to discontinue, the second refusing to accept new restrictions. In this connection see a very relevant article "Bilan d'une trahison" reproduced from a clandestine paper and brought to light by Pour la Victoire (July 24), telling how Abetz, having failed to get a Nazi hold on the Revue des Deux Mondes, succeeded with the Nouvelle Revue Française which had been for years the organ of the progressive intelligentsia of France; it came to pass with the help of the arch-collaborationist Drieu de la Rochelle.

The happier counterpart to these outrages exists to a certain extent; but it has to be looked for outside of France, in America first of all. The torch was kept burning by such commemorations as the centenary of Jefferson's death in a ceremony at the "Ecole libre des Hautes Études" in New York, or by the Manifesto by 43 eminent French Catholic refugees, Devant la crise mondiale (published by the Ed. Maison Fr., N.Y., in the last part of 1942). Besides the École libre des Hautes Études, the Lycée Français kept on prospering, as did also such French schools as Middlebury, Western Reserve, Mills College, and the Pontigny-Holyoke gatherings. The publication of books in French on this side of the Atlantic continued to grow in importance, especially after the complete stop of importations from France; the catalogues of firms like Brentano, Maison Française, Didier in New York, or Ed. de l'Arbre, Fides, Pony, Valiquette, Variétés, in Canada, are every day added to. Schiffrin, until recently editor of the collection "La Pléiade" in Paris, joined the staff of Brentano's, while Max Fisher, the alert head of the Maison Flammarion, Rue de l'Odéon, left Paris to found a great publishing firm in Rio de Janeiro, with Pony of Montreal as his Canadian associate. In Argentina, the output of French books continued important under the guidance of the vigorous quarterly Lettres Françaises (R. Caillois, editor).

The situation concerning the editing and pub-

The situation concerning the editing and publishing business had become somewhat confused, with the publishers trying to cater to very different classes of readers; some books were merely reprints from the works of popular writers no longer accessible in America: authors like Giraudoux, Valéry, Mme. Colette, Maurice Genevoix, Eve Curie, A. Carrel, Rimbaud. In a good many cases one could discern (often in the case of Canadian firms) a desire to favor publications with a Catholic trend: Bainville, Pesquidoux, J. Rivière (A la trace de Dieu), Péguy, Daniel Rops, Bordeaux, Fr. Jammes, or even René Schwob's Cinq mystères en forme de rétable. The bulk of publications, however, were those dealing with timely problems,

which will be mentioned below.

A surprise development was that of French papers and periodicals published in the Western Hemisphere, some already a few years old, but a number of them very recent: weeklies like Pour la Victoire, France-Amérique (replacing Amérique), in New York; Le Jour, in Montreal; or monthlies, semimonthlies, and quarterlies, like Amérique française, La nouvelle Relève, Hémisphère, Lettres françaises, Renaissance, Revue de la Pensée française, Le messager de New York, French Forum, Revue française d'Amérique, Voici la France de ce mois, Le monde libre. Add to this the young Fontaine, published in Algiers, which sprang up almost im-

mediately after the invasion of Africa, and La France nouvelle just founded in Buenos Aires.

France notative just formed in beliefs Afres.

For more detailed information the reader can be referred to valuable articles, and rapid bibliographies: G. Lountz (former Manager of "Office des Editions françaises" in Paris) "French Books after the Armistice" (Books Abroad, Winter 1943); Alb. Gaudin, "Témoignages" (French Review, January and February), publications related to the France of the war; and a list of publications along the same lines in the same Review (May 1943).

It is very difficult to draw a line of demarcation between what can be considered literature and what ought to be classified as merely propaganda, but surely some of the second group also belong to the first; the following amongst others: Saint-Exupéry, Lettre à un ôtage—the addressee is said to be Léon Werth, a friend of the author; Henri Laugier, Combat de l'exil (Professor Laugier left Canada where he was a refugee to accept, late in the year, the rectorship of the University of Al-giers); Raoul Aglion, L'Epopée de la France combattante; Philippe Barrès, Sauvons nos prisonnier; Paul Vignaux (pseud. for Jacques Rochelle), Traditionalisme et Syndicalisme, and France, prends garde de perdre ton âme; the first one expresses the opinion of liberal-minded Catholics who are also socialistic minded, and suggests enrollment of the working classes under the banner of the pope, thus forming a party facing the communistic socialism; G. Cohen, Lettres aux Américains. The satire of the Vichy government by the well known Pertinax (pseud. for André Géraud), under the title Les Fossoyeurs (The Grave Diggers) may be considered the most important contribution to this class of literature. Others are Daniel Halévy, Trois épreuves, 1814, 1871, 1940; J. Benda, La grande épreuve des démocraties; Yves Simon, La crise de la République; Léon Blum, L'Histoire jugera; the severe indictment of Pétain, in Francis Martel's Pétain, De Verdun à Vichy, by contrast with Pétain, Le plus hours textes (with by Ad Fides Mon Les plus beaux textes (publ. by éd. Fides, Montreal), and Pétain, by Général Chadebec de Lavelade (éd. de l'Arbre, Montréal); René Guenette, La cité nouvelle (Valiquette, Montréal); Pierre Lanux, Têtes de pont, etc.

Some of the arresting books relating personal experiences of soldiers and prisoners published in 1943 were: Jean Malaquais (author of Les Javanais—see Yean Book, 1940) Journal de guerre, which will remind many of Barbusse's Le Feu (1916)—ultra-realistic, egocentric, and very cynical in the first part, but more humane when the author has measured the inhumanity of Nazism; Constantin Joffe, Les Enterrés vivants du Stalag XVII A, highly praised by Louis Bromfield; Pierre Mendès-France (Finance minister of the Comité de Libération in Algiers) Liberté, Liberté chérie and Jean Hélion, Ils ne m'auront pas (also publ. in English), both from the pens of escaped prisoners; Pauline Corday, Un an à Paris sous les Boches. Here belongs one of the most telling documents of the war, a diary written by a fanatic Nazi aviator who was shot down over London, betraying an amazingly cynical contempt for the "inferior races"; it was translated in French and published by the Maison Française, N.Y., under the title J'étais un aviateur nazi, Journal au jour le jour.

Poetry. A place of honor belongs here to one of the outstanding, if not the most outstanding, poets of this generation, Jules Supervielle, whose collection Poemes de la France malheureuse, published in Buenos Aires (1942) was late in reaching the United States. The talented Canadian poet, Jean Charbonneau, published a sixth volume of verses on various topics under the general title Tel qu'en sa solitude. In Canada also unpublished "Poems" by Jean Wahl, came out in the September issue of La nouvelle Relève, together with a paper by Robert Elie, "Voies nouvelles de la poésie." Another discussion of modern poetry, by Edmond Jaloux, was to be found in the new French periodical in Algeria, Fontaine. In the same review were three important fragments of Louis Aragon's Cantique à Elsa, the complete collection having been published under the title Les yeux d'Elsa in French Switzerland. The alert Argentine review Lettres Françaises published in February an issue devoted almost exclusively to poetry. A chapter on "Paul Valéry" forms part of the volume The Heritage of Symbolism, by C. W. Bowra (London).

Theater. Although less can be said than ever before of the French stage, it has been possible to gather from indirect sources that the Nazis were still trying hard to keep going that form of distraction from the terrible war situation. Jean-Louis Vaudoyer, a confirmed collaborationist, succeeded the late Bourdet at the helm of the Comédie Française, and he did not conceal his willingness to bow before the wishes of the masters of the hour; Schiller's Kabale und Liebe was one of the plays produced. It became known that protests and even riots occurred and that some of the best artists were forced out. The rumor was that Dullin had taken over the Théâtre de la Cité, that Jouvet had not returned from South America after having refused the direction of the Comédie, that Baty had left the Théâtre Montparnasse. Suzanne Fournier (see Pour la Victoire, October 23) gave the names of eight women now in charge of well known play-houses. Gaby Morlay revived L'Insoumise, by Frondaie, at the Théâtre de Paris.

Plays had to avoid, as in preceding years, anything that might be construed as patriotic and the old classics were frequently resorted to: Moliére, Racine, Beaumarchais. Of new plays which can be mentioned, one was hailed in Paris as a notable success, an Euridice by Arnouilh. However, even the controlled Nazi press seemed to agree that La Tenue de Soirée est de rigueur was far from a success; it is by an unknown author Paul-Alain, the message being that good comradeship may best be enjoyed in unconventional surroundings. A rehearsal was advertised of a new play by Giraudoux, Sodome et Gomorrhe; but in the meanwhile Giraudoux fled to Switzerland. A praiseworthy attempt at a historico-patriotic play in verse was made in Canada by Henri Deighm. La France viture

Canada, by Henri Deiglun, La France vivra.

Novel and Short Story. If fiction was not as abundant as in normal times, it can be said that both in quality and in quantity it surpassed expectations. This was due in part to the arrangements which publishers in the United States, Canada, and South America were able to make to insure printing of prose written by authors well known in France. Here are a few stories in which the war forms a background; they are not always the best. The outstanding one came out in English (published by Life, Oct. 11, 1943) under the title Silence of the Sea; it had been published in French in a clandestine periodical Editions de Minuit with Vercors as the name of the author: a German officer, garrisoned in a village in France, professes a profound admiration for French culture and life and believes that both his countrymen and the French will one day meet on common ground, but he finds out on a visit to Nazi chiefs in Paris that his views are a subject of mockery by those who try to strangle France forever. Vladimir Pozner's Les gens du pays describes the life of a small

locality in France under the heel of the Gestapo. Ch. Megret, in Jacques, analyzes the case of a soldier who by a cowardly act is responsible for the life of his fellows-in-arms and finds himself in the grip of remorse. Mme. Claude Eylan, Combat avec l'inconnue takes the reader into a milieu of socialites indulging in intrigues while the war is going on. The easy pen of Robert Goffin produced La colombe de la Gestapo, while the even more inexhaustible M. Dekobra continues his series of sensational stories: Lune de miel à Shangaï, Le roman d'un lâche, Le médecin des fous.

The following novels took little account, or none at all, of the war. The best seller, both in French and in English, was the not very long fairy story of delicate humor and of subtle although not very severe satire, Le petit Prince by Antoine de Saint-Exupéry. G. Duhamel printed from his series of the Pasquier La nuit de la Saint-Jean, and Romain Rolland offered the 22nd volume of Les hommes de bonne volonté: Les travaux et les joies. Fr. Mauriac in Le mal de la femme studied the case of the woman who married a younger man, Guy Mazeline published in Geneva and simultaneously in Montreal, Pied d'Alouette, the nickname given to a kindhearted old writer, the central figure in a story which covers three generations. Mme. Colette wrote Julie de Carneilhan. Pétion Savain, La case de Camballa (in Oeuvres nouvelles III) told a fine story of two colored natives in Haiti. A successful story was La jambe noire, by Henri Chéon, an old medieval legend of Christian inspiration, similar in theme to the American best seller The Robe.

Here a group of Canadian novels: Rex Desmarchais's La Chesnaie told the story of a sort of ambitious Canadian Hitler, descendant of the patriots of 1837. More in the present spirit of the country was Robert Charbonneau, Ils possèdent la terre. So was Adolphe Nantel's La terre, roman paysan, and Jacques Sauriol's Le désert des lacs. Another theme is found in Maurice Kerduff, Joliff et Magadur, roman de mer. Isabelle Tonacelli in Jeunes femmes attempts a psychology in the manner of the recent series of Montherlant, Les jeunes filles.

Some outstanding collections of short stories: André Maurois, Toujours de l'inattendu; Jules Supervielle, Le petit bois—witty sketches on themes suggested by ancient legends; two collections of sea stories: Roger Vercel, Clandestine, and Jean Merrien, Marines. Jules Romains had a 'Conte symbolique' in Volume III of Oeuvres Nouvelles (N.Y.).

Varia. In the class of Memoirs the first place belonged to Fr. Carco, Nostalgie de Paris; Léon Guerdan, Je les ai tous connus; and Gust. Cohen, Ceux que j'ai connus. Then, the important souvenirs by Fr. Mauriac (Les jeux, Bordeaux, Mes plus lointains souvenirs, Commencements d'une vie, Mes premières années à Paris), and by André Maurois, Années d'apprentissage, and Années de travail. Paul Claudel published in Geneva a little volume Présence et prophétie. In the domain of history: Brentano, in New York, published Typhosa Bates-Batcheller's L'Ame d'une reine [Louise-Marie de Gonzague, who became queen of Poland when she married Vladimir VI, in the XVII century]; André Maurois, Histoire des États-Unis; Robert Goffin, De Pierre Minuit aux Roosevelt, L'épopée belge aux États-Unis; Jean Bruchésy, De Villa-Marie à Montréal (the story of Jacques Cartier's city); Régina Hubert-Robert, La Louisiane française (Ed. Maison Fr. N.Y.).

History of Literature and Criticism. Wallace Fowlie, Grandeur de la pensée française (Pascal, Péguy, Claudel, Baudelaire, Scève . . .); Gonzague de Reynold, Le XVII<sup>me</sup> français (Arbre, Montreal); Roger Picard, Les salons littéraires de la société française au XVII<sup>me</sup> et au XVIII<sup>me</sup> siècles; Émile Cailliet, La tradition littéraire des Idéologues; E. P. Shaw, Joseph Cazotte, 1719–1792; Roger Picard, Le roman Social; Matthew Josephson, Victor Hugo, a Realistic Biography of a Great Romantic (N.Y.); Aug. Viatte, V. Hugo et les Illuminés de son temps (Canadian version of a French book); Marie Gilman, Baudelaire the Critic (Columbia Press); Gaston Gilles, Jules Vallès, 1822–1885; ses révoltes, sa maîtrise, son prestige, (2 vol.); Léon Daudet, Quand vivait mon père; Georges Reyer, Un coeur pur, Marguerite Audoux about the author of Marie-Claire, a best seller of 1910; Pierre Brodin, Maîtres et témoins de l'Entre-deux-guerres, a continuation of the 1942 volume, treating Péguy, Bernanos, Maurois, Morand, etc. Two important volumes of essays were J. Giraudoux Littérature (Racine, Laclos, Nerval, etc.) and A. Rousseau, Le monde classique (Homère, Corneille, Chateaubriand, etc.).

Personalia. The death, for lack of proper food, has been announced of Louis Gillet, of the French Academy, early in July. Together with this news, came a belated report that the Fr. Academy had awarded, several months before, a prize to Pierre Lecomte du Nouÿ, for a very successful work L'Avenir de l'esprit—a counterpart to Renan's L'Avenir de la Science, published half a century earlia. Jean de la Varende was elected to replace L. Daudet as a member of the Académie Goncourt. The founder of the Théâtre libre, and later director of the Odéon for eight years, Antoine, died in Brest at 85. Contradictory reports were circulated about Romain Rolland's fate, and the same was true of Herriot.

See Necrology under Schinz, Albert.
Albert Schinz.

FRENCH OCEANIA. The French possessions in the eastern Pacific, comprising several groups of islands. The principal groups are: Society, Marquesas, Tuamotu, Leeward (Hes sous le Vent), Gambier, Austral, and Rapa islands. Clipperton, an island 670 miles southwest of Mexico has been included in French Oceania. Tahiti (600 sq. mi.; pop. 19,029 in 1936), of the Society group, is the main island. Total area, 1,520 square miles. Total population (Jan. 1, 1938), 45,000. Capital: Papeete (on Tahiti), 8,456 inhabitants, Copra, vanilla beans, phosphate (160,680 tons exported in 1939), and mother-of-pearl are the chief products. Trade (1939): imports 80,482,000 francs; exports 63,536,000 francs (franc averaged \$0.0251 for 1939). Budget (1939): 27,560,000 francs. The Government is under the control of a governor, assisted by a private council and an assembly of financial and economic delegations. Governor, Colonel Orselli.

FRENCH SOMALILAND. A French colony in Africa, at the southern entrance to the Red Sea. Area, 8,492 square miles; population (1936 census), 44,240, including 27,380 Somalis, 4,200 Arabs, 12,000 Danakils. Chief towns: Djibouti (Jibuti), the capital, 20,000 inhabitants in 1939; Obock, Tajura, Gueherne, Galamo, Gobad.

Production and Trade. The chief occupations of the people were fishing, salt mining (85,000 tons, 1937), and the transit of goods to and from the interior. Trade (1938): imports 147,700,000 francs (the chief imports were textiles, catle, coal, and sugar); exports 85,300,000 francs (the main exports were coffee, hides, and salt). The 1938 transit

trade was valued at 521,563,195 francs (franc averaged \$0.0288 for 1938; \$0.0251 for 1939). Shipping entered at Djibouti in 1938 totaled 2,823,-096 tons. There is a railway from Djibouti to Addis Ababa. Ethiopia. 496 miles in length

Ababa, Ethiopia, 496 miles in length.

Government. Local budget (1939): 26,000,000 francs. The government is administered by a governor, assisted by an administrative council. On Dec. 29, 1942, it repudiated the Vichy Government in France and adhered to the Fighting French National Committee. Governor, André Bayardelle (ap-

pointed Dec. 29, 1942).

History. Measures of monetary reform in an endeavor to prevent serious inflation were established in French Somaliland on Feb. 18, 1943. The value of the franc was set at 176.625 francs to the £ sterling, the same rate as for French Cameroun, French Equatorial Africa, New Caledonia, etc. Based on the current exchange of the £ sterling, the franc was equal to \$0.0288.

FRENCH SUDAN. See French West Africa. FRENCH TOGO. See Togo, French.

FRENCH WEST AFRICA. A French colonial federation made up of the colonies shown in the accompanying table.

| Colony             | Sq. mi.   | Pop. (1937)  | Capital    |
|--------------------|-----------|--------------|------------|
| Dahomey            | 43,232    | 1,289,128    | Porto-Novo |
| Dakar a            | 60        | 126,929      | Dakar      |
| French Guinea      | 96,886    | 2,065,527    | Conakry    |
| French Sudan       | 590,966   | 3,635,073    | Bamako     |
| Ivory Coast        | 184.174   | 3,981,459    | Abidjan    |
| Mauritania         | 323,310   | 370,764      | Niamey     |
| Niger              | 499,410   | 1.809,576    |            |
| Senegal            | 77,730    | 1,666,374    | St. Louis  |
| French West Africa | 1.815.768 | 14.944.830 • | Dakar      |

<sup>a</sup> Including dependencies. <sup>b</sup> The lieutenant governor of Mauritania resides in St. Louis, Senegal. <sup>c</sup> The total population included 26,614 Europeans, of whom 18,188 were French.

Chief towns: Dakar (capital), 42,000 inhabitants; Kaolak, 89,981; St. Louis, 35,927; Porto-Novo, 27,483; Bamako, 32,761 (1940), Abidjan, 26,143; Thiès, 18,915; Bobo-Diulasso, 18,589; Ouagadougou, 16,595; Kayes, 15,894 (1940). Education (1937–38): 514 schools and 68,310 pupils.

Production and Trade. The principal agricultural products are groundnuts, maize, rice, palm kernels and oil, cottonseed, coffee, cotton, tobacco, sesamum, and cacao. Gold output for 1939 amounted to 129,889 troy oz. Trade (1938): imports 1,627,200,-000 francs (textiles, fuel oil, machinery, foodstuffs, and beverages were the chief items); exports 1,416,100,000 francs (groundnuts, cacao, gold, palm oil, timber, coffee, fruits, and gum were the important items). The franc averaged \$0.0288 for 1938; \$0.0251 for 1939.

Communications. In 1938 there were 2,453 route miles of railways, 21,457 miles of telegraph line, and 8,314 miles of telephone line. Highways totaled 33,565 miles in 1940.

Finance. The financial estimates for 1938 totaled 1,126,264,486 francs (made up of general budget 335,000,000 francs, local budgets 498,162,000 francs, supplementary budgets 293,102,486 francs). General budget for 1939 balanced at 349,000,000 francs.

Government. The whole federation of French West Africa was placed under the general control of a governor general, assisted by a council. All the colonies, including the circumscription of Dakar, are each administered by a governor subject to the Governor General at Dakar. Governor General Pierre Boisson, a Vichy appointee, switched his allegiance to Adm. François Darlan's provisional

regime at Algiers on Nov. 23, 1942. For developments in 1943 see below.

History. As described in the 1943 Year Book, the adhesion to the Giraud regime in Algiers of Governor General Pierre Boisson of French West Africa had ended Allied fears that the Germans would obtain control of Dakar. There they would have been in a position to attack the adjoining British and Fighting French colonies and Liberia, to disrupt the American and British air ferry service across the waist of Africa that ran through those territories, to attack Allied shipping in the South Atlantic, and to threaten an invasion of Brazil.

The anxieties aroused on the latter score were indicated by the joint declaration issued by President Roosevelt and President Vargas of Brazil at Natal on Jan. 29, 1943. They agreed that the coast of West Africa and Dakar should "never again under any circumstances be allowed to become" an invasion threat to the two Americas. However, statements by responsible observers early in 1943 confirmed Governor General Boisson's claim that he had never permitted German or Italian infiltration in Dakar or any other part of French West Africa. See "The Mystery of Dakar: An Enigma Resolved," Foreign Service Journal, April, 1943, by Thomas C. Wasson, U.S. Consul at Dakar from September, 1940, to February, 1942.

With the cooperation of the French authorities, I.S. payal and air activities at Dakar were greatly.

With the cooperation of the French authorities, U.S. naval and air activities at Dakar were greatly expanded during 1943, under the direction of Adm. William Glassford. On May 26 President Roosevelt appointed Glassford as his personal representative, with the rank of Minister, in French West Africa. The Admiral headed an American mission at Dakar charged with coordinating and supervising U.S. activities throughout that area. Pressure from General de Gaulle and his anti-Vichy supporters forced Boisson to resign as Governor General at the end of June. Pierre Cournarie, de Gaullist Governor General of French Cameroun, was appointed to succeed him by the French Committee of National Liberation at Algiers.

GAMBIA. A British colony and protectorate in West

GAMBIA. A British colony and protectorate in West Africa, occupying each bank of the Gambia River for a distance of 300 miles from the coast. Total area, 4,068 square miles; total population (1940 estimate), 205,000, as against (1931 census) 199,520. Capital, Bathurst, where resided most of the 14,370 inhabitants of the island of St. Mary. Education (December, 1941): 11 schools for primary and secondary education and 1,858 students.

Production and Trade. The chief products are groundnuts (35,000 tons estimated for 1942), palm kernels, hides, skins, and beeswax. Crops grown for local consumption included rice, maize, guinea corn, cassava, and cotton. Trade, including specie (1941): imports £563,303 (cotton piece goods, rice, non-edible oils, bags and sacks, kola nuts, to-bacco, and sugar); exports £290,087 (groundnuts and palm kernels). Shipping (1941): 281 vessels (445,244 tons) entered and cleared.

Government. Finance (1941): revenue £247,197; expenditure £208,453. Public debt (Dec. 31, 1941) £38,760. The area of the colony (Bathurst, Georgetown, and some adjacent land) is 69 square miles, but by an ordinance enacted in 1902, all Gambia except the island of St. Mary (4 sq. mi.) was placed under the protectorate system. In the protectorate there are 4 provinces each administered by a commissioner, responsible to the Governor who controls the whole country. There is an executive council of 4 members who assist the Governor, and a legislative council for the colony (consisting of 10 members over which the Governor presides) which has power to legislate for the protectorate. Governor and Commander in Chief, Hilary Blood (appointed Dec. 24, 1941).

GAMBIER ISLANDS. See French Oceania.
GARBAGE AND RUBBISH DISPOSAL. See Sanitation.
GARMENT INDUSTRY. See Fashion Events; Textiles. Compare Living Costs.

GAS INDUSTRY. Despite severe shortages of materials and manpower the year 1943 was one of marked achievement in the gas industry. While essential civilian services in the home and elsewhere were maintained, facilities were expanded to increase the output of gas fuel needed by industry to meet every requirement of the war emergency without curtailment of supply.

At the end of the year 19,450,000 customers were being served with gas; for the second successive year a record number in the history of the industry. Of this total, manufactured and mixed gas companies served 10,696,000 customers while 8,754,000 were served by natural gas companies. Revenues of the entire industry, both manufactured and natural, aggregated \$1,071,-850,000, an increase of 7.8 per cent over 1942. Of this, \$633,195,000 was grossed by natural gas companies, while the manufactured gas companies

grossed \$438,655,000. Total sales of natural gas for 1943 amounted to 1,983,687,000 M cu. ft., an increase of 12.5 per cent over 1942. The Statistical Department of the American Gas Association estimated the total production of natural gas in 1943 at 3,250,000,000 M cu. ft., an increase of 61,916,000 M cu. ft. over the preceding year.

PRELIMINARY ESTIMATES ON THE NATURAL GAS INDUSTRY FOR 1943

Statistical Department, American Gas Association.

The outstanding achievement of the year was the development and production by the Testing and Research Laboratories of the American Gas Association of two vital life-saving devices for the Army Air Forces. One is an automatic oxygen regulator which feeds oxygen to fliers in the amount required as altitude is gained. The other device is an oxygen therapeutic set used in the air transport of sick and wounded personnel.

Statistical Department, American Gas Association.

The study for postwar production of residential gas appliances and industrial equipment was accelerated during the year by some 400 per cent. Research was undertaken in the field of natural gas as a chemical raw material, and promising discoveries were made which will aid in the war emergency and also in postwar problems. Progress was made in the industrial application of radiant gas heat to baking, curing, and drying operations in many fields. Gas fuel now performs a dual service in the two important processes required in the production of enormous quantities of magnesium essential in the building of war weapons.

GENERAL ACCOUNTING OFFICE. An agency of the U.S. Government, created independently of the other agencies, to secure the uniform settlement and adjustment of all claims and accounts in which the United States is concerned. Comptroller General of the United States in 1943: Lindsay C. Warren.

GENERAL EDUCATION BOARD, The. An institution incorporated by act of Congress in 1903, with the stated object of promoting education within the United States of America without distinction of race, sex, or creed. The present program of the board is restricted almost entirely to the support of educational work in the Southern States.

The Board is empowered to spend the income and the principal of its funds. During the year 1943 it appropriated approximately \$2,573,000. Among the larger grants were: \$160,000 to Meharry Medical College, Nashville, Tenn., toward expenses of the Medical School and Hospital; \$158,000 to Virginia Union University, Richmond, to complete construction and equipment of a library and auditorium; \$70,000 to Dillard University, New Orleans, La., toward support of the Division of Nursing; \$50,000 to Morris Brown College for rehabilitation of grounds and building; \$38,000 to Fisk University, Nashville, Tenn., primarily for expenses of teaching and research; \$50,000 to the University of Florida, Gainesville, toward support of studies in nutrition through related basic studies in animal nutrition, soils, and horticulture; \$36,000 to the Association of Colleges and Secondary Schools for Negroes, in support of its secondary school study; \$29,000 to Alabama Polytechnic Institute, Auburn, for research on pasture and forage crops, and \$25, 000 to the same institution for a forestry research project; \$28,630 to the Medical College of Virginia, Richmond, toward support of a study of nursing education; \$27,500 to Southwestern, Memphis, Tenn., toward support of its expanded Music Department, \$25,000 to Talon University of Legislation (1) partment; \$25,000 to Tulane University of Louisiana, New Orleans, toward support of the School of Social Work; \$25,000 to the University of Georgia, Athens, for use in its library; \$21,400 to the State Department of Education in Georgia toward support of a cooperative State program in teacher education; \$20,420 to the University of Kentucky, Lexington, toward support of research in rural population changes in Kentucky; \$20,000 to the Uniresity of Alabama for the use of its Bureau of Public Administration; \$20,000 to The Williamsburg Public Schools, Williamsburg, Va., toward support of the Bruton Heights School, established to provide better educational opportunities for Negroes in the vicinity of Williamsburg; \$15,000 to the National Urban League, Inc., New York City, toward support of a southern field office and field

The executive officers during 1943 were Walter W. Stewart, chairman of the board of trustees; Raymond B. Fosdick, president; Albert R. Mann, vice-president and director; William W. Brierley, secretary; Edward Robinson, treasurer; George J. Beal, comptroller; Thomas M. Debevoise, counsel; Chauncey Belknap and Vanderbilt Webb, associate counsels. Offices: 49 West Forty-ninth St., New York City, N.Y.

GENERAL LAND OFFICE. An Office of the U.S. Department of the Interior which supervises the survey, management, and disposition of the public lands and the minerals therein. At present the Office is making large tracts of land available for military uses. Commissioner in 1943: Fred W. Johnson.

GENERAL SCHEDULING ORDER. See WAR PRODUCTION BOARD under Balanced Production.

GEOGRAPHICAL NAMES, U.S. Board on. A branch of the U.S. Department of the Interior, successor to the U.S. Geographic Board, which is the official authority on the use of geographic names by the Government. Director in 1943: Meredith F. Burrill.

GEOLOGICAL SURVEY, U.S. Shoulder to shoulder with other governmental agencies speeding the war program, the Geological Survey in 1943 eclipsed its previous records of accomplishment in the fields of science and engineering. In every State of the Union and its Territories specialists carried on their investigations and surveys, but their activities extended far beyond territorial boundaries. Mexico and other American Republics were visited in the search for minerals needed for war, and in some instances Survey geologists went ashore with the first landing troops in quest of water for the fighting men. States and their political subdivisions and other Federal agencies contributed about six of the 11 million dollars that was made available to the Geological Survey in 1943, a notable year for cooperative effort. Field examinations of mineral deposits and mining districts numbered more than 700; about 4,000 war reports relating to water were submitted; and approximately 20,000 square miles of strategic areas in the United States proper were covered by surveys for topographic or planimetric maps. Alaska, once a vulnerable outpost, also was the scene of much activity in the way of geologic investigation and topographic mapping.

Numerous investigations of deposits of deficient minerals were conducted jointly with the Bureau of Mines. In an outstanding example of this joint work, the Survey continued the vanadium investigations, particularly those of the Colorado Plateau and Idaho-Wyoming deposits, estimating the reserves of ore and initiating drilling programs in geologically-favorable areas. With the view to further coordinating the Survey's work with that of the Bureau of Mines, regional offices were established at Salt Lake City, Utah, Spokane, Wash., Rolla, Mo., and College Park, Md. Furnishing the necessary geologic information, the Survey recommended to the Bureau the exploration of numerous chromite deposits in California, Montana, Oregon, and Georgia. Sufficient reserves were shown in the more than 100 deposits examined in those States to justify the erection of mills that were soon producing at least 90 per cent of the domestic

chrome.

Continuing the mapping of the Arkansas bauxite district, the Survey recommended extensive exploration. About 20 areas were drilled on the Survey's advice, resulting in the discovery of deposits of 3½ million tons of bauxite ore more than 8 feet thick and containing more than 32 per cent of valuable alumina. Success also crowned the Survey's work on the bauxite-bearing beds of the Coastal Plain of Tennessee, Mississippi, Alabama, and Georgia. Drilling as proposed by the Survey revealed nearly a million tons of commercial ore. Tungsten, manganese, and mercury also claimed

a good share of the geologists' attention during the year. Detailed records of the history, geology, etc., of all known manganese deposits, mines, and prospects in the United States were completed, as were studies of the mineral in California, eastern Tennessee, and the Batesville district, Arkansas. Studies of manganese were continued in active areas in 18 other States. Most of the western States and several eastern States were the scene of tungsten examinations, with more than 200 individual deposits having been studied. At the end of the year most of the more important mercury-producing areas had been mapped in detail, and as a result new ore reserves, notably at New Idria, Calif., were made known and the Survey had a working basis for exploration and development elsewhere. The pressing needs of the steel industry directed attention to a number of projects involving iron-ore supplies. Deposits were examined in 22 States, particular attention being given to locating accessible reserves of low phosphorus ores. Search was also made for additional deposits of coking coal suitable for western steel plants, and some studies were completed of areas that seemed likely to yield promptly additional supplies of oil, and progress has been made in investigations of numerous other such areas. Information on additional resources of helium resulted from a survey in cooperation with the Bureau of

The Geological Survey was actively engaged on 37 geologic projects in Alaska, much of this work being done at the request of and with funds transferred from the War Production Board. Included in the program were investigations of antimony ores, iron, chromium, mercury, nickel-copper, tin, copper, molybdenum, tungsten, zinc, and barium. These investigations took the Survey specialists to southeastern Alaska, Prince William Sound-Copper River region, Cook Inlet-Alaska Railroad region, Kuskokwim region, and western Yukon-Seward

Peninsula region. Sponsored largely by the Department of State and by the Board of Economic Warfare, geologic work in the other American Republics continued with gratifying results. In Brazil it concerned nickel, beryl, and mica; in Argentina, tungsten, beryl, and tantalum; in Colombia, quartz, mica, molybdenum, copper, and mercury; in Panama, manganese; in Cuba, chromite, manganese, copper, and zinc; in Venezuela, mica, quartz, and nickel; and in Mexico, tungsten, manganese, antimony, fluorspar, mercury, and molybdenum. Explorations in Mexico resulted in (1) a notable increase in mercury production in the largest producing district and (2) the discovery of a district that promised to be an active and significant producer of tungsten. Work in Cuba also contributed to the year's geologic lore in revealing considerable reserves of chromite. Aluminum ores in a novel environment were discovered in the Caribbean area, and a reconnaissance of that region was ordered in the hope of finding other deposits of similar magnitude and grade.

In the field of topographic mapping the Survey's work in the United States centered on areas of strategic importance, as selected by the War Department. For the many new areas designated as strategic, an unprecedented amount of transit traverse was required in order to establish control. Maps of the regions were produced largely from aerial photographs in the Survey's offices in Washington, D.C., and in the field offices at Clarendon, Va., Chattanooga, Tenn., Rolla, Mo., and Sacramento, Calif. In the main office at Clarendon large

production facilities were operated on a two-shift basis, and a central laboratory was maintained for designing, testing, repairing, and adjusting all types of special optical and mechanical equipment utilized for stereophotogrammetric work. There, too, a photographic laboratory specialized in research and precision photography required for field offices. Cooperative mapping projects were conducted in 17 States and in Puerto Rico, as well as with the Tennessee Valley Authority, and work was continued on the Transportation Map of the United States, 68 sheets of which have been prepared for publication. Reconnaissance surveys were made of two areas in Alaska not theretofore adequately surveyed. The compilation of aeronautical piloting maps for the Army Air Forces—an office project on which the services of more than 250 employees were engaged—was continued.

Every State and Hawaii cooperated in the Survey's all-important work in hydrology and hydraulic engineering. Such cooperation generally takes the form of agreements to pay 50 per cent of the cost of water-resources investigations. The War and Navy Departments and a dozen other Federal agencies supplied the funds for such investigations as could not be financed by the Geological Survey or included in cooperative programs. Contributions of the States and funds transferred from other Federal agencies amounted to about 57 per cent of the funds provided for water-resources investigations, an indication of the high esteem in which this work is held. The several thousand war reports mentioned at the outset dealt with the quantity and chemical quality of available water, information that was essential to the building of cantonments, naval stations, military hospitals, air fields, and the like for direct use of the armed forces and of munitions industries, hydraulic and steam power plants, etc., on the home front. Both surface and underground waters were covered by the reports. Records of stage, quantity, or availability of surface waters were collected at about 5,000 gaging stations; periodic measurements of water levels or artesian pressure were made in about 7,000 observation wells; more than 8,000 chemical analyses of water samples were made in the several laboratories of the Survey, in Washington, D.C., and elsewhere; and a variety of hydrologic and hydraulic studies and compilations were made on the utilization and control of streams, the monthly summary of stream-flow and ground-water conditions throughout the United States and Canada being published in the Water Resources Review.

As consultant and adviser in geology to other Federal agencies, the Survey acted upon 7,900 mineral-classification cases involving from one to many geologic determinations. In furtherance of the work, geologic investigations were made of coal, oil, and gas in Colorado, Montana, New Mexico, Oklahoma, South Dakota, Utah, and Wyoming, and of geologic conditions at one dam site in Washington. This and its mineral-leasing activities went far toward increasing the contribution of public-land resources to the war program. Supervision was given to operations for the development of power and the production of minerals, including oil, gas, coal, potash, sodium, lead, and zinc from public lands, Indian lands, and naval petroleum reserves. At the close of the fiscal year there were more than 5,000 public-land properties under supervision. Notable in this connection was the discovery and development of helium-bearing natural gas on the Navajo lands in New Mexico.

The Geological Survey published more than 2,000,000 copies of maps and reports in 1943, and distributed about 1,000,000 copies. Approximately half a million maps were delivered to the War Department. See Photography.

provinces annexed from Poland, displacing 1,500,000 to 2,000,000 Poles who were deported to Germany proper or to the Government General of Poland. An additional 66,000 German-speaking inhabitants of the Italian Tyrol were transferred to Austria and other districts of Greater Germany up to March, 1941, under the German-Italian agreement of Dec. 21, 1939 (see 1939 Year Book, p. 388). According to the 1939 census, there were 330,892 Jews and 72,783 half-Jews in Germany, Austria and Sudetenland. By Dec. 31, 1941, this number had been reduced to about 200,000; further deportations of Jews, mainly to the Government General of Poland, took place during 1942–43.

The rates for living births and non-military deaths per 1,000 inhabitants for Greater Germany (including Austria, Sudetenland, Danzig, and Memel) were as follows during 1938–42:

|                  | 1938           | 1939         | 1940         | 1941                | 1942         |
|------------------|----------------|--------------|--------------|---------------------|--------------|
| Births<br>Deaths | $19.0 \\ 12.0$ | 20.4<br>12.6 | 20.4<br>13.0 | $\frac{18.8}{12.3}$ | 15.2<br>12.1 |

Populations of the chief cities at the May 17, 1939, census were: Berlin, 4,332,242; Vienna, 1,918,462; Hamburg, 1,682,220; Munich, 828,325; Cologne, 768,426; Leipzig, 701,606; Essen, 659,871; Dresden, 625,174; Breslau, 615,006; Frankfort-on-Main, 546,649; Düsseldorf, 539,905; Dortmund, 537,000; Hanover, 472,527; Stuttgart, 459,538; Duisburg-Hamborn, 431,256; Nuremberg, 430,851; Wuppertal, 398,099; Königsberg, 368,433; Bremen, 342,113; Chemnitz, 334,563; Magdeburg, 334,358; Gelsenkirchen, 313,003; Bochum, 303,288; Mannheim, 283,801; Kiel, 272,311; Stettin, 268,915; Halle-on-Saale, 220,364; Kassel, 217,085; Graz, 210,175; Brunswick, 201,306.

Education. Primary education is compulsory and there is little illiteracy. Excluding Austria and the Sudetenland, there were 50,592 elementary schools and 7,503,195 pupils in 1939, as compared with 51,118 schools and 7,596,000 students in 1938. In Austria there were 4,721 schools and 657,000 pupils; in the Sudetenland, 2,957 schools and 274,000 pupils. Other school enrollment (in 1937–38) was: Intermediate, 272,365; "gymnasien" and "realschulen," 370,985; universities and advanced schools, 69,981 (universities, 45,989; advanced technical schools, 9,554; others, 14,438). There are three special colleges for the training of Nazi political leaders.

Religion. According to the 1933 census, 62.7 per cent of the German people were Protestants affiliated with the various Evangelical Churches, 32.5 per cent were Roman Catholics, 0.7 per cent were Jews, and 4.0 per cent professed other religious faiths. Beginning in 1934 the Hitler Government undertook to unite the Evangelical churches under a bishop appointed by the Reichsfuehrer, and

III. OCCUPIED TERRITORIES

| Territory   | Date of occupation   | Area<br>sg. miles                            | Estimated population  |
|---|--|--|---|
| Bohemia- Moravia a. Poland. Denmark. Norway. Netherlands. Belgium. France. Yugoslavia. Greece. made other efforts to coordinate the policies of the Evangelical and Catholic churches with the policies of the Nazi party and state. This provoked a serious conflict (see Year Books for 1933–43). The Government also sponsored a neo-pagan German National Church based on doctrines of the official Nazi party philosopher, Alfred Rosenberg, but it gained relatively few adherents. According to statistics issued by the Reich Ministry of Church Affairs in 1941, there were 45,000 Evangelical pastors and other church functionaries excluding Austria and the Sudetenland, 9,300 Evangelical church establishments with 72,000 employees, 33,000 Roman Catholic priests, and 8,650 Catholic religious centers with over 100,000 monks and nuns. The number of school children belonging to Evangelical churches was 4,353,435; to the Catholic Church, 2,803,138.

Production. According to German statistics based on the 1939 census, there were on that date 39,-792,000 gainfully employed persons in Germany (including the Saar, Austria, and Sudetenland but excluding Memel), an increase of 29.6 per cent since 1933. Of the employed population, 41.5 per cent were engaged in industry and handicraft, 27.3 per cent in agriculture and forestry, 17.2 per cent in commercial service, 10.2 per cent in public service, and 3.8 per cent in household service. Before the end of 1943 large numbers of employed Germans were absorbed by the armed forces, their places being taken by some 6,000,000 foreign workers and war prisoners (see below under History).

The national income, estimated at 80 billion reichsmarks in 1938, was reported by the German Finance Minister to be 110 to 115 billions in 1941.

The gross value of farm production in the harvest year 1938–39 was 14,050,000,000 reichsmarks. Estimated production of potatoes in Greater Germany was 58,900,000 tons in 1940 (including Austria and Sudetenland); sugar beets, 18,400,000 tons. Yields of chief cereals in 1939 were (in metric tons): Wheat, 5,613,500; barley, 4,261,800; rye, 9,454,800; oats, 6,867,700; and corn, 379,600 (1938). In 1940 Germany devoted 918,840 acres to rapeseed, flax, and hemp. Meat production in 1938 totaled 3,676,800 metric tons, of which hogs accounted for 2,305,600 metric tons. The livestock census of December, 1939, showed 19,900,000 cattle, 25,200,000 swine, 4,900,000 sheep, 3,442,741 horses (1938), and 2,300,000 goats. The 1939 wool clip was about 20,500 metric tons. Forests, covering 42,796,000 acres, were an important adjunct of the German economy. German sea fisheries in 1938 caught 722,000 metric tons of fish valued at 104,200,000 reichsmarks.

No official figures on mineral and metallurgical production were published after 1938. The U.S. Bureau of Mines estimated the 1940 output of Germany and Austria as follows (in metric tons): Coal, 450,000,000; iron ore, 15,000,000; pig iron, 22,000,000; nickel, 600; copper, 36,000; zinc, 220,000; lead, 190,000; antimony, 180; bauxite, 20,000; aluminum, 240,000; magnesium, 25,000; mercury, 65; petroleum and substitutes, 26,263,000 bbl. Early in 1942 Germany's capacity for producing synthetic petroleum, lubricating oils, and other motor fuels was estimated at 5,200,000 metric tons. The total synthetic and natural oil production under Axis control was placed at slightly more than 12,000,000 tons. Rayon production of Germany and Austria in 1940 was about 80,000 metric tons; wood pulp, 2,927,000 tons in 1939. As one of the world's three leading industrial nations, Germany produces a wide variety of other manufactures. Arms and other war production monopolized an increasing share of its productive facilities after 1933. In 1942 about 80 per cent of all industrial production was estimated to be for war purposes.

Foreign Trade. No statistics have been published since the outbreak of the World War. For prewar

figures, see 1942 YEAR BOOK.

Finance. Publication of a regular budget was discontinued in 1934. According to the Minister of Finance, the public revenues rose from 80 billion marks in 1938–39 to between 110 and 115 billions for the year ended Mar. 31, 1942. Budget operations for the years 1938–39 to 1942–43 were shown in part as follows in the League of Nations' Monthly Bulletin of Statistics for August, 1943.

GERMAN BUDGET OPERATIONS
(In millions of marks)

Excluding war contributions of local authorities, net receipts from public enterprises (3-4 billions yearly), and occupation costs from occupied countries. \*Total of tax receipts and net borrowings. \*End of calendar years 1939, 1940, 1941, 1942, and June 30, 1943. \*Estimates.

The figures given in the table show only part of the total governmental receipts and expenditures. Total war expenditures for the fiscal year 1941–42 were estimated by one authority at about 100 billion marks, of which 52 billions were obtained by internal borrowing, 32 billions by taxation, 6 billions from octer internal revenue, and 10 billions from occupation costs levied on conquered countries. An additional 7 billion marks was borrowed in conquered countries from banks, through unpaid clearing balances, and from other sources.

Reichsbank currency notes in circulation increased from 11,798 million marks on Dec. 31, 1939, to 25,375 billions on Dec. 31, 1942, and 26,650 billions on June 30, 1943. At the official exchange rate, 2.50 reichsmarks were equivalent to \$1.00 in 1942. The nominal average rate for the reichsmark remained at about \$0.40 during the

period 1938-43.

Transportation. The total railway mileage in Germany and German-occupied countries was 109,904 (excluding occupied France) on Dec. 31, 1940, compared with 86,000 miles on Oct. 1, 1939 (about 42,300 miles in Germany proper). Extensive construction of strategic railways was carried on in Russia and other occupied territories during 1941–43. Partly through territorial annexations, the German highway network increased from 132,094 on Mar. 31, 1937, to 263,267 miles in 1940, including over 2,000 miles of express highways. The length of German air services in operation on Oct. 22, 1940, was officially reported as 7,457 route miles. The Deutsche Lufthansa A.G. was reported in August, 1941, to be operating about two-fifths of the lines in service prior to the war.

Inland waterways extend more than 7,000 miles (canals, 1,450 miles). Further extensions to the canal system were under construction in 1941–43, including the Oder-Danube and Rhine-Main-Danube canals. As of June 30, 1939, the German merchant marine comprised 2,466 ships of 4,492,708 gross tons. A large part of this fleet was subsequently lost through enemy action or requisitioned

by neutral governments.

Government. Under the Enabling Act of Mar. 24, 1933, giving the cabinet unrestricted powers to legislate by decree, dictatorial powers were assumed by Adolf Hitler in his dual capacity as Chancellor (appointed Jan. 30, 1933) and head of the National Socialist (Nazi) party, the only legal political organization. Upon the death of President von Hindenburg, Aug. 2, 1934, Hitler assumed the functions of both Chancellor and President under the title of Leader (Fuehrer) and Chancellor (Reichskanzler). On Oct. 16, 1934, it was officially announced that Hitler would occupy both offices for life. On Apr. 26, 1942, the Reichstag approved a decree empowering the Fuehrer, without recourse to legislation, "to compel every German . . . by all means he deems suitable to fulfill his duty, and, in the event of his neglecting his duty, duly to punish him . . . without regard to relieve him of his rank or office without instituting the prescribed proceedings."

Rights of the former Federal States were abolished by the decree of Feb. I, 1934. Between 1933 and 1943, the Nazi party progressively brought under its control not only the government and the army but virtually all departments of political, cultural, social, and economic life (see preceding Year Books). The Reichstag of 855 members was elected Mar. 29, 1936, and Apr. 10 and Dec. 4, 1938, from nominees selected by the Nazi party. The addition of new members to represent newly annexed territories increased the total to 873 by July, 1940. It was a purely advisory body, meeting infrequently at the call of the Fuehrer. By a decree

issued Jan. 29, 1943, the life of the Reichstagelected in 1938 was prolonged until Jan. 30, 1947.

Hitler administered Germany through a Cabinet of 19 members. For the Cabinet list at the beginning of 1943 and the date of appointment of each member, see the 1943 YEAR BOOK under Government. For changes during 1943, see below under History. Local administrative authority was divided between the Statthalters (Governors) of the 17 former Federal States (Länder), who were under the direct control of the Minister of Interior, and the Gauleiters, or Nazi party chiefs, of the 42 party districts into which the country was divided. The decree of Dec. 11, 1942, made each party district a Reich Defense Area and vested the Gauleiters with the authority of Reich Defense Commis-

On Aug. 30, 1939, Hitler named an Inner Council of Defense consisting of Marshal Goering (chairman), Rudolf Hess, Ministers Frick, Funk, and Lammers, and Gen. Wilhelm Keitel, chief of the general staff. The Council was authorized, in the event of Hitler's absence, to issue decrees and ordinances without his signature. In a speech to the Reichstag on Sept. 1, 1939, Hitler designated Marshal Goering as his successor "if anything should happen to me in this struggle." He named Rudolph Hess as Goering's successor. After Hess's Indianated Hitler Struggle. imprisonment in Britain, Hitler on Feb. 15, 1942 named Richard Bohrmann to be second in line of succession. For developments in 1943, see below.

### HISTORY

Trend of the War. The military and diplomatic events of 1943 confirmed the worst fears aroused in Germany by the costly setbacks of 1942 (see 1943 YEAR BOOK). The Red Army followed up its smashing victory at Stalingrad with continuous great offensives that wrested from Hitler's grasp some two-thirds of the Russian territories conquered at such heavy cost in 1941 and 1942. The German submarine campaign was conclusively defeated, paving the way for a large-scale Anglo-American invasion effort in Western Europe in 1944.

British and American air raids, rising to a new pitch of effectiveness and intensity, desolated the cities of western and central Germany. These raids seriously hamstrung German war production, burdened the nation with the care of hundreds of thousands of homeless, destitute, and demoralized civilians, and forced the German High Command to use a large proportion of its fighter planes defensively in northwestern Europe. Meanwhile Allied forces in North Africa defeated and captured a German-Italian army of some 200,000 men in Tunisia. They successfully invaded Sicily and the Italian mainland, forced Italy out of the war, and gained effective control of the Mediterranean.

These events shook to its foundations the formidable edifice of German power. The conviction that Germany faced inevitable defeat, barring unforeseen developments, spread throughout the Axis world. Finland, Bulgaria, Hungary, Rumania, and the other Axis satellites intensified their efforts to escape involvement in the impending German collapse. The Franco Government in Spain substituted neutrality for its openly pro-Axis policy of nonbelligerency. Bolivia, Colombia, Iran, and Portugal hastened to board the Allied bandwagon. Turkey prepared to do so at the opportune moment. Chile severed diplomatic relations with the Axis Powers, aligning all of the 21 American republics except Argentina on the side of the United Nations. Sweden became more aggressively defiant in rejecting German pressure for collaboration with the Axis cause. Revolt and underground warfare spread among the German-occupied countries.

Climaxing this ominous encirclement and undermining of Hitler's "European fortress" was the agreement concluded by American, British, and Soviet war leaders at the Tehran Conference in December for closer collaboration in pushing the war to an early conclusion (see United Nations). The conference virtually ended German expectations of a breach between Communist Russia and the Anglo-American democracies that would enable the Third Reich to avert unconditional surrender.

By the end of 1943 Germany had suffered an estimated 2,500,000 military deaths, as compared with 1,773,700 in World War I. The German homeland, which emerged virtually unscathed from the physical destruction of the first World War, was already the scene of vast devastation. Toward the year's end Allied air basis were established in Italy and western Russia. They brought the hitherto relatively untouched cities of eastern and southern Germany within bombing range.

The German people were fatigued and dispirited by more than four years of total war following upon seven years of feverish preparation for war. Their huge blood sacrifice, the surrender of their liberties to Nazi totalitarianism, and the expenditure of over \$100,000,000,000 for war purposes since 1933 had gained them only the prospect of a

worse defeat than in 1918.

Nevertheless Hitler still had formidable military power at his disposal. Rallying his fanatical followers for a last-ditch fight against enemies at home and abroad, he ordered the ruthless extermination of defeatists and critics. At the same time Nazi propaganda dinned into all ears a warning of the terrible fate that awaited a defeated Germany at the hands of the Allies. Under this twin threat, the German armies and people fought doggedly on into the climactic year of the war-

Nazism on Defensive. The long succession of stunning defeats inflicted upon German arms on land, sea, and air between November, 1942, and December, 1943, brought an enormous loss of prestige to the Nazi party, leaders, and government. It aggravated the conflict between the party and the army leaders, initiated a gradual process of disintegration within the party, and spurred growing numbers of Germans to turn away from Hitler and his associates in search of more effective leadership.

A defensive note entirely foreign to his usual confident forecasts of victory was struck by Hitler on January 1 in a New Year's message to the German people, issued from his headquarters in Russia. He warned that severe hardships lay ahead during 1943, but declared that Germany would never consider capitulation and would fight on against all obstacles to "a definite victory." He emphasized that "the surest guarantor for the strength of will necessary for the completion of

this task is the National Socialist party.

The tenth anniversary of Hitler's accession to power on Jan. 30, 1943, coincided with Berlin's admission of the loss of some 330,000 men and 17 generals in a Russian trap sprung on the German and Rumanian forces besieging Stalingrad. For the first time since 1933 Hitler failed to appear at the Nazi party celebration of the anniversary. But his proclamation warning the German people that they faced enslavement to bolshevism unless they fought on to the end was read by Propaganda Minister Goebbels. Goebbels and Reich Marshal Hermann Goering, in a broadcast that was twice interrupted by the attacks of British Mosquito bombers, undertook to explain the reasons for the German reverses in Russia. Goering frankly admitted that Germany had greatly underestimated

Russian military power.

Emergency Decrees. The Nazi leaders seized upon the apprehension aroused by the debacle at Stalingrad to spur the home front to greater efforts. The Propaganda Ministry on February 3 decreed three days of national mourning for the "Stalingrad defenders." Under the slogan, "total mobilization of the national resources for total war," the Government issued emergency decrees closing all business. ment issued emergency decrees closing all businesses, shops, and offices not directly essential to the war effort in order to release additional manpower for the army and war industries. The decrees overnight reduced the bulk of the German middle class to the status of proletarians. They imposed additional sacrifice and hardship upon every German man and woman.

These decrees were accepted by many Germans as necessary under the circumstances. But the doubts and passive resistance which they aroused were plainly reflected in the Propaganda Ministry's persistent efforts to reassure the dispossessed middle class. Dr. Goebbels repeatedly proclaimed that the emergency measures were essential to avert defeat, that they were of a strictly temporary na-ture, and that those affected would be restored to their former economic and social status at the end

of the war.

The skepticism with which these assurances were received was, not unnaturally, increased by Hitler's speech at the Nazi Heroes' Day ceremonies in Berlin on March 21. He declared that the Nazi state after the war would press forward untiringly with its program for the elimination of all class differences and "the establishment of a true Socialist community." This occasion marked Hitler's first public appearance in Germany since the preceding November. It served to end a flood of rumors alleging that he had been deposed by the army generals or had suffered a nervous break-down. The Fuehrer explained that the celebration had been postponed for a week to allow time for overcoming the military crisis in Russia. He de-clared the Russian front had now been stabilized and that "we have taken measures that will obtain success for us in the months ahead until final victory is achieved.

Like his promise of 1942 that Stalingrad would be taken and held against all comers, this new prediction was not fulfilled. There followed in quick succession the disaster in Tunisia, the virtual obliteration of many cities in western Germany from the air, and the failure of the German summer offensive in Russia. Meanwhile Hitler had returned to his Russian headquarters after his March appearance in Berlin, leaving home-front affairs to his Nazi associates. On April 15 the German news agency D.N.B. sent out a correction ordering editors to eliminate reference to Hitler as "supreme commander of the armed forces" from a previous dispatch. This tended to confirm reports that Hitler had been forced to delegate his powers as supreme military commander to his army generals. On May 15 the German radio announced that Hitler had signed a decree extending indefinitely the dictatorial powers conferred upon him by the

Reichstag on Mar. 24, 1933.

Cabinet Reorganized. The overthrow of Mussolini in Italy, the loss of Kharkov in Russia, and the rapid deterioration of home front morale under the punishing Anglo-American air raids led the

first week in August to an emergency conference of Nazi political and military leaders at Hitler's

general headquarters.

The conference was followed on August 24 by a reorganization of Hitler's Cabinet, in which Heinrich Himmler, while retaining control of the Gestapo and Elite Guard, was appointed Minister of Interior and Chief of the Reich Administration. The hated organizer of Nazi terrorism was thus made master of the home front, except for the control of labor which Hitler assumed personally. Himmler was also designated as second in line (after Goering) to succeed Hitler in the event of the latter's death or incapacitation. Dr. Wilhelm Frick was shifted from the Interior Ministry to replace Baron Constantin von Neurath as Reich Protector of Bohemia and Moravia, but retained a place in the Cabinet. The Himmler appointment was received as a grim warning of the fate awaiting defeatists and noncollaborationists within the Nazi party and the nation.

Growing internal tension was further indicated by the agitation of some Nazi extremists for a purge of lukewarm elements within the party. Some reshuffling of lower party officials took place, but nothing resembling the "blood purge" of 1984. Baldur yon Schirach, Gauleiter of Vienna and former Hitler Youth leader, was reported to have fled to Switzerland when accused of consorting with "reactionaries" and anti-party elements. Vik-tor Lutze, Chief of Staff of Hitler's Storm Troops, who died May 2 of injuries sustained in an automobile accident, was succeeded on August 18 by Gen. Wilhelm Schepmann, Nazi party veteran and chief of the Storm Troops in Saxony.

Bolstering the Home Front. On October 8 Hitler again called home-front leaders to his headquarters for a conference designed to bolster German morale and spur war production. Hitler, Himmler, Armaments Minister Speer, and Admiral Doenitz, commander in chief of the navy, addressed the gathering on steps needed to assure final victory. Himmler issued the significant warning that "isolated cases" of defeatism would be "eradicated without mercy. while Hitler called upon Nazi leaders to stiffen the will power and perseverance of the German people.

A communiqué issued from Hitler's headquarters on October 19 announced that another conference of the highest German military and political authorities had been held for the purpose of overhauling war strategy and methods. Field Marshal Gen. Wilhelm Keitel, chief of the high Command, first called in the highest commanders of the naval, air, and land forces and the chiefs of the German defense districts for a discussion of military problems. Then followed a conference to map out political strategy.

These conferences were accompanied by appeals from Nazi political and military leaders reassuring the German people and urging them to stand fast during the coming winter. Meanwhile Himmler extended his measures to root out disaffection. "Complete subjugation to the will of the Government" was demanded of all Germans on pain of severe punishment or death. Himmler also was reported to have extended his control over military formations on German soil, apparently a move to reduce the growing possibility of an anti-Nazi mili-

Hitler issued new threats of death to "cowards" and "criminals" at home in a speech at Munich on November 8 on the 20th anniversary of the Nazi party's Munich beer hall putsch. Germany's whole destiny and future, he declared, depended on "marshalling the last reserves of strength so we can force a decision in our favor." Promising to exact retribution from Britain for the RAF raids, he declared that "if the German people despair, they will deserve no better than they get." The British answer to this threat was the great raids of late November and December on Berlin, which reportedly forced the Government to move most its administrative machinery to Breslau and other less exposed centers.

Growth of Opposition. Numerous reports emanating from Germany during the year indicated that opposition to the Nazi regime was becoming more widespread and more violent than at any time since 1933. A Swedish correspondent in Berlin reported February 4 that sham window shows in Berlin shops had been banned by the authorities following the smashing of numerous windows by irritated crowds. The secret police were said to have arrested 34 officers at the Military Academy in Charlottenburg on February 25 in one of a series of raids seemingly designed to block a monarchist or rightist coup. About the same time a dozen or more Germans, including several officials, were reported to have been hung for treason. Three students at Munich University were guillotined the same month for distributing anti-Nazi tracts.

The Stockholm correspondent of The New York Times on April 4 reported that the railway bridge across the Oder River at Frankfort had been blown up and bombs exploded in two Berlin railway stations in a wave of sabotage. He also declared that 40 Nazi party members had been executed by the Gestapo for a conspiracy aimed either at Goebbels or Himmler. Among numerous individuals allegedly jailed for "obstructing the war effort" were Dr. Hans Luther, former Reich Chancellor and German Ambassador to the United

In April Berlin confirmed news that five more anti-Nazi conspirators had been executed in Munich and 12 others jailed for printing and distributing tracts calling on the population to sabotage war industries. Most of these conspirators were youths. Apparently the anti-Nazi movement in Munich was related to the growing tension between Nazi authorities and Catholic students in the university towns and cities of southern Ger-

many.

The fall of Mussolini, announced in the Reich July 26, precipitated anti-Nazi and anti-war manifestations among Italian and German workmen in Berlin. During the last four months of the year notices of executions of "defeatists" appeared with increasing frequency in the German press. Any criticism of the Government and the Nazi party or any expression of doubt as to the possibility of a German victory exposed the offender to the death penalty. Swedish newspapers reported in mid-November that a new Nazi decree made children of 12 years (instead of 16) subject to the death penalty. The reign of terror was applied with particular ruthlessness to foreign workers in Germany. But notwithstanding all efforts at repression, competent Swiss and Swedish observers in the Reich reported that pessimism and defiance

were spreading widely among the German people.

Nazi-Church Conflict. The war crisis merely served to intensify the long-standing conflict between the Nazi regime and the Christian churches. On May 12 the Office of War Information in Washington made public the text of a memorial sent to the Nazi Minister of Church Affairs, Dr. Bernhard Rust, on Dec. 18, 1942, by the Catholic bishops of Germany. The memorial attacked in the strong-

est terms the Nazi war on religion. It deplored the Nazi policies in the occupied countries that were creating "ramparts of bitterness and enmity" toward Germany and the Germans. For the text of this important document, see The New York Times,

May 13, 1943.

The Lenten pastoral letter of the Bishops of Cologne and Paderborn contained another outspoken protest against "the introduction of force" to increase both legitimate and illegitimate births. The Fulda Conference of German Catholic bishops in August issued another vigorous denunciation of the Nazi persecution of religion. This attitude was reflected in the growth of anti-Nazi political activities among the Catholic population of southern Germany. The Nazis responded by eliminating the remnants of the Catholic press, extending seizures of Church properties, disbanding more Catholic lay organizations, and removing religious emblems and images from the schools. Hundreds of priests and laymen were thrown into concentration camps for anti-Nazi political activity.

According to a report distributed by the Religious News Service from a reliable Scandinavian source, the Protestant churches in Germany likewise continued to oppose Nazi racial doctrines and ideology despite persistent efforts to divide and weaken them. Early in August the organ of the Swiss Protestant churches reported the imprisonment of a number of German pastors for describing the Allied bombing of German cities as "just retribution for the suffering imposed by Germany on

other peoples.

Decline of Armed Forces. German armed forces at the end of 1943 were still waging stubborn, skillful, and effective warfare against the United Nations forces on all fronts. A U.S. Army Intelligence Service report issued November 11 disclosed that the German High Command had at its disposal 300 well-trained divisions, including 60 new divisions created, reformed, or reequipped during 1943. This was three times as many combat divisions as Germany had in the field when she attacked Poland in 1939.

However many of these divisions were not at full strength. They included the screenings of men of all classes from 17 to 60 years of age, many of whom had been previously rejected for military service. They also included considerable numbers of conscripts from the German-occupied countries, many of whom seized the first opportunity to desert. Military observers reported a marked decline in the striking power of German front-line divisions as compared with the elite units of

1939-41.

The morale of German ground units showed a slight but not a crucial decline, according to reports from various fronts and from the occupied countries. On the other hand the deterioration of the Cerman air force was marked on all fronts. While larger than in 1939, and still dangerous, the Luftwaffe repeatedly proved unable to provide cover for German ground forces on the Russian and Mediterranean fronts. Nor was it able to check the growing Anglo-American air power based on Britain. Reich Marshal Goering was reliably reported to have been forced to relinquish actual command of the Luftwaffe to Field Marshal Erhard

The German navy, which was the first to mutiny 1918, displayed a much more precarious state of morale than either the army or air force. On January 30 it was announced that Adm. Erich Raeder had been replaced as commander in chief of German naval forces by Adm. Karl Doenitz, the

## **REVOLT AGAINST AXIS RULE**

Above: Wanted dead or alive-by Hitler-Generals Draja Mikhailovitch (left) and Josip Broz (Tito), leaders of Yugoslav guerrillas fighting German domination. Below: A batch of German prisoners are marched through a mountain hamlet by their Yugoslav captors. former commander of the submarine fleet. Under Doenitz the German subs made a renewed effort to sever Anglo-American sea communications. The failure of this effort was demonstrated by a Churchill-Roosevelt statement of August 14 announcing that U-boats had been sunk at the average rate of one a day during May, June, and July.

Rear Adm. Francis S. Low, director of the U.S. Navy's anti-submarine warfare, stated on September 28 that the German navy was nearing demoralization and had been forced to draft submarine crews. According to Swedish reports, there were mutinies and other evidences of declining discipline among German submarine crews stationed in Norway. The crews of three German capital ships based on Alten Fjord, Norway, reportedly at-tempted to sabotage the vessels upon receiving news of the surrender of the Italian fleet.

The continued enmity and undercover struggle for power between Hitler and his Nazi associates on the one hand and the nonparty professional army officers on the other contributed to the deterioration of morale in the armed forces. Hitler's relations with his non-Nazi commanders remained a subject of intense speculation. He was apparently induced to relinquish actual direction of the Russian campaign early in 1943. But in July and again in October, he was reliably reported to have intervened to change the plans of the High Command in Russia, with the customary disastrous re-

From time to time there were further reports of the replacement of nonparty professional com-manders with Nazi generals. In mid-December Field Marshal Gen. Erwin Rommel was said to have been placed in charge of German defenses in western Europe. At the same time it was re-

ported that Gen. Richard Jungklaus, a Nazi officer, would succeed Baron Alexander von Falkenhausen

as German military commander in Belgium. To add to the complexity of the military situation, there were repeated threats from Nazi officials to retaliate for Anglo-American "terror raids" by introducing devastating new weapons of war-fare. Indications that the Germans were preparing to resort to gas warfare led President Roosevelt on June 8 to warn that a gas attack upon any of the United Nations would "immediately be fol-lowed by the fullest possible retaliation. . . ." In December it was reported from Switzerland that the Germans were preparing to bombard London from the French coast with powerful, long-range rockets.

War of Propaganda. As the fortunes of war turned steadily against the Axis, the Hitler regime intensified its propagandist efforts to bring about a split between Russia and the Anglo-American powers. The danger that bolshevism would overrun Europe if the German armies were defeated was-emphasized in every speech of the Nazi leaders and in daily radio broadcasts to all parts of the world. At the same time Berlin sought to deepen Moscow's suspicions of its capitalist allies. This propaganda was accompanied by repeated undercover efforts to conclude a separate peace with either Russia or with Britain and the United States, which would enable the Third Reich to retain most of its newly conquered empire. Late in November it was reported that Franz von Papen, the German

ambassador to Turkey, was in Rome seeking to enlist the aid of the Vatican in peace negotiations.

A major objective of the strategy behind the great German withdrawal in Russia was to facilitate a falling out between Russia and her allies

over the future conduct of the war and the conditions of the peace. It was to prevent this that the conference of British, American, and Soviet For-eign Ministers was held in Moscow early in No-vember and that the Stalin-Churchill-Roosevelt meeting followed in Tehran in December. The success of these conferences in reaching agreement upon the major war and postwar issues in dispute among the three great Allied powers appeared to have sealed Germany's doom.

Economic Mobilization. Nazi Germany's last hope of survival now lay in prolonging the war and staving off invasion of the Reich until war weariness among the Allies presented an opportunity for a compromise peace. To make this possible the Nazis worked with feverish intensity to mobilize all military and economic resources of Germany and the occupied countries. The number of workers employed in war industries in German-dominated territories increased from 23,000,000 at the outbreak of the war to an estimated 35,000,000 in November, 1943. In the Reich alone there were more than 28,000,000; of these over 12,000,000 were foreign workmen who had been conscripted or who had volunteered for labor in German factories.

Wholesale conscription of manpower in the occupied countries and the extension of labor conscription to German women enabled the Nazis to channel the great majority of physically fit German men into the armed forces. The economic and financial resources of Germany and the occupied countries were enlisted in the war effort with equally ruthless efficiency. According to the British Ministry of Economic Warfare, the Germans up to Sept. 30, 1943, had plundered \$18,000,000,000 from the occupied countries in occupation costs and forced exports paid in blocked paper marks which could not be taken out of Germany. This was exclusive of goods of all kinds that were confiscated or stolen and sent to Germany. As a result war production remained high despite the dislocations and destruction wrought by Allied air raids.

The German food rations in the winter of 1943-44, while poor in quality, were higher in caloric content than at the outbreak of hostilities. On the other hand there were many evidences of the intense strain upon the civilian population imposed by total mobilization, further extension of working hours, the elimination of vacations, and the growing scarcity of all kinds of consumer goods. On July 22 Berlin dispatches announced the modification of the economic mobilization decrees of January 27 and 29 to permit the reopening of

many closed retail shops.

Atrocities. While economic mobilization was speeded, the Hitler regime broadened and intensified its program of terrorism and extermination in the occupied countries, with the object of curbing sabotage, forestalling revolt, and permanently weakening the enslaved nations. The Inter-Allied Information Committee in London on February 27 estimated that nearly 3,400,000 persons had been executed or had died in prisons in nine Germanoccupied countries up to the end of 1942. In an official incomplete account of Axis war crimes in occupied Europe published August 26, the Committee stated that Germany and its satellites were carrying out at an increasing tempo a deliberate program of wholesale theft, murder, torture, and savagery. It charged that this was part of a premeditated plan to liquidate entire peoples.

At Hitler's personal instigation, the Jews, Poles, and Russians bore the brunt of the campaign of extermination. Deportations of Jews were speeded

up from Western Europe to the Government General of Poland, which had been converted into a veritable slaughter pen by the Nazis. The Nazi anti-Jewish program was introduced into Denmark for the first time, over the strenuous protests of the Danish population. It was placed in more widespread operation in all of the other Germanoccupied and satellite countries. According to a report issued in New York August 26 by the Institute of Jewish Affairs of the American Jewish Congress and World Jewish Congress, more than 3,000,000 European Jews had been destroyed by planned starvation, forced labor, deportations, and methodical massacres since the beginning of the

Rallying the Axis. In addition to the foregoing efforts, the Nazi regime sought to rally its Axis partners in support of a unified and more vigorous prosecution of the war. Early in the year repeated appeals were made to Tokyo for a Siberian diversion to relieve Russian pressure upon Axis armies in Europe, but without success. The second week in April Mussolini during a four-day conference at Hitler's headquarters appealed for more German guns and planes to defend Italy against invasion from North Africa. But German aid proved insuf-ficient to prevent the overthrow of Hitler's principal Axis associate on July 25, and the capitulation of the Badoglio Government to General Eisenhower early in September. Then came the declaration of war against Germany by the Italian Government on October 13.

The collapse and surrender of the Italians, branded as a cowardly betrayal by Berlin newspapers, was a body blow to Germany from both a military and psychological standpoint, although it relieved some of the economic strain that support of the Italian war effort had imposed on the Reich. By occupying Rome and the Vatican City, replacing Italian garrisons in the Balkans and Mediterranean islands, freeing Mussolini from his anti-Fascist captors, and holding the Allies at bay in southern Italy, the Germans managed to salvage something from the Italian debacle. Mussolini's proclamation of a "Republican Fascist Government" under German auspices restored some semblance of the defunct Rome-Berlin Axis. It enabled the Propaganda Ministry in Berlin to celebrate the third anniversary of the signing of the Tripartite Pact with Italy and Japan on September 27 by broadcasting assurances from Mussolini and the Japanese Foreign Minister that the Axis alliance remained unbroken.

Mussolini's role, however, was now that of a mere puppet, valuable only for propaganda purposes. On December 11, the second anniversary of the German and Italian war declarations against the United States and of the German-Italian-Japanese agreement not to sign a separate peace, Mussolini joined Foreign Minister von Ribbentrop in broadcasts designed to bolster confidence in Germany's military position. The same three powers had signed an agreement for economic cooperation on January 20 and an agreement on war and postwar politico-military collaboration on March 22.

There was a steady procession of leaders of the

smaller Axis powers to Hitler's headquarters in April, and some of them were recalled several times during the remainder of the year. But the Fuehrer's demands for larger contributions of troops and supplies to the Axis war effort met with greater resistance than in previous years. Bulgaria, Hungary, and Rumania, in particular, demanded greater guarantees in their trade negotiations with the Reich and increased the prices of their products

to compensate for the hard terms exacted by the Germans earlier in the war. All of the German satellite countries reduced their military contribu-tions. Only the threat of German military occupation prevented most of them from withdrawing

from the struggle.

RONALD STUART KAIN.

GESTAPO. See GERMANY, the German-occupied countries, Bulgaria, Hungary, Italy, Rumania, and Yucoslavia, under History.

GIBRALTAR. A British crown colony and fortified naval base at the western entrance to the Mediterranean. It comprises a long mountain called the "Rock" which has an extreme height of 1,896 feet. A canal, 20 feet wide, built across the isthmus as a wartime safety precaution, now separates Gibraltar from the mainland. There is a deep-water Admiralty harbor with an area of 440 acres, containing three graving docks. Area, 1% square miles. Total fixed population (Jan. 1, 1939), 20,339, of whom 16,000 were evacuated to Great Britain, Madeira, and Jamaica because of the danger of heavy casualties in case of heavy attacks from the air.

Trade. Gibraltar, a free port and tourist resort during peacetime, does an extensive shipping trade. The chief occupations of the people were the supply of fuel and provisions to shipping and the transit of cargoes to Spain and Morocco. Shipping (1938): 4,752 ships (13,772,321 tons) cleared.

Government. Chief sources of revenue are the port dues, rent of the Crown estate in the town, and duties on wine, tobacco, spirits, beer, gasoline, and perfumery. In 1938 revenue totaled £207,628 and expenditure £199,725. The Governor is assisted in the administration by an executive council of seven members. There is no legislative council, the power to legislate being vested in the Governor who, in addition, is the general officer commanding the garrison. Governor and Commander in Chief, Gen.

F. N. M. MacFarlane (appointed May 30, 1942). History. On Aug. 30, 1943, the Supreme Court of Gibraltar sentenced to death Luis Lopez Cuenca of La Linea, Spain, charged with the possession of a German bomb intended to blow up the ammunition tunnel in the dockyard. At a second trial a Spanish dockyard worker was sentenced to death for setting fire to a dockyard on June 30.

GILBERT AND ELLICE ISLANDS. A British colony in the southwestern Pacific, consisting of the Gilbert group of 16 atolls (Abaiang, Abemama, Aranuka, Arorae, Beru, Butaritari, Kuria, Maiana, Makin, Marakei, Nonouti, Nukunau, Onotoa, Tabiteuea, Tamana, Tarawa), the Ellice group of 9 atolls (Funafuti, Nanumaga, Nanumea, Niutao, Niulakita, Nui, Nukufetau, Nukulaelae, Vaitupu), the Phoenix group of 8 atolls (Birnie, Canton, Enderbury, Gardner, Hull, McKean, Phoenix, Sydney), and the distant Ocean, Fanning, Christmas, and Washington islands. All are of coral origin except Ocean Island. Total area, 216 square miles. Population, 1938 estimate, 35,000.

Production, etc. The principal crops are coconuts and pandanus fruit. Ocean Island has rich phosphate deposits (325,000 metric tons exported during 1939). In 1938—39 imports were valued at £178,767 and exports at £279,438. Finance (year ended June 30, 1940): revenue £67,846; expenditure £79,543. The colony is administered by a resident commissioner (with headquarters on Ocean Island), who is subordinate to the British High Commissioner for the Western Pacific (with headquarters in Fiji).

History. Japanese armed forces occupied some of the northernmost islands of the Gilbert group late in November, 1941, constructed an advance naval air-base on Makin, and fortified Tarawa. Late in November, 1943, armed forces of the United States recaptured the Japanese-held Gilbert Islands (Abemama, Makin, and Tarawa) after an engagement which lasted for 76 hours. See WORLD WAR.

Glider Bomb, under Axis Types.
GLYCERINE. See CHEMISTRY under Explosives. GOA. See PORTUGAL under Colonial Empire.

GOLD. In forced eclipse because of the war, gold mine output during 1943 continued its sharp downward trend commenced in 1942. Most domestic gold production was a by-product of the mining of such essential metals as lead, zinc, and

copper. The full force of War Production Board order L-208, practically halting the operation of all mines whose principal product was gold, was felt in 1943. In actual administration, the stringent terms of the order were softened somewhat. Lode mines employing eight or less men, which could show that their employees were not needed elsewhere in war industry and that their critical material re-quirements were small, were given individual per-mits to operate on a limited scale. Mines whose ore contained appreciable quantities of essential minerals were allowed to recover the gold contained in the ore, upon special application. Several gold dredging companies were permitted to operate portions of their fleets in order to prevent undue economic hardship. The big, highly mech-anized lode mines whose principal product was gold, were effectively closed, however, and their elimination caused the total 1943 mine production of gold to fall to slightly more than a third of 1942 output, or about a fourth of the 1941 total. Moreover, most of the large base metal mines in the far west were handicapped by labor shortage; thus, their gold production decreased along with their essential mineral output.

Canadian mines operated under labor and material restrictions so stringent that most of them were forced to close, or operate on a very limited scale. Central and South American dredges con-tinued to operate, but their imports of material and equipment from the United States were limited by shipping space and export restrictions, as well as by lack of priorities.

United States mine production of 375,210 fine oz. during the first quarter of 1943 and 372,988 fine oz. during the second quarter, declined appreciably during the latter part of the year. The total annual production for 1943 amounted to about 1,364,000 fine oz., compared with 3,583,080 fine oz. in 1942. Utah was the leading producer. During the early part of the year, when Homestake Mining Co. was operating under an extension permit, South Dakota was in second place, but during the final half of the year Arizona, California, Colorado, and Nevada shared this honor. CHARLES T. POST.

GOLD COAST. A British colony in West Africa, consisting of the Gold Coast colony (23,937 sq. mi.), Ashanti (24,379 sq. mi.), Northern Territories (30,486 sq. mi.), and Togoland (13,041 sq. mi.). Total area, 91,843 square miles; total population (1940 estimate), 3,962,520, including 3,182 non-Africans. Chief towns (1931 census figures): Accra, the capital (72,977), Kumasi (43,413), Sekondi (21,614), Cape Coast (19,412), Tamale (18,591), Koforidua (13,957). Education (1941– 42): 467 government and assisted schools and 62,-084 students; various schools supported by religious organizations; native administration schools had 818 students.

Production and Trade. The main products are cacao, kola nuts, palm kernels, copra, rubber, maize, yams, timber, gold, manganese, and diamonds. Gold production (1941): 886,000 troy oz. The sea fisheries employ 8,000 canoes and 50,000 men. Trade (1941): imports £8,600,000; exports £12,200,-000. Chief imports: textiles, oils, machinery, tobacco, clothing, iron, and steel manufactures. Shipping (1941): 3,145,018 tons entered and cleared. Communications (1941): 490 miles of railways open for traffic, and 6,610 miles of roads suitable

for motor traffic

Government. Finance (year ended Mar. 31, 1942): revenue £5,541,514; expenditure £5,034,777; public debt £10,400,000. The appropriation for 1933-34 totaled £5,602,000. The Government of the Gold Coast colony is administered by a Governor, assisted by an executive council of official and unofficial members. There is a legislative council for the colony (exclusive of Ashanti and Northern Territories) of 30 members, including the Governor as president. The Governor has power to enact laws for Ashanti, Northern Territories, and Togoland, and their statistics of trade, etc., are included in the general total for the Gold Coast. Governor and Commander in Chief, Sir Alan Burns (appointed Oct. 1, 1941).

History. During the year a grant of £127,000 from the Colonial Development and Welfare funds was authorized for the establishment of a West African Institute of Arts, Industries, and Social Science at Achimota in the Gold Coast. The general aims of the Institute were investigation, teaching and development of local crafts and industries with reference to modern European experience; and investigation of local culture, social structure, and economic conditions, with special reference to problems arising from contact with European civiliza-

## GOLD HOLDINGS. See BANKS AND BANKING.

GOLF. The old game of golf, probably hit harder than any other sport by the rationing of gasoline and tires, and priorities on steel and reclaimed rubber, managed to stagger through a rather lacklustre season in 1943. Were it not for a couple of national tourneys and a little sectional competition the divot-digging pastime would have passed right out of our sports picture. The U.S. Colf Association continued its policy of no tourneys and the Professional Golfers' Association, after struggling through a 1942 campaign, decided to abandon its championship.

The nearest approach to a national open was the

Tam O'Shanter staged by George S. May in Chicago. May, who came into national golf prominence the previous year with his first tournament Tam O'Shanter Club, enjoyed another marked success from the standpoint of entries and attendance with his All-America tourney last July. Honors in the \$10,000 open event were won by Harold (Jug) McSpaden of Philadelphia after a play-off with Orville (Buck) White of Greenwood, Miss. Tied with the Mississippi star at 282. after four rounds, McSpaden took top money when he holed a 20-foot putt on the last green to win the play-off by 71 to 72. The All-America promoted the sale of an estimated \$900,000 in war

bonds and stamps.

Sam Byrd of Philadelphia, the former New York Yankee outfielder, who has come up fast as a golfer, captured the Victory open played at the Beverly C. C. in Chicago. Byrd scored a 277, five strokes fewer than Craig Wood, hold-over national open ruler, who was runner-up. Net proceeds of the Victory tournament were donated to the Wounded Soldiers' Fund. Later, Mr. May paired McSpaden and Byrd in a 36-hole challenge match at the Tam O'Shanter Club and McSpaden

triumphed by eight shots, 141 to 149.

The United States Seniors' Association championship was won by Ellis Knowles, intercollegiate titleholder 'way back in 1907, who set a new record for the 39-year-old competition when he carded a first-round 67, five under par for the famous Apawamis Club course. All entry money in

this tournament was given to the Red Cross.

New York State held three of its title tournaments simultaneously at Lake Placid, with Ray Billows of Poughkeepsie beating Joe Ruszas of Albany to corry off the constant lawels for the first bany to carry off the amateur laurels for the fifth time. Miss Kay Byrne of Rye defeated Miss Margaret Nichols of Yonkers for the women's crown and F. R. Ryan of Roslyn, L. I., annexed the State seniors' title. The New York State junior championship, played at Syracuse, resulted in victory for George Stuhr, Garden City, L. I., high school star. Amateur honors in New Jersey went to Frank Bedford when he defeated the popular Mike Ces-

tone in an extra-hole match.

Miss Patty Berg, who suffered a severe injury in an automobile accident last winter, returned to golf in the summer of 1943 and made a great comeback by winning the women's Western open for the second time in three years. The Minneapolis redhead, now a Second Lieutenant in the Marines, defeated Miss Dorothy Kirby of Atlanta, 1 up, to succeed Miss Betty Jameson as champion. Miss Jameson, now a resident of Mexico City, did not defend the title. The women's Western amateur tournament was won by Miss Dorothy Germaine, 18-year-old Philadelphia playground supervisor, who became the first Easterner to capture the 43year-old event when she defeated Miss Agnes Wall of Menominee, Mich., by the surprising score of

College golfers enjoyed a comparatively good year. Yale won the national championship by a margin of four shots over Michigan, while Walter Ulrich, Carleton College sophomore, annexed the individual title. Michigan carried off the Big Ten team crown and Navy proved best in Eastern inter-

collegiate play.

<sup>\*</sup>Exclusive of army, navy, and merchant seamen abroad.  ${}^{\mathtt{b}}$  Including Monmouthshire.

Live births in England and Wales in 1942 numbered 655,075 (15.8 per 1,000), which was nearly 68,000 more than in 1941 and the highest yearly total registered since 1928. Deaths in the same area, including war deaths, numbered 479,907 (11.6 per 1,000), which was 55,000 less than in 1941 and the lowest of the four war years. The infant mortality rate fell to 49 per 1,000 live births from 59 per 1,000 in 1941. Marriages declined to 368,252 in 1942 but the marriage rate was higher than any recorded for the preceding 89 years except for the war years 1919, 1920, and 1939 to 1941 inclusive. The live birth rate for Scotland in 1942 was 18 per 1,000 (17.9 in 1941); death rate, 12.9 (14.5 in 1941).

Estimated populations of the chief cities in 1939 except as stated, were: Greater London, 8,700,000 (1938); County of London, 4,062,800 (1938); Glasgow, Scotland, 1,131,800 (1940); Birmingham, 1,052,900; Liverpool, 822,400; Manchester, 727,600; Sheffield, 522,000; Leeds, 497,000; Edinburgh, Scotland, 475,500 (1940); Belfast, Northem Ireland, 438,112 (1938); Bristol, 419,200; Hull, 317,800; Bradford, 287,500; Newcastle, 293,-400; Stoke-on-Trent, 265,800; Nottingham, 278,-800; Portsmouth, 260,300; Leicester, 262,900; Croydon, 243,900; Cardiff, Wales, 224,850 (1938); Coventry, 220,000; Plymouth, 215,500.

Education. Enrollment in the 21,678 elementary schools in England and Wales numbered 4,971,357 in 1939, and the total net expenditure of local authorities for elementary education was £74,970,-611 for 1939-40. In Scotland there were 2,899 primary schools with 604,977 enrolled pupils, and the total ordinary expenditure of educational authorities for 1941–42 was about £ 14,817,569. England and Wales had 2,156 secondary schools recognized by the Board of Education as efficient, with 569,089 pupils in 1937–38. Of these schools, 1,398 received grants-in-aid. Total net cost of secondary education in 1939–40 was £23,724,843. In Scotland there were 1,343 schools with secondary divisions, with an average enrollment of 380,970, in 1941. There are 11 universities in England, 4 in Scotland, and 1 in Wales. The combined student enrollment in 1942-43 was 38,806.

In 1939, 94 per cent of all British children were educated in schools wholly or partly maintained by public authorities, and about 42 per cent of all university students were assisted by the state. Needy students in secondary schools also received limited public assistance. The provision of meals and milk to school children was greatly expanded during the war (3,250,000 pupils were receiving milk and about 1,000,000 a meal daily at school in 1942). As a result, a definite improvement in the health of school children was reported by the

President of the Board of Education.

Religion. The Church of England (q.v.), with an Episcopal form of government, and the Church of Scotland (Presbyterian) are the "established religions" in England and Scotland, respectively. Recent statistics of "full members" of leading de-nominations in England and Wales were: Anglican, 2,294,000; Methodist, 1,262,596; Congregational, 494,199; Baptist, 383,373; Calvinistic Methodist, 261,287. The number of Roman Catholics was estimated at 2,361,504 in 1937. The Church of Scotland had 2,522 congregations with 1,278,297 members on Jan 1,1941. There were 1,278,297 members on Jan. 1, 1941. There were 404 Scottish Episcopal churches and missions with 61,547 communicants in 1939, and 450 Roman Catholic churches, chapels, and stations, with 614,-021 adherents in 1937.

Production. Detailed statistics of agricultural, mineral, industrial and other production have been withheld since the outbreak of World War II. For the latest available figures, see 1942 Year Book, p. 244-245. The net national income at factory costs was estimated at £4,490,000,000 for 1938, £5,726,000,000 for 1940, £6,619,000,000 for 1941, and £7,384,000,000 for 1942. War expenditures rose from 15 per cent of the national income in 1938 to about 71 per cent in 1942. This transition was accompanied by the far-reaching reorganization of the national economy on a war basis. (see preceding Year Books and *History* below).

In 1938 the United Kingdom, with 12,957,000

acres under cultivation, produced some 40 per cent of its own food requirements. By 1943 the area available for cultivation decreased 2 per cent as a result of expanded industrial and military establishments, but the area under actual cultivation increased 53 per cent to over 18,000,000 acres, which supplied about 70 per cent of the food required. As compared with 1938 yields, the 1943 crops of wheat, barley, oats, rye, and mixed grains

increased by 65 per cent, potatoes more than 80 per cent, vegetables 55 per cent. While the cattle population increased, the number of pigs declined 51 per cent, sheep 18 per cent, and poultry 20

The diversion of industry from peacetime to war production was virtually completed during 1943. The Minister of Supply reported that output of munitions and war supplies in the first quarter of 1943 was 40 per cent greater than for the first quarter of 1942. The concentration of consumergoods industries, begun in March, 1941, to release labor and factory space for war purposes, permitted a reallocation of about 250,000 workers and 187 million square feet of factory and storage space, up to Feb. 16, 1943. The estimated output of coal in 1941 was 208,800,000 metric tons (230,658,000 in 1938). See History.

Foreign Trade. Imports in 1940 were valued at £1,099,869,000 (£885,513,000 in 1939); exports of British products, £413,084,000 (£439,-536,000 in 1939). Of the 1940 imports, food, drink, and tobacco accounted for £421,004,000; raw and semi-manufactured materials, £336,495,-000; manufactured articles, £336,209,000. Of the exports of British produce, £33,352,000 represented food, drink, and tobacco, £36,292,000 raw and semi-manufactured materials, and £335,960,-000 manufactured articles. For the latest available data on the distribution of British trade, see YEAR BOOK for 1938, p. 328. For trade with U.S. in 1941 and 1942, see Trade, Foreign.

Finance. Closed financial accounts for the fiscal

years ending March 31 are shown in the accompanying table.

UNITED KINGDOM: BUDGET OPERATIONS. (In millions of pounds)

| Year      | Receipts | Total<br>Expendi-<br>tures | War<br>Expendi-<br>tures | Deficit |

<sup>a</sup> Excluding lend-lease and in 1943–44 Canadian-British mutual aid, but including in 1942–43 a Canadian financial contribution to the British Treasury of £224,700,000. <sup>b</sup> Estimates.

The public debt rose from £8,163,000,000 at the outbreak of the war to £17,732,000,000 on June 30, 1943. On the latter date the internal debt was £16,440,000,000 (consolidated, £12,187,-000,000; floating, £4,253,000,000) and the external debt £1,292,000,000 (at par). The British Exchequer's wartime advances to allied governments up to June 30, 1943, totaled £195,000,-000, exclusive of British lend-lease aid to those governments. The average free exchange rate of the pound sterling was \$4.8894 in 1938, \$4.4354 in 1939, \$3.83 in 1940, \$4.032 in 1941, \$4.035

Shipping. On June 30, 1939, the British merchant fleet aggregated 21,001,925 gross tons. New construction and acquisition of fleets from countries overrun by Germany offset war losses up to Nov. 1, 1940, when the total shipping available to the British was placed at 21,000,000 tons. Between June, 1941, and September, 1943, a total of 238 German, Italian, and Finnish ships aggregating 1,279,400 tons were seized and added to the British merchant navy. In addition 203 Danish ships were requisitioned. For British shipping losses, see Shipping.

Railways, etc. There were 20,162 miles of railway

line open in Great Britain on Jan. 1, 1939 (51,-000 miles of track). After the war began, management of all lines was pooled under a committee of railway executives responsible to the Ministry of War Transport. In 1942 it was estimated that the transport of troops, coal, and war materials accounted for 60 per cent of all railway traffic. Roads and highways in the United Kingdom totaled 180,-527 miles in 1940. The total length of British home and overseas civil air routes was 30,624 miles in August, 1939. Twice-a-week service between London and Lisbon, Portugal, was started on June 4, 1940. A North Atlantic air ferry and supply route was inaugurated via Botwood, Newfoundland, in 1941. British Overseas Airways flying boats and landplanes flew about 10,000,000 miles in 1942, carrying approximately 43,000 passengers, 850 tons of mail, and 2,250 tons of freight. The capacity ton-miles provided increased from 8,674,972 in 1940 to about 21,600,000 in 1942.

Government. The United Kingdom of Great Britain and Northern Ireland is a limited monarchy with an unwritten constitution, under which final legislative, judicial, and administrative authority is vested in a Parliament of two houses, acting through a cabinet drawn from its members. The House of Commons consists of 615 members, elected by universal male and female suffrage on the basis of one member for every 70,000 of population. The House of Lords in 1943 had 795 members, including 32 minors not seated, who are variously selected—by heredity, appointment, by

virtue of office, and by election.

The standing of the Government parties in the House of Commons in 1943 was as follows (names of leaders in parentheses): Conservatives (Winston Churchill), 366; Labor (Clement R. Attlee), 168; Liberal National party (Viscount Simon), 27; Liberals (Sir Archibald Sinclair), 18; National Labor party (Malcolm MacDonald), 6; Nationals, 4; total 589. The Opposition consisted of 22 Independents, 3 Independent Laborites (leader, James

Maxton), and 1 Communist.

The last general election was held in November, 1935. The election due in 1940 was postponed for one year through an agreement reached by the principal political parties on Sept. 22, 1939, which was prolonged each succeeding year of the war. On May 12, 1940, Winston Churchill replaced Neville Chamberlain as Prime Minister and a National Government was formed, including the Labor and Liberal opposition. There were successive reorganizations of the Churchill Government. On Sept. 3, 1939, Prime Minister Chamberlain replaced the Cabinet of 22 members with a War Cabinet of 9 members (later 8), who assumed responsibility for coordinating the nation's war effort. The other Ministers (heads of Government departments) no longer retained Cabinet rank. The War Cabinet was assisted by committees of Ministers, usually acting under the direction of a Cabinet member.

Members of the War Cabinet at the beginning of 1943 were: Prime Minister, First Lord of the Treasury, Minister of Defense, Winston Churchill; Dominions and Deputy Prime Minister, Clement R. Attlee; Foreign Affairs and Leader of the House of Commons, Anthony Eden; Home Secretary and Minister of Home Security, Herbert Morrison; Lord President of the Council, Sir John Anderson; Production, Oliver Lyttelton; Labor and National Service, Ernest Bevin; Minister of State (charged with coordination of the Empire's war effort in the Middle East), Richard G. Casey of Australia, with headquarters in Cairo. For changes during 1943, see *History* under Cabinet Changes.

HISTORY

Road to Victory. The Battle of El Alamein and the Anglo-American landings in French North Africa in the late autumn of 1942 started Britain on the road to victory after more than three years of failure, defeat, and dire peril. During 1943 the road broadened and the pace quickened. Defeat of the German military colossus was brought within measurable distance by a series of Allied hammer blows. To these the British people, under their superb war leader, Prime Minister Winston Churchill, contributed their full share.

British forces bore the major burden of the

British forces bore the major burden of the fighting in Tunisia, Sicily, and the Italian main-land that toppled Mussolini's Fascist regime, knocked Italy out of the Axis war coalition, and opened the Mediterranean to Allied shipping. Anglo-American naval-air forces, with Canadian help, decisively crushed the German submarine menace, which Churchill in 1942 had declared the

major obstacle to victory.

Meanwhile the R.A.F.'s powerful bombing fleets spread devastation far and wide among German cities and industrial centers, causing a marked slump in Germany's home-front morale. While serving as an unsinkable aircraft carrier anchored off the coast of Axis Europe, the island of Britain was steadily developed into a powerful and well-equipped base for the impending land invasion of Hitler's "European fortress." Successive great convoys landed contingent after contingent of American and Canadian troops and huge quantities of supplies to strengthen the Allied invasion army previously built up in the British Isles.

These grand preparations were facilitated by the steadily declining force and frequency of German air raids. With the danger of attack and invasion waning, it was announced on June 30 that Britain's civil-defense forces had been reduced by one-third during the preceding year and that another cut of one-sixth was planned. Yet sporadic attacks by fast German fighter-bombers on English cities and towns occasionally caused serious damage and casualties. An air raid alarm on the night of March 3 produced tragedy in one London shelter. As a crowd poured down the steep and dimly-lighted steps, a woman slipped and fell, causing a jam in which 178 persons were killed

and 60 injured.

Even more important than the sensational change in Britain's military position were the great gains registered by Prime Minister Churchill and Foreign Minister Eden in the diplomatic field. The close Anglo-American collaboration established in previous years was extended by a series of military-political conferences and discussions—at Casablanca, Washington, and Quebec. Then the Soviet Union and China were for the first time brought into intimate cooperation with the Anglo-American powers by the four-power conferences at Moscow, Cairo, and Tehran (see United Nations). In the words of President Roosevelt, the latter conferences forged the United Nations into "a single sword... wielded as if by a single brain and a single hand." Temporarily, at least, they had banished danger of a breach between the Soviet Union and the Anglo-American powers, which remained the greatest single threat to a complete United Nations victory.

War Problems and Negotiations. This significant progress was achieved in the face of formidable obstacles. Divergent national interests and deeproted suspicions tended to divide the four chief military powers of the United Nations' coalition. As the Axis menace waned and the collapse of Nazi

Germany loomed nearer on the European horizon, the divisive tendencies within the United Nations

gained headway.

Friction in North Africa. The first such clash arose late in 1942 over the policy of collaboration with the Giraud administration in French North Africa, adopted by General Eisenhower as commander-inchief of the Anglo-American forces in that area. This policy, while inspired by military considerations, was much more in line with the State Department's French policy than with the pro-de Gaullist course followed by the British Government since June, 1940. It aroused deep misgivings and bitter criticism in Britain. The delays and early setbacks in the Tunisian campaign added to British disquiet and gave rise to reports of a serious quarrel between Washington and London

over Allied policy in North Africa.

British officials took prompt steps to end the rising tension. On January 14 Minister of Informa-tion Brendan Bracken declared that "the British Government has given General Eisenhower the power of attorney and will support him unquestioningly, whatever he does." When the House of Commons reconvened January 19 after a long recess, Deputy Prime Minister Clement Attlee affirmed the Government's faith in Eisenhower's military leadership. Politically, he declared, Britain and the United States had "a single objective, which is to promote the union of all Frenchmen in the war against the Axis for the liberation of

Casablanca Conference. One of the four major aims of the 10-day conference held by Churchill, Roosevelt, and their combined staffs at Casablanca late in January was to unite de Gaulle, Giraud, and their supporters in a single French liberation movement. For reasons explained elsewhere (see France under History), this initiative failed at the outset. But under constant Anglo-American prodding, the French factions were finally united in the French Committee for National Liberation on June 3. The formation of this committee visibly strengthened the anti-Axis coalition. However the emergence of de Gaulle as the dominant figure in French affairs and his outspoken opposition to Anglo-American policies created new difficulties, which had not been overcome at the year's end. In dealing with de Gaulle and other French affairs, the British and American Governments after Casablanca displayed close accord.

Before returning to London from Casablanca, Prime Minister Churchill made a flying visit to Tripoli, Libya, to review the victorious Eighth Army and to Turkey (q.v.) for conferences with President Inonu. On February 12 he made one of his memorable speeches before the House of Commons, summarizing the results of the Casablanca conference. Britain and America, he said, "have now a complete plan of action which comprises apportionment of forces as well as their direction, and this plan we are going to carry out . . during the next nine months, before the end of which we (Churchill and Roosevelt) will make efforts to meet again." He revealed that, while he spoke, Lieut. Gen. Henry Arnold, head of the U.S. Army Air Forces, and Field Marshal Sir John Dill, head of the British Lieut Staff Marshal Sir John Dill, head of the British Joint Staff Mission in Washington, were "in Chungking concerting what we have in mind with the Chinese Generalissimo."

Discussions in Washington. One month later (March 12) Foreign Secretary Eden arrived in Washington for "a general exchange of views with the United States Government on all aspects of the war situation, and to discuss the most effective

method of preparing for meetings between the governments of all United Nations to consider questions arising out of the war." The outcome of discussions was not revealed, but it was indicated that before returning to London on April 4 Eden did much to reconcile American and Soviet view-

points on war and postwar issues.

While Eden was in America, Churchill in a broadcast on foreign and domestic policy on March 21 stressed the necessity of including Russia in the creation of a postwar world order. Mutual concessions, he said, were necessary to reach agreements among the great powers and no one nation could expect to achieve the full satisfaction of its individual wishes. His failure to list China among the great powers was remedied by Eden in a subsequent address before the Maryland General Assembly.

The approaching conclusion of the Tunisian campaign sent the Prime Minister to Washington early in May with a large staff of military and naval experts to map out the next moves to achieve the goal of "unconditional surrender" by the Axis powers announced at Casablanca. Churchill arrived in Washington for his fifth war conference with Roosevelt on May 11 and did not return to London until June 5. On May 19, in his second address before a joint session of the U.S. Congress, he presented a masterly survey of the progress achieved since his first wartime visit to Washing-

ton in December, 1941.

The main points of this speech were: (1) a pledge that Britain would wage war to the end against Japan "side by side with you in accordance with the best strategic employment of our forces," (2) his statement that the "experiment" of trying to bring about the collapse of Germany and Italy by the use of airpower by itself was "well worth trying, so long as other measures are not excluded," (3) an expression of hope that he and Roosevelt would soon "achieve what we have so long sought—namely, a meeting with Marshal Stalin and if possible with Generalissimo Chiang Kai-shek," and (4) his declaration that "we must do everything that is sensible and practicable to take more of the weight off Russia in 1943."

On his way home from Washington, the Prime Minister detoured by way of North Africa to convey to Allied commanders there the decisions taken at Washington. He was accompanied by Gen. George C. Marshall, Chief of Staff of the U.S. Army. Rendering account of his Washington trip to the House of Commons on June 8, he declared that "amphibious operations of a peculiar complexity and hazard on a large scale are approaching." While the Allied armies in North Africa rested and prepared for the invasion of Sicily, King George visited the British forces in North Africa and Malta during the latter half of June.

Mediterranean Problems. The successful invasion of

Sicily in July precipitated the downfall of Musso-lini on July 25 and the capitulation of the Badoglio Government to the Allies early in September. Then came the attack upon the Italian mainland, the alignment of the Badoglio Government with the United Nations against Germany, the French reoccupation of Corsica, and the beginning of Allied air attacks from Italy upon German bases in the Balkan peninsula.

These developments raised urgent new problems for the Churchill Government both at home and abroad. There was strong criticism in the British Parliament and press of the arrangements made with Badoglio. De Gaulle protested the exclusion of the French Committee of National Liberation from the peace negotiations with Italy. Moscow, by a series of diplomatic moves at variance with Anglo-American policies, indicated dis-satisfaction with the attention given Russian interests in the Balkans and the Mediterranean area. Moscow also applied increased pressure for the opening of another front in Western Europe. The British, who had long supported the Greek and Yugoslav Governments-in-Exile, were confronted with the necessity for immediate clarification of policy with respect to the Balkan states.

Foreign Secretary Eden replied to attacks upon

the Government's Italian policy in the House of Commons August 3. The whole purpose of the Government, he said, was to obtain Italy's unconditional surrender "so that we can turn the war even more vigorously to Germany." He declared the Allies would be "only too ready" to adopt a "reasonable attitude" toward Italy if they got what they wanted for proceeding the war against what they wanted for prosecuting the war against the Reich. The subsequent agreements concluded with Badoglio and the role of the Allied Military Government (see ITALY under History) aroused further criticism in Britain. Government spokesmen gave assurances that the Allies had given no secret commitments to Badoglio and King Emmanuel, that conclusion of the armistice with them did not imply recognition, and that the decision as to the future government of Italy would be left to the Italian people.

Quebec Conference. The impending elimination of Italy from the war and the progress of the Russian summer offensive sent Churchill overseas again in August for further discussions and conferences at Hyde Park, Quebec, and Washington (see UNITED Nations under The Quebec Conference). Lord Louis Mountbatten was appointed head of a new Southeast Asia Command (see WORLD WAR, map) to direct the intensified warfare against Japan made possible in that area by the opening of the Mediterranean to Allied shipping and the release of strong units of the British fleet that had been on guard against the Italian navy. Agreement was reached on limited recognition of the French Committee of National Liberation (see France under

Immediately after conferring with Churchill and Roosevelt at Quebec, Foreign Secretary Eden returned to London for a series of discussions with the Soviet and American ambassadors that paved the way for the conference of the "big three" Foreign Ministers in Moscow and for the Cairo and Tehran conferences. Meanwhile Churchill in a radio broadcast from Quebec on August 31 publicly invited the Soviet Government to join in these "necessary and urgent" conferences. He said Britain and the United States would be "very glad to associate Russian representatives with us in the political decisions which arise out of the victories the Anglo-American forces have gained in the Mediterranean.

The necessity for continued Anglo-American cooperation as the basis of any larger system of world security was the burden of an address delivered by Prime Minister Churchill at Harvard University on September 6. "If we are together nothing is impossible," he said. "If we are divided all will fail." His insistence that the "immensely powerful" Anglo-American machinery of collaboration must be kept "working and in running order" after the war was endorsed by high Washington officials

the following day.

After further conferences in Washington, Churchill returned to London on September 19. On the 21st he gave the Commons a lengthy review of recent war developments, which largely dissipated a rising tide of criticism of Allied military and political strategy in Italy. He declared that Italy's African empire was "irretrievably lost," that the Allies had definitely gained the upper hand over Germany at sea and in the air, and that "the bloodiest portion of this war for Britain and the United States lies ahead of us."

Cooperation with Russia. In line with the decisions taken at Quebec, Russia was consulted by the British and American authorities entrusted with peace negotiations with Italy, and a Soviet plenipotentiary was invited to participate in the signing of the armistice convention. Moscow, however, empowered General Eisenhower to sign in its behalf. Russia was also invited to become a member of the Mediterranean Commission, which the Quebec conferees agreed to create for the solution of political problems in that area. A great increase in war and food shipments to Russia from Britain, the United States, and Canada was provided for in a new lend-lease agreement signed by the four powers in London October 18. (In addition to arms and munitions, the British Government sent £70,000,000 worth of supplies to Russia between

June, 1941, and December, 1943.

These preliminary moves paved the way for the important decisions of the Moscow Conference (see United Nations). As Foreign Secretary Eden stated on November 11 following his return from Moscow, these agreements placed the responsibility for winning the war and ensuring "lasting peace" directly upon Britain, Russia, and the United States. The military and political decisions for carrying this program into effect were taken at the Tehran Conference, after China had been brought into the circle of the great Allied powers by the decisions taken in Cairo. Reporting to the House of Commons on these conferences on De-cember 14-15, Eden declared that "the military plans which we laid down at Tehran call for all our Allied resources in every respect." He said the timing of the Allied invasion of Western Europe and other military operations had been agreed on and "in due course the decisions... will be unrolled on the field of battle." He gave assurances that no secret agreements had been made at Tehran and that none would be made as long as he was Foreign Minister. The appointment of General Eisenhower to direct the Anglo-American invasion of Axis Europe from the British Isles followed on December 24.

Meanwhile the Advisory Council for Italy authorized at Moscow was established, comprising American, British, Russian, and French representa-tives and with Greek and Yugoslav representation promised. The European Advisory Commission decided upon at Moscow was set up in London December 15. Composed of the U.S. and Soviet Ambassadors and Sir William Strang of Britain, it was empowered to "recommend" joint policies on common European political problems. Many such problems remained to be solved, particularly the question of boundaries in Eastern and Central Europe and the conditions under which Allied military commanders would turn over the political administration of occupied territories to national

authorities.

Other Foreign Relations. At the conclusion of the Tehran Conference, Churchill and President Roosevelt returned to Cairo for further important conferences with the President of Turkey, with leaders of the Greek and Yugoslav Governments-in-Exile, and with various other officials concerned with other Middle Eastern problems. Turkey was

brought into still closer collaboration with the United Nations. New efforts were made to heal the breach in Yugoslavia between the pro-Communist Partisans and the forces of Gen. Draja Mikhailovitch, and to end the somewhat similar civil strife in Greece. Anglo-American material support had been given increasingly to the Yugoslav Partisans after the Allied landings in Italy. Explaining British policy in the Balkans before the House of Commons in mid-December, Foreign Secretary Eden said it was guided by three principles: (1) extension of all practical aid to those elements actively fighting the common enemy, (2) use of Allied authority to assure Greece, Yugoslavia, and other enemy-occupied countries of freedom to choose their own governments after liberation, and (3) the closest possible concert with Britain's allies.

The British, with American support, also pressed the French Committee of National Liberation to fulfill the pledge of independence given to Syria and Lebanon in 1941. An Anglo-American policy was reported to have been adopted, though not announced up to the year's end, on the thorny question of Arab-Jewish claims in Palestine. Another acute problem, that of Anglo-Soviet relations in and with Iran, had been temporarily disposed of by a special declaration of the Tehran Confer-

ence.

Anglo-American policy toward France,. Italy, and Yugoslavia and the subsequent Anglo-American-Soviet agreements aroused apprehension among the governments-in-exile of the smaller European powers under German occupation. They opposed plans for establishing the Allied Military Government in newly liberated territories pending determination of the popular will. Some feared that their national interests and freedom of action would be sacrificed or restricted in behalf of Anglo-Soviet collaboration. At the same time the internal and external quarrels of the governments-in-exile greatly obstructed British diplomacy in its effort to promote permanent unity and solidarity among the United Nations.

The Foreign Office strove incessantly to mend the dangerous rift between the Soviet and Polish Governments that took place in April, but without success up to the end of 1943. Largely because of this delicate problem, Britain delayed as long as possible the conclusion of the Soviet-Czechoslovak mutual assistance pact which was signed in December. Foreign Secretary Eden met with the Foreign Ministers of the exiled governments on September 1 to inform them of the discussions and decisions taken at Quebec. On the eve of his departure for the Moscow Conference, he called together the Foreign Ministers of Norway, Czechoslovakia, the Netherlands, Poland, and Belgium to assure them that the great powers would seek a general European settlement on the basis of "joint responsibility" instead of attempting to divide Europe into "spheres of influence."

Despite growing pressure from some of the exiled governments and from a section of unofficial opinion in the United States, the British Government in May and again in November rejected proposals for relaxing the blockade of Europe to permit the sending of foodstuffs to the German-occupied countries. An exception, however, was made in the case of Greece. "We know by experience that the Germans would not hesitate to create more starvation and shortages if such a program were followed now," a spokesman for the Ministry of Economic Warfare explained on November 10.

The steady improvement of British and Allied

military fortunes was reflected in the action of Portugal, announced October 12, in authorizing the British Government to use naval and air base facilities in the Azores for anti-submarine patrols. It was further indicated by the less conciliatory attitude displayed in London toward the Franco Government in Spain. See each of the countries mentioned above under *History*.

Empire Affairs. As the war drew toward its close, the problem of adjustment to new world conditions produced active ferment in the British Empire. On November 25 Prime Minister Jan C. Smuts of the Union of South Africa proposed that Britain should remedy her unequal partnership with Russia and the United States by establishing close ties with the democracies of Western Europe. In a widely discussed speech delivered at Adelaide August 14, Prime Minister Curtin of Australia proposed that the foreign and defense policies of the empire should be withdrawn from the separate Commonwealth governments and parliaments and concentrated in a single imperial executive agency. Australian leaders also proposed a permanent consultative council of the United Nations chiefly interested in the Pacific to prevent a repetition of Japanese or other aggression. In the Canadian House of Commons on July 9 spokesmen of the Progressive Conservative party and Cooperative Commonwealth Federation recommended Canada's entry into the Pan American Union.

There was a growing agitation for the amalgamation of Southern Rhodesia and other British territories in South Africa with the Union of South Africa. South-West Africa was also reported to be seeking to throw off the League of Nations mandate in favor of incorporation in the Union of South Africa. Prime Minister Smuts of the Union of South Africa proposed that the future development of British colonies be entrusted to regional Commonwealth councils representative of Britain and the Dominions with interests in the area. British and Commonwealth political and economic relations with the United States, Russia, and the projected postwar world order were also under active discussion in Britain and each of the Dominions. Prime Minister Churchill told the House of Commons September 22 that he had been trying for two years to arrange a meeting of all the Prime Ministers of the Empire to discuss these and related issues. He expressed hope that such a meeting would take place early in 1944.

The future of Newfoundland, British postwar relations with Belgium and the other small democracies of western Europe, British policy toward India, and colonial reform were other urgent problems awaiting solutions. The deadlock between the British Government and the All-India National Congress persisted throughout 1943. But the appointment of Field Marshal Viscount Wavell as Viceroy on June 18 and of Richard Gardiner Casey as Governor of Bengal on December 24 aroused some hope of clarification of Anglo-Indian relations. Meanwhile there was strong criticism in Britain of the Government's failure to grapple more effectively with famine conditions in India.

Colonici Reform. Concrete steps were taken during the year to speed up the advance toward self-government within the empire on the part of the British crown colonies and other colonial dependencies. Col. Oliver Stanley, the Colonial Secretary, said on March 5 that "the administration of the British colonies must continue to be the sole responsibility of Great Britain" but that this did not exclude the possibility of "close international cooperation" in promoting colonial development. On

March 17 Prime Minister Churchill declared in the House of Commons that Colonel Stanley spoke for the Government in rejecting unofficial American suggestions for international administration of British colonies. "The policy of the Government," said Churchill, "is to play for the fullest possible political, economic, and social development of the colonies within the British Empire, and in close cooperation with neighboring and friendly nations."

Elaborating on the Government's colonial reform program before the House of Commons July 13, Colonel Stanley announced that Britain favored the establishment of regional colonial commissions to facilitate the cooperative solution of problems common to distinctive colonial areas. He said Britain would welcome the collaboration of other states with colonial possessions in the same regions and with other powers having a "major strategic or economic interest" there.

Meanwhile the Colonial Ministry took a series of steps calculated to strengthen the political, economic, and social foundations for colonial self-government. A more liberal constitution was offered to Jamaica, and further constitutional reform was promised Ceylon, Malta, and Cyprus after the war. The appointment in December of Prof. Noel Hall, well-known economist, as development adviser for the West African colonies was one of several important measures initiated in 1943 for the long-range economic development of the colonies. For a more detailed account, see Ronald Stuart Kain, "Britain's New Colonial Policy," Yale Review, March, 1943.

Internal Politics. Despite fairly widespread dissatisfaction with the Churchill Government's slow pace in preparing for postwar reconstruction, the electoral truce adopted by the major parties in May, 1940, was extended for another year on October 26 when Parliament voted itself another year of life. The Prime Minister defended the electoral truce on April 15 as essential to national unity in prosecuting the war. His view was endorsed by the Labor party's convention in London in mid-June, 2,243,000 to 374,000, and by the Liberal party's convention in mid-July. As a result of this agreement among the three chief parties of the national coalition, the House of Commons entered upon its ninth year of life, the longest period served by any Parliament since 1679.

Cabinet Changes. Prime Minister Churchill reshuffled his Cabinet several times during the year without upsetting materially the party balance or unity of the Government. On February 8 Herbert Morrison, Home Secretary and Minister of Home Security, was named to the additional post of Minister of Town and Country Planning. Following the death of Sir Kingsley Wood, the Chancellor of the Exchequer, Churchill on September 24 transferred Sir John Anderson to the vacant Treasury post; named Maj. Clement R. Attlee, Labor party leader and Deputy Prime Minister, to succeed Sir John as Lord President of the Council while retaining his other posts; appointed Viscount Cranborne, former Lord Privy Seal, as Secretary of State for Dominion Affairs; brought Lord Beaverbrook back into the Cabinet as Lord Privy Seal; and created the new post of Minister of State in the Foreign Office for Richard K. Law, son of former Prime Minister Andrew Bonar Law. As Lord Privy Seal, Lord Beaverbrook assumed charge of postwar civil aviation problems for the Government. Major Attlee took over the chairmanship of the important Cabinet Home Affairs Committee, and Sir John Anderson was delegated to work with financial and economic experts on postwar problems.

Beveridge Plan Debate. The major criticism directed at the Churchill Government on internal issues arose from its refusal to place Sir William Beveridge's social security plan in effect immediately (see 1943 Year Book, p. 560, for the Beveridge plan). The Prime Minister had the backing of the Labor members of his Cabinet in insisting that the scheme required the prior organization of economic life to provide the wealth needed to meet the projected social insurance claims. Dissatisfaction with this attitude was so widespread that it threatened the continuance of the political truce. The Prime Minister moved to head off this agitation in a radio address of March 21 in which he proposed a broad and liberal four-year program of postwar social and economic reconstruction.

This shrewd move enabled the Prime Minister to postpone action on the social security problem until late in the year. When the tide of criticism began to rise again, he announced a further reshuffling of the Cabinet on November 11, in which Lord Woolton, the popular Minister of Food, was named to the newly created post of Minister of Recon-struction, with a place in the War Cabinet. Col. J. J. Llewellin, Minister Resident for Supply in Washington, replaced Lord Woolton as Food Min-ister. At the same time H. U. Willink, another Conservative back-bencher, became Minister of Health in place of Ernest Brown, who was shifted to the Chancellorship of the Duchy of Lancaster. Ben Smith, a Laborite, succeeded to Colonel Llewellin's former Washington post. Alfred Duff Cooper, retiring Chancellor of the Duchy of Lancaster, was later named Minister to the French Committee for National Liberation. One further change in the War Cabinet occurred December 24 when Richard Gardiner Casey, an Australian appointed in 1942 as British Minister of State in the Middle East, was appointed Governor of Bengal.

Churchill's Popularity. In February and again in December Prime Minister Churchill was incapacitated for some weeks by attacks of pneumonia. His second illness, which followed the trying Cairo and Tehran Conferences, caused much alarm, but he recovered rapidly to the great relief of the British people and of other United Nations. The success of Churchill's war leadership was reflected in a public opinion poll taken just before Italy's surrender showing 93 per cent of those queried as approving of him as Prime Minister; 81 per cent expressed themselves as satisfied with the Government's conduct of the war. The death of Capt. Edward A. Fitzroy, Speaker of the House of Commons, on March 3, led to the election of Col. Douglas Clifton Brown (Conservative) to that post on March 9.

Party Policies. Conservative party leaders, from Churchill on down, took an active part in adjusting British home and foreign policies to the necessities of a revolutionary age. Among the Conservative rank and file there was sharp division over the role of the state in the postwar economic order with younger members showing strong sentiment for a growing measure of government participation and control. The Liberal party, at its July convention, voted overwhelmingly to refuse participation in the existing national government after the war.

The annual Labor party convention in June showed a similar inclination to withdraw from the coalition government after the war. Delegates rebuked Herbert Morrison for his policies as Home Minister by electing his rival, Arthur Greenwood, to the key post of party treasurer. A resolution passed by the convention condemned all Germans for the Reich's war crimes and aggressions. How-

ever the closely related Trades Union Congress at its convention in September blamed the Nazis rather than Germans as a whole. Both the Labor party and TUC, while moving farther to the left in their political and economic programs, again rejected proposals for affiliation with the British Communist party and with the Soviet trade unions re-

spectively. Also see Socialism.

The British Communist party, at its convention early in July, dropped its Bolshevist terminology and revised its rules to conform to the dissolution of the Communist International. But it adhered to the Stalinist party line, demanding the opening of a second front in 1943, abandonment of the elec-toral truce, freeing of the imprisoned All-India Congress leaders, full collaboration with the Soviet Union, support of a democratic anti-fascist movement in Italy, and full recognition of the French Committee of National Liberation. It was announced November 7 that Acting Capt. O. L. Uren of the British Army had been cashiered and sentenced to seven years' imprisonment by court-martial upon his admission that he had revealed highly secret official information to Douglas F. Springhall, national organizer of the Communist party. Springhall was sentenced to a seven-year term under the

Official Secrets Act in July.

The new Common Wealth party, organized under the leadership of Sir Richard T. D. Acland in 1942, elected its first candidate for Parliament in an April by-election. It polled an unexpectedly heavy vote in other electoral tests. In a revolutionary manifesto issued July 7, it called upon the British people to "reject the past and begin now to build a new social order," based on common ownership of all lands, credit and investment institutions, public utilities, mines, factories, and large-

scale commercial enterprises

Fascists Released. The tiny British Fascist movement, leaders of which had been interned without trial when German invasion threatened in 1940, became a source of serious controversy during 1943. Some of its members arranged a public meeting in the Stoll Theater, London, for February 21. Home Security Minister Morrison refused demands that he ban the meeting. London anti-Fascists then called an opposition rally in front of the theater, the management of which cancelled the Fascists' meeting. Speakers at the other rally demanded the

banning of all Fascist activities.

A storm of indignation arose in leftist circles when the Home Ministry released John Becket, interned Fascist leader, on October 30 and Sir Oswald and Lady Diana Mosley on November 20. Sir Oswald, founder of the British Union of Fascists, was freed on the ground of ill health. The general council of the Trades Union Council and the Labor party's national executive both condemned the Home Minister's action, but the Parliamentary Labor group voted 51 to 43 to sustain his decision. The issue was finally taken to the House of Commons which rejected 327 to 62 an amendment expressing regret at Mosley's release. Morrison pointed out that Mosley and the other interned Fascists had committed no crime under British law and had not been indicted, that Mosley was no longer a threat to the national safety, that continued imprisonment might lead to his death, and that he remained in effect under "house arrest" in a private home. Demonstrations against Mosley's release continued. Nevertheless the Home Minister on December 4 released another pro-Nazi political prisoner, C. E. Carroll, former editor of the Anglo-German Review.

A London court imposed a life sentence April 6

on W. F. Craven, former member of the British Union of Fascists, who was convicted of offering his services to the Reich in a letter addressed to

the German Legation in Dublin.

Mobilization for War. Despite these relatively minor political controversies, the Government continued mobilization of the British people for total war with a thoroughness unequaled in any other country with the possible exception of Russia. Although two out of every three persons between the ages of 14 and 65 were either in the armed services or engaged in essential war work. Labor Minister Bevin proceeded to register women up to 50 years of age and boys and girls of 16 and 17 years of age for drafting into essential war work. On July 29 he announced that no further conscripts or volunteers would be accepted by the women's auxiliary armed services in order to free more womanpower for aircraft and munitions factories.

On September 23 Bevin told the House of Commons that more than a million men and women over 65 years of age were working full time in war industries; that over 2,500,000 women previously not engaged in manual or industrial labor had been recruited for the armed services and war plants; and that from Dec. 31, 1942, to September 23 the labor force engaged in war production had been increased by some 2,250,000 workers. He said he had to find about 700,000 additional workers dur-

ing 1943-44.

Regulations authorizing the drafting of women into hospitals, schools, and institutions as cooks, maids, and cleaning women were announced by the Minister of Labor November 4. The shortage of such help was hampering the country's medical and school services. In line with the Ministry's consistent policy of providing the greatest possible safeguards for conscripted labor, Bevin at the same time promulgated Britain's first "charter" for domestic servants in such institutions. They were guaranteed minimum wages, holidays with pay, sickness benefits, and a 48-hour week.

Production Increases. The results of total mobiliza-

tion for war showed in a 25-per-cent increase of production for the second quarter of 1943 as compared with the same quarter of 1942; according to Production Minister Lyttelton, aircraft output alone showed a 44-per-cent increase in structural weight. In a broadcast on July 4, Lyttelton said the British Commonwealth's war production exceeded that of Germany, Austria, and Czechoslovakia combined.

Growth of Strikes. Despite governmental appeals for a united national war effort to carry the United Nations to victory in Western Europe in 1944, there was a marked increase in strikes and labor unrest during the latter half of 1943. This unrest was attributed partly to war weariness and partly to dis-content with the Government's plans for postwar reconstruction. There were 200 strikes in progress in September—a record for the war years. Of particular gravity were strikes in the aircraft industry and the coal mines. A strike involving some 9,000 workers in the important Vickers-Armstrong engineering factory at Barrow began September 17 and was not settled until October 4.

The Coal Problem. State control of coal production, higher wages for miners, and a coal rationing system had been introduced in 1942 (see 1943 YEAR BOOK, p. 291). Nevertheless strikes, slow-downs, and absenteeism among coal miners continued. On May 24 Prime Minister Churchill sent a special appeal from Washington to all coal miners to increase their output. But production for the four weeks ending August 7 was the lowest in two years, the average weekly output being 241,500

tons less than for the same period in 1942. On August 23 the Government authorized men of all ages called up for military duty to choose between

the armed services and the coal mines.

The Government's decision to conscript workers for the pits struck a snag in mid-September when some 23,000 Nottinghamshire miners struck following the imprisonment of an 18-year-old surface worker who refused to take a job underground. The strike forced the release of the youth, but strikes continued to flare in the coal mines. Declining coal production and increased demand led the Minister of Fuel on October 28 to curtail still further the scanty coal rations provided for in 1942. Forced to take more drastic action to bolster production, the Government on November 30 announced the release of many British miners from the armed services to work in the mines. On December 2 Labor Minister Bevin announced in the House of Commons that beginning in January men between 17 and 25 years of age would be conscripted for work in the mines on the same basis as for military service. Meanwhile the Churchill Government had rejected demands made in Parliament for full nationalization of the coal industry.

Postwar Planning. After being brought back into the Cabinet as Lord Privy Seal, Lord Beaverbrook conferred with representatives of the Dominions, India, Newfoundland, Southern Rhodesia, and Burma in London on October 11-13 on the empire's postwar civil air policy. He announced that the conferees has reached unanimous agreement on recommendations and that if these were approved by the Dominion Governments the way would be open for an attempt to coordinate British and United States air policies. However a number of the Dominions withheld action on these recommendations pending

clarification of U.S. policy.

A Government White Paper issued February 25 set forth plans for a 12-year postwar building and town-planning program to provide employment for 1,250,000 men. Adoption of a permanent military conscription program after the war was proposed by Prime Minister Churchill and other leading members of the Cabinet. Another White Paper published July 16 contained legislative proposals for sweeping reform of the British educational machinery to give all children a happier childhood and a better start in life. The Government's £80,000,-000 educational reform bill, based on these proposals, had its first reading in the House of Commons December 16. Recommendations for dealing with the postwar problems of young people were set forth in still another White Paper drawn up by the Youth Advisory Council at the request of the Board of Education and published September 15.
The House of Commons on March 18 adopted,

153 to 6, a bill eliminating the old social and economic barriers to the entrance of able men of the poorer classes into the British Foreign Service. There was a particularly active discussion as to the respective roles of private enterprise and government in Britain's postwar economic life, with majority opinion supporting a large measure of

government planning and control.

RONALD STUART KAIN.

GREECE. A Balkan kingdom, occupied by German and Italian troops in April-May, 1941. Capital, Athens. Greece has an area of 50,147 square miles (mainland, 41,328; island, 8,819). The population was estimated at 7,200,000 in 1941 (7,336,000 at 1940 census). Estimated populations of the chief cities in 1939 were: Athens, 392,781; Piraeus, 198,-771; Salonika (Thessaloniki), 236,524; Patras, 61,-278; Kavalla, 49,980; Canea, 26,608; Corfu (Kerkyra), 32,221.

Religion and Education. School attendance in 1937-38 was: Elementary, 985,018; secondary, 92,687; university, 7,998. The American-founded Athens College, with about 500 students, was closed in October, 1940. Illiteracy remains high. The 1928 census returns showed 5,961,529 members of the Greek Orthodox Church, 126,017 Moslems, 72,-791 Jews, 35,182 Roman Catholics, and 9,003

Protestants.

Production. Previous to the war about 54 per cent of the working population was supported by agriculture and fishing, 20 per cent by industry, and 8 per cent by commerce. The country was dependent upon imports for more than 25 per cent of its total food consumption and for 40 per cent of the wheat consumed. With the decline of food production due to war conditions and Axis requisitioning, Greece became progressively more dependent upon outside sources of supply. The virtual cutting off of imports by blockade, and the disruption of transportation facilities induced famine conditions beginning in 1941. Starvation became worse during the winter of 1941-42, but was later alleviated to some extent by relief supplies delivered through the International Red Cross (see preceding YEAR Books and *History* below)

Wheat production declined from the prewar average of 700,000 metric tons to an estimated 500,000 tons in 1940, 300,000 in 1941, and 280,-000 in 1942. Estimated yields of other crops in 1940, except as stated, were (in metric tons): To-bacco, the main cash crop, 45,000; currants, 121,-775; raisins, 23,000; figs (exportable crop), 22,-000; barley, 239,500; oats, 174,200; rye, 57,900; olive oil, 77,375 in 1941–42; ginned cotton, 16,-900; potatoes, 163,300 in 1939; corn, 261,500 in 1939; wine, about 4,300,000 hectoliters (of 26.42

U.S. gal.) in 1939.

Factory production in 1938 (excluding wine, olive oil, and wheat products) was valued at 13,-552,000,000 drachmas. Mineral output (in metric tons) in 1938 except as otherwise indicated was: Iron ore (metal content), 150,000; pyrites, 217,-000; lignite, 139,000 (205,000, estimated, in 1942); manganese, 5,000; lead, 3,100; zinc, 5,300; chrome, 22,000; nickel-cobalt, 1,300.

Foreign Trade. No official trade statistics have been published since June, 1941. According to the Axiscontrolled Greek press, imports in the calendar year 1941 total 4,840,000,000 drachmas (12,215,-326,000 in 1940) and exports 3,904,000,000 drachmas (9,079,380,000 in 1940). Chief sources of 1941 imports (millions of drachmas): U.S.S.R., 673; Germany, 544; United Kingdom, 354; others, 3,269. Distribution of exports (in millions): To

Germany, 1,825; U.S.A., 904; United Kingdom, 486; Italy, 141; others, 548. The 1941 exports included (metric tons): Dry raisins, 30,800; tobacco, 21,100; olive oil, 2,000; wine, 3,800. Imports included (metric tons): Wheat, 198,000; barley, 17,000; rice, 12,000; sugar, 10,000; coal, 45,000; mineral oils, 97,000.

Finance. The puppet government at Athens reported revenue receipts of 8,315,000,000 drachmas for the fiscal year ended Mar. 31, 1942, compared with an estimated 14,519,000,000 in 1938-39. A total increase of revenue amounting to 10 billion drachmas was indicated for 1942-43. Estimates of the cost of occupation levied on Greece varied from 18 to 180 billion drachmas annually, the latter figure including credits extended to the Axis countries by the puppet regime in Athens. Bank loans, bond issues, and large-scale printing of cur-rency were resorted to to meet the government's expenses.

German exactions and rapidly spreading inflation boosted the public debt far above the 95-billion-drachma level reported for Sept. 30, 1940. The average exchange rate of the drachma was \$0.0082 in 1939. German authorities fixed the official rate at 1 drachma equals 0.0167 reichsmarks, or \$0.0067 (based on the German official rate for the U.S. dollar). The quotation for the pound sterling, which was 1,500 drachmas before the German occupation, was reported at 42,000 drachmas in April, 1942, and 130,000 drachmas in July, 1942. See *History*.

Transportation. In 1940 Greece had approximately 1,864 miles of railways, 8,440 miles of highways, air connections from Athens to most of the principal European cities, and a merchant fleet of some 607 vessels (of 100 tons or over) aggregating about 1,780,700 gross tons. Much of the transportation and communication network was disrupted or destroyed by the Italo-German invasions of 1940-41. Half the merchant marine was destroyed or captured at the same time. The remainder (about 200 ships of 1,000,000 tons manned by 6,000 sailors) entered the service of the Allies under British direction.

Government. Premier John Metaxas administered Greece as a dictatorship from Aug. 4, 1936, until his death on Jan. 29, 1941. The government remained a monarchy in form under King George II, who had been restored to the throne Nov. 25, 1935, in accordance with a plebiscite, to rule under the Constitution of 1911. King George signed the 1936 decrees which suspended constitutional guarantees, dissolved Parliament, abolished political parties, and imposed strict control over the press and other means of communication. Thereafter, all legislation was enacted by royal decree.

Italian forces invaded Greece Oct. 28, 1940. They were driven out by the Greek army, which advanced and occupied one-third of Albania by Apr. 6, 1941, when the German invasion of Greece began. The Greek forces were defeated and a British expeditionary force expelled from the Greek mainland (late in April) and from Crete (late in May). Premier Alexander Korizis, who succeeded Metaxas, committed suicide Apr. 18, 1941. A new Government was formed by Emmanuel Tsouderos April 21. King George and the members of the Tsouderos Cabinet left Athens Apr. 22 and withdrew from Crete May 23. After a temporary stay in Cairo, Egypt, the Government-in-Exile was trans-

ferred to London, effective Sept. 22, 1941.
According to a resolution passed by the Greek National Assembly Oct. 10, 1935, the 1911 Constitution was to remain in force until the enactment of a new Constitutional Charter.. King George on

Oct. 22, 1941, issued a royal decree regulating the functions of state authorities in cases in which the 1911 Constitution could not be fully applied owing to the absence of the Government from Greece. A pro-Nazi puppet regime headed by Gen. George Tsolakoglu was established in Athens Apr. 29, 1941. Tsolakoglu resigned Nov. 23, 1942, and was succeeded by Professor Logothetopulos. For war declarations, see table under World War. For developments in 1943, see below.

#### HISTORY

Axis Grip Weakened. Allied victories in the Mediterranean area during 1943 brought the promise of early liberation to war-ravaged Greece. Mussolini, instigator of Fascist Italy's treacherous and unprovoked attack on Greece in October, 1940, was overthrown July 25. His successor, Premier Badoglio, capitulated to the Allies on September 7 and in mid-October joined them in the struggle against Germany. The Italian Government thereby renounced its claims to conquered Greek territories (see 1943 YEAR BOOK, p. 296) and terminated its military occupation of large parts of Greece.

Immediately after Mussolini's fall, German forces disarmed the large Italian garrison at Larissa, strategically important Greek city commanding the Thessalian plain. The day before the announcement of Italy's withdrawal from the war they began disarming other Italian troops in Greece and seized control of all Italian-occupied territories except the island of Samos in the Aegean. There the Italian forces that had occupied the island in 1940 turned over the administration to Greek authorities representing the Government in Exile. British and Greek units of the Allied Middle East Command immediately occupied Samos and the neighboring Italian Aegean islands of Kos and Leros. In November however, the Germans succeeded in capturing all three islands.

Some of the Italian units in Greece resisted the German attempt to disarm them, but were soon overcome. Others gave away their arms and equipment to Greek guerrillas and civilians in exchange for civilian clothes. Still others fled to the hills to join the Greek guerrillas. But the great majority of the Italian troops were disarmed without difficulty and later sent back to that part of Italy under German control. Meanwhile the Germans intensified their preparations to repel an Allied invasion of Greece. Thousands of Greeks were forced to work on coastal fortifications. According to Istanbul reports, a state of siege was declared in Crete and all southern Greek ports early in May. More German and Bulgarian troops were sent to garrison Greece and late in July all of Creek Macedonia except a small section around Salonika was reportedly placed under Bulgarian rule.

From their newly established airfields and ports in southern Italy, the Allies in the last quarter of the year launched repeated air and sea attacks upon German bases and installations in Greece. By ship and plane they sent arms and supplies and British and American officers to the aid of Greek guerrillas. There were amphibious attacks upon German defenses, such as the raid by British units on the night of July 4 that destroyed a number of German

planes and fuel dumps in Crete.

Guerrilla Warfare. The foregoing developments, combined with the growing harshness of Axis rule and particularly the drafting of Greeks for forced labor in Greece and Germany, gave added mo-mentum to the guerrilla warfare against the occupationary forces that had developed on the Greek mainland and on some of the Greek islands during 1941–42. There was a steady expansion in the number of guerrillas, in the quantity of their military equipment, and in their anti-Axis activities. In May the Greek Government reported that 50,000 armed guerrillas were active in the mountainous districts and that "sea guerrillas" had seized a small fleet of Axis vessels and were using them to harry Axis coastwise shipping. Other estimates placed the

number of guerrillas at 30,000.

Early in September British staff officers returned to Cairo after conferring with guerrilla leaders in Greece and Yugoslavia. A New York Times dispatch of September 7 from Cairo stated that Greek guerrilla activities had been unified under the direction of Lieut. Gen. Sir Henry Maitland Wilson, Allied commander in the Middle East, as a result of an agreement signed by guerrilla leaders and a British general representing Wilson on July 20. At the command of General Wilson, Greek guerrillas carried out a 20-day offensive against Axis forces in Greece as a diversion to assist the Allied invasion of Sicily. The guerrillas were particularly effective in disrupting railway traffic and other German communications. British liaison officers were said to be operating with each of the principal guerrilla bands, which the Greeks called Andartes.

By the latter part of 1943 these gradually expanding guerrilla forces were said to be in control of most of Greece, with the exception of the larger towns and communications lines. They governed the areas under their control with the aid of locally elected councils and committees. However the guerrillas were divided into three large rival groups and into many small independent bands. According to a New York Times dispatch of October 17 from Cairo, the strongest of the guerrilla organizations was the Greek National Liberation Front, known as the E.A.M.; its armed forces were called the Popular Liberation Army, or E.L.A.S. Both the E.A.M. and E.L.A.S. were described as comprising all sorts of Greek patriots but as being "largely directed by the Greek Communist party." Athanasios Klaras, former Communist deputy in the Greek Parliament, was the dominant force in the movement.

The principal rival of the National Liberation Front was the Greek National Democratic Army, known as E.D.E.S., commanded by a former Greek army colonel, Napoleon Zervas, who assumed the title of general. His organization was strong in Epirus and Thessaly. It had no well-defined political program beyond ridding Greece of the Germans. A third group, the National and Social Liberation movement, or E.K.K.A., under the command of a Colonel Psarros, was active in central Greece and the Peloponnesus. These rival guerrilla leaders were brought together by the British military mission referred to above. In the agreement signed with the head of the mission on July 20 they undertook to act in concert and avoid conflicts in order to intensify pressure against the Axis.

Outbreak of Civil War. As the prospect for early liberation of Greece improved, however, rivalry between the guerrilla organizations was intensified. On October 9 civil warfare broke out between the Communist-led E.L.A.S. forces and the E.D.-E.S. under General Zervas. According to C. L. Sulzberger, New York Times roving correspondent, "the Communist-led organization, fearing the Germans might evacuate before it had established its full powers, ordered its armed forces to attack rival guerrilla units with the purpose of seizing control and thereby present to the Allied armies, when they arrive(d), a fait accompli."

He reported that the E.L.A.S. had eliminated much of the strength of Colonel Psarros's E.K.K.A. organization in quarrels that broke out in August. The Communist-led forces then succeeded in securing the major portion of the arms which Greek guerrillas seized from Italian troops at the time of the Italian armistice. Soon afterward they surrounded and disarmed a number of E.D.E.S. bands engaged in recruiting in Thessaly and western Macedonia. Then on October 9 they launched a surprise attack upon the main supply base of General Zervas's E.D.E.S. forces, seized most of the latter's military equipment, and drove them back into the arms of German forces that had been attacking the Zervas units from another direction.

Zervas was said to have recovered much of the lost territory, but his forces were considerably weakened in the fighting against both Germans and E.L.A.S. Partisans that continued until severe winter weather in mid-December forced a lull. Colonel Psarros's E.K.K.A. group appears to have remained on the sidelines in the struggle between the Zervas and Communist-led forces. On October 21 General Wilson broadcast an appeal to the Greek patriot groups to cease their "useless and fratricidal strife." He warned that the Germans were trying to weaken the Greeks by promoting internecine conflicts. But neither this appeal nor the mediatory efforts of British and American liaison officers in Greece effected a reconciliation of the rival guerrilla movements up to the year's end.

Resistance to Axis Rule. Internecine strife intensified the agony of the Greek civilian population. But though scourged by hunger, disease, and the brutalities and economic exactions of the Axis occupationary forces, the Greek people continued their stubborn resistance to enemy rule. Civilian sabotage of Axis railways, ammunition dumps, and factories was on the increase, according to reports reaching the Allied world. Each act of sabotage and each attack by Greek patriots upon Axis soldiers was punished by the wholesale execution of hostages. Among 15 hostages shot early in 1943 in reprisal for an explosion aboard a German ship in the port of Piraeus was Thanos D. Skouras, nephew of the well-known Greek-American moving picture executives of the same name. The death penalty was proclaimed for Greeks aiding the guerrillas or Allied soldiers and harsh punishment was meted out for lesser offenses.

The Greek Government-in-Exile on March 24 declared that 20,000 Greeks had been slaughtered by occupationary forces. The Bulgarians were accused of murdering 15,000 persons in Thrace and Macedonia, while Germans and Italians were said to have executed 3,000 Cretans in reprisal for guerrilla activities and shot 2,000 Greeks in various parts of the mainland. Speaking for the British Government in the House of Commons March 24, Richard K. Law, Under-Secretary of the Foreign Office, said the Bulgarian Government was systematically seeking to nationalize occupied Greek territories and expelling many of the inhabitants to make room for Bulgarian immigrants. The measures of expropriation, he declared, were null and void in the view of the British Government and would "have to be undone at the end of the war."

New massacres and deportations in the Bulgarian-occupied regions provoked a general strike of protest in Athens on June 25. Anti-Axis demonstrations in Athens and other towns were broken up by occupationary forces, which fired on the demonstrators. There were numerous arrests and executions. During the last months of the year German terrorism became more extreme as the

danger of an Allied invasion mounted. Cairo reports said that in August 50 hostages were shot in one Greek village in reprisal for the assassination of a German soldier. About the same time 93 Salonika residents were executed as a warning against further sabotage. During the last quarter of the year the Germans reportedly made a systematic effort to root out guerrilla activities in areas adjacent to their lines of communication. Village after village was burned, and the occupants were arrested, shot, or driven into the hills. The Greek Department of Information in Cairo claimed that more than 100,000 Greeks were made homeless in this fashion.

The famine, which caused an estimated 100,000 deaths in Athens alone in 1942, was alleviated during the first part of 1943 by Allied and neutral relief shipments passed through the British blockade. However food conditions became worse again in the autumn as a result of Axis looting and burning and the spread of armed hostilities. At the end of October Greek authorities in London reported that 2,500,000 of some 7,000,000 people in Greece depended upon the Red Cross for sustenance. By the autumn of 1943 inflation had reached fantastic levels and the drachma had become virtually worthless, there being some 20 times the prewar total of paper money in circulation. The nominal sterling rate for the drachma was reported on August 1 at about 1 pound to 20,000 drachmas as compared with 1 to 550 before the war.

New Pupper Premier. A further change in the puppet Greek government established by the Nazis in Athens was announced by D.N.B., the official German news agency, on April 7. The administra-tion headed by Prof. George Logothetopulos resigned. Jean Rhallis, Greek politician, formed a new Cabinet in which he held the posts of Prime Minister, Minister of Defense, and Minister of Supply. On December 30 the Greek Governmentin-Exile deprived all Greeks who had accepted ministerial posts in the puppet government of their citizenship, military rank, and positions in the

public service.

Government-in-Exile. The prospect of the early liberation of Greece produced new tensions and important changes in the plans and composition of the Greek Government-in-Exile. Though composed of Greeks of varying political color, the Cabinet had heretofore subordinated most of its partisan differences to the task of liberating the homeland, regaining the territories annexed by Axis nations, and working out a federative alliance with Yugoslavia and Turkey that would safeguard Greece's future position in southeastern Europe. The Government also pressed Greece's claim to the Italian Dodecanese Islands and to a section of southern Albania including the towns of Koritza and Argyrocastron. It further indicated a desire to win the cession of Cyprus, with its partly Greek population, from Britain.

The Greek Government was consulted by the Allies in formulating the terms of the Itailan surrender. Immediately thereafter Premier Tsouderos publicly demanded the cession of the Dodecanese Islands to Greece and participation by Greek officials in any interim Allied administration. The Allied acceptance of the Badoglio Government as a co-belligerent in mid-October was done over Greek protests and provoked a violent reaction. Premier Tsouderos on October 14 declared that Greece would be "within her right" in refusing to abide by a decision contrary to her national interest but that the Government would raise no further ob-

jection to Italian co-belligerency. Nevertheless members of the Cabinet expressed the Greek feeling of hurt pride by offering their resignations to the Premier the same night. He refused to accept

The long-standing monarchist-republican controversy, basic to Greek politics since the split between Premier Venizelos and King Constantine in World War I, was revived in the spring of 1943 when Allied victories in Tunisia presaged an early invasion of southern Europe. The first major break in the Government-in-Exile came on March 6 with the resignation in Cairo of Panayiotis Canellopoulos, a republican and former anti-Axis underground leader who became Vice Premier and Minister of Defense in May, 1942, following his escape from Greece. No reason was given for the resignation except a statement by Canellopoulos that he could be more useful outside the Government.

On March 15 King George II and Premier Tsouderos arrived in Cairo from London by plane. A few days later the King accepted the resignations of Under-Secretary for Navy Adm. E. Cavadias, Under-Secretary for Air and Army Cen. P. Nicolaides, Minister of Education E. Sekeris, and the commander in chief of the Greek Fleet, Vice Adm. A. Sakellariou. The Cabinet posts vacated by these men and Canellopoulos were filled as follows on March 24: Vice Premier and Minister for Navy, George Roussos; Minister for Army and acting Minister for Air, Byron Karapanyiotis; Public Welfare, Emmanuel Sofoulis. The following day it was announced that King George, Premier Tsouderos, and the Ministries of Army, Navy, and Foreign Affairs had moved their headquarters to Cairo from London preliminary to the return of the King and Government to Greece in the wake of Allied armies. Only the Ministries of Information, Shipping, and Finance remained in London. A decree issued at the same time promised military pensions to the families of Greeks who were killed by Axis forces or who perished of hardship and privation

Further Cabinet changes were announced later. On May 8 Sophocles Venizelos, son of former Premier Venizelos, assumed the post of Minister for Navy in Cairo. On June 26 K. Varvaressos resigned as Minister of Finance to become ambassador at large on economic and financial matters in Great Britain and the United States. Premier Tsouderos

took over the Finance Ministry.

Meanwhile Premier Tsouderos, in a speech to veterans of the Greek War at Alexandria on April 20, promised that "when the Greek flag is again hoisted over Athens our duty will be to resign our mandate to govern so that a comprehensive coalition government may be formed, including all the national forces, those already existing as parties as well as the fighting organizations. . . ."

Subsequent broadcasts to Greece by King George and members of the Government in Cairo indicated disquiet at the controversy that had developed in Greece over the question of the monarchy and the future policy of the Government.
On July 4 the King broadcast the following pledge:
"... as soon as the security of our country warrants it and military considerations allow, free general elections will be carried out for a constituent assembly. These elections will be held within six months (after liberation) as already decided by my Government. . . . I shall be the first to respect (the elections). . . . All the laws of the 1911 constitution bearing on this subject are in force and will remain so until the Greek people expresses its sovereign will. As soon as it is possible to transfer the seat of the government to Greece the members of the present Government . . . will hand them their resignations. Thus a new government will be formed fully representative of all the associations and currents of the country's public opinion. This government will be made up by leaders whose presence will guarantee freedom and orderly elections."

On July 5 all members of the Cabinet in Cairo endorsed the King's promise to abide by the people's electoral decision on the republic-monarchy issue. Their declaration also made it clear that whatever the future regime, it would be based on popular consent and operate through democratic

institutions.

The British Foreign Secretary, Anthony Eden, who had been working to compose political differences among the Greeks, publicly commended these declarations. Nevertheless they did not dispel distrust of the King arising from his acquiescence in the Metaxas dictatorship of 1936—41. Representatives of the leading guerrilla organizations arrived in Cairo August 10 to inform Allied military authorities that they opposed the return of King George to Greece in advance of a plebiscite to determine the country's future government. A similar declaration was made to the Greek Government a week later by the more conservative underground leaders of all the Greek parties belonging to the prewar Democratic Coalition. The Greek Cabinet was reported to have unanimously endorsed this position.

The King declined to accept this condition. But in response to growing pressure from the Greek Cabinet, the British Government, and even of some monarchist elements within and without Greece, he wrote a letter to Premier Tsouderos on November 8 stating that when Greece was liberated he would "examine anew the question of the time of my return to Greece." This qualified promise was declared unsatisfactory to the warring guerrilla factions in Greece. Indeed the Communistled E.A.M. insisted that national elections for a constituent assembly should be held under its own supervision. The controversy over the King was reported to have caused some disturbances among the Greek armed forces in the Middle East.

See Bulgaria, Great Britain, Hungary and Italy; Naval Progress; World War.

GREENLAND. The world's largest island, situated off the northeastern coast of Canada and forming the only colonial possession of Denmark. Area, 736,-518 square miles, of which all except 131,924 square miles along the southern, eastern, and western coasts is capped with a thick layer of ice. Estimated population in 1943, about 500 Danes and 18,000 native Greenlanders. The chief settlements are Julianehaab (about 700 inhabitants), Godthaab (800), Sukkertoppen (800), Kutdligssat (700), Godhavn, and Angmagssalik. The whole population professes the Lutheran faith. The natives speak an Eskimo dialect, while the language of the Europeans and some natives is Danish. In addition to grade schools, there are high schools in two of the chief settlements and a teachers' training school in Godthaab.

Production, etc. The most important export product is cryolite, a mineral used in the manufacture of aluminum. Exports in 1941 were about \$4,000,000, with cryolite accounting for nine-tenths of the total. Some graphite, copper, asbestos, and mica is exported, and coal is mined for local use. Other exports are blubber, liver, skins, hides, eider down, pird feathers, and fish. There are a few sheep and

goats, but no agriculture. Commerce is a monopoly of the Danish Government and its representatives in Greenland. Governmental revenues (4,810,000 Danish crowns in 1938) come mainly from royalties on cryolite production and to a small degree from the profits on the Government's trade monapolar

nopoly.

Government. Normally the administration and trade of Greenland is controlled by a department of the Danish Government in Copenhagen, with a director directly responsible to the Prime Minister. For local administration, the habitable sections of Greenland are divided into three provinces as follows: South Greenland on the southwest coast (pop., about 9,000; capital, Godthaab); North Greenland on the west coast (pop., 8,000; capital, Godhavn); and East Greenland on the east coast (pop. about 1,000). North Greenland and South Greenland each have a provincial council, elected from the members of the municipal councils in each district. The provincial councils meet every other year under the presidency of the Chief Administrator for each province.

After the German occupation of Denmark on Apr. 9, 1940, contact between Denmark and Greenland was cut off. The two Chief Administrators established a temporary capital for all Greenland at Godthaab and carried on the government with the assistance of the provincial councils and the Danish Minister in Washington. The provincial councils, meeting at Godhavn on May 3, 1940, affirmed their allegiance to King Christian X, of Denmark. Acting independently of the Germandominated Government in Cophenhagen, the Danish Minister in Washington on Apr. 9, 1941, signed an agreement placing Greenland under the military protection of the United States for the duration of the war (see 1942 Year Book, p. 255). The U.S. Government proceeded to construct an air base and other defense installations in Greenland, costing an estimated \$20,000,000. Since October, 1941, the trade of Greenland has been handled by a special section of the Danish Consulate General in New York.

History. Early in 1943 Danish hunters serving as a U.S. Army sledge patrol discovered a small German landing party which had established a secret radio and weather-reporting base on a remote island off the uninhabited coast of Greenland. The Germans killed one member of the patrol and captured two others. The remainder escaped and gave the alarm. The Germans then attacked and demolished a small Danish hunting and weather-reporting station well above the Arctic Circle, but most of the Danish occupants escaped. The lieutenant in command of the German party later induced a captured Dane to assist him in exploring the Greenland coast. While on this mission, the Dane overpowered the German and after a 40-day sledge trip delivered him to the American military authorities.

Meanwhile U.S. military planes under the command of the noted flier, Col. Bernt Balchen, destroyed the German base and supply ship in a bombing attack during May. Two U.S. Coast Guard cutters set out for the base as soon as ice conditions warranted, carrying American troops. Reaching the site in September, they found it deserted but captured one lost Nazi technician. The cutter sighted German reconnaissance planes on three occasions, indicating that another enemy base existed somewhere in the region.

GRENADA. See WINDWARD ISLANDS. GROUP INSURANCE. See INSURANCE.

**GRUMMAN F4F, F6F, TBF.** See Aeronautics under Types.

GUADALCANAL. See British Solomon Islands; Psychiatry; World War.

GUADELOUPE. A French West Indian colony consisting of two main islands—Guadeloupe proper (Basse-Terre) and Grande-Terre—and the dependent islands of Désirade, Les Saintes, Marie Galante, St. Barthélemy, and St. Martin (northern part only). Total area, 688 square miles. Population (1939 estimate), 310,000. Chief towns: Basse-Terre, capital (13,638 inhabitants), Pointe-à-Pitre (43,551). Chief products—sugar, coffee, rum, cacao, logwood, bananas, manioc. Trade (1938): imports 250,583,000 francs; exports 296,472,000 francs. Budget (1939): 83,608,979 francs (revenue and expenditure balanced). Public debt (Dec. 31, 1938), 12,110,210 francs (franc averaged \$0.0288 for 1938; \$0.0251, 1939). Roads (1940): 754 miles. For Government and History, see Martinique.

GUAM. The island of Guam was ceded to the United States by Spain at the close of the Spanish-American War in 1899. It was occupied by Japanese armed forces on Dec. 12, 1941. Guam, largest and most populous of the Mariana Islands group, is situated in the mid-Pacific, 1,500 miles east of Manila, 1,300 south of Japan, 3,337 from Honolulu, and 5,053 from San Francisco. Land area, 206 square miles, extending 30 miles north and south, and from 4 to 8½ miles wide; estimated population (July 1, 1941), 23,394, which included 21,502 native-born, 812 foreign-born, and 588 members of the naval establishment. The 1940 census population was 22,290 (18,509 in 1930). Capital, Agaña, 12,553 inhabitants in 1941.

The native population is mainly of Chamorro stock, a mixture of the ancient Chamorro people with Spanish, Mexican, Anglo-Saxon, Japanese, and Chinese strains. Under American rule English was used in the schools and in business. Chamorro, the native tongue, was spoken at home. Instruction in public schools was available for all children through the sixth grade. Admission to the seventh, eighth, and ninth grades was limited by competitive examination to 70 pupils per year. High school opportunities were generally for the purpose of teacher training. Enrollment in the public schools in 1940-41 averaged 5,084 and the teachers were Chamorros. An American school, supported largely by tuition fees, was maintained for children of the Naval personnel. Copra is the most important export crop, but small revenues are derived from shipments of alligator pears and kapok. Products grown for local use consist of sweet potatoes, rice, corn, coffee, taro, eggplant, red peppers, and tropical fruits. Trade (year ended June 30, 1941): \$994,010 for imports and \$84,278 for exports.

During the 40 years of American possession the people had acquired to a considerable extent the American language, manners, and outlook. Guam was a U.S. naval station; its Governor and Commandant of the station was a naval officer appointed by the President. Although the people were not American citizens they were United States nationals and ruled by a civil code established by the Governor. The Governor had both executive and legislative powers. The Guam Congress consisted of a House of Council (16 members) and a House of Assembly (27 members) with authority only to advise the Governor. Planes of Pan American Airways operating between Alameda, Calif., Manila, and Hong Kong stopped regularly at Guam

before the extension of war to the Pacific. A cable station on the island relayed messages between San Francisco and the Philippines, China, and Japan. See Japan.

CHARLES F. REID.

GUATEMALA. A republic in Central America. Capital. Guatemala City.

Area and Population. Area 48,290 square miles; population, 3,284,269 at census of Apr. 7, 1940. Some 65 per cent of the population are Indians and the bulk of the remainder are mestizos. There were about 45,000 foreigners. The small ruling class is largely of European origin. Poulations of the chief cities with their suburbs in 1940 were: Guatemala City, 176,780; Quezaltenango, 30,125; Cobán, 26,774: Zacapa, 18,094.

774; Zacapa, 18,094.

Defense. Military service is compulsory. As of Jan. 1, 1941, there were 40,566 men in the land and air forces of the country, including 34,808 trained reserves. Under an agreement signed May 27, 1941, a U.S. Army officer was detailed to serve as Director of the Polytechnic School (Guatemalan military academy). A Civic Guard, composed of volunteers of 50 to 60 years, was created in 1942.

Education and Religion. About 80 per cent of the adult inhabitants are illiterate. In 1940 there were 142,335 pupils in 2,485 primary schools, 5,574 in 28 secondary schools, and 694 in the University of Guatemala. On Mar. 1, 1943, the President reported that 2,691 schools were operating, or 71 more than the previous year. He said that in the year ending Mar. 1, 1943, 51,246 children and adults were taught to read and write (48,116 in schools). The population is predominantly Roman Catholic, but others enjoy freedom of worship.

schools). The population is predominantly Roman Catholic, but others enjoy freedom of worship. Production. Coffee and bananas make up about 90 per cent of all exports. The chief crops in 1940–41 were: Coffee, 1,100,785 quintals (of 101.4 lb.); bananas, 7,151,593 stems; sugar, 22,766 short tons in 1941–42; also corn, wheat, beans, rice and plantains. Exports of coffee for the period Oct. 1, 1941, to Sept. 30, 1942, totaled more than 100,000 tons. The 1942 livestock population was: Cattle, 630,256; horses, mules, and asses, 148,454; sheep and goats, 477,190; swine, 289,887. This represented an increase of almost 100 per cent since 1930. Other products include chicle (1,769 short tons exported in 1942), gold, chromite, salt, honey, cattle hides, rubber, cotton, coconuts, sulphur, and hardwoods. The United Fruit Co. began abaca cultivation on abandoned banana plantations in 1942. Industrial establishments consist mainly of coftee-cleaning, sugar-refining, and flour mills, and shoe, soap, and pottery factories.

Foreign Trade. Imports in 1942 totaled \$13,672,000 and exports \$20,437,000 (\$13,415,756 and \$14,505,000, respectively, in 1941). The United States supplied about 70 per cent of the 1942 imports and took over 90 per cent of the exports by value. Value of the chief 1941 exports: Coffee, \$6,557,478; bananas, \$4,258,119; chicle, \$1,013,725.

Finance. Budget estimates for the fiscal year ended June 30, 1943, balanced at 10,033,000 quetzales (1 quetzal equals 1 U.S. dollar), as compared with 10,223,000 quetzales in 1941–42. The public debt was reduced during 1942 to a total on December 31 of 3,877,134 quetzales (internal) and £1,520,432 (external). Redemption of the foreign debt, suspended in 1932, was resumed in 1940.

Transportation. Guatemala's 737 miles of railway line were connected with the Mexican and U.S. railway networks in 1942 by the completion of the Suchiate River bridge between Mexico and Guate-

mala. The Guatemala branch of the International Railways of Central America carried 650,622 tons of freight and 1,506,214 passengers in 1941. Highways extended 4,205 miles on Dec. 31, 1942. The pioneer road for the Inter-American Highway was completed across Guatemala in 1942. The republic is served by domestic and international air services.

Government. The Constitution of Jan. 1, 1928, as amended, provides for a President elected for 6 years and ineligible for reelection, a single-chambered National Assembly of 74 members elected by popular vote for 4 years, and an appointive Council of State of 7 members which supervises public contracts and concessions. President in 1943, Gen. Jorge Ubico, who assumed office Feb. 14, 1931, and had his term extended by a hand-picked Constituent Assembly on July 10, 1935, to Mar. 15, 1943. A similar Constituent Assembly on Sept. 11, 1941, reelected Ubico for the 1943-49 term. Guatemala declared a state of war with Japan December 8, and with Germany and Italy Dec. 11, 1941. For 1943 developments, see below.

History. Political conditions remained stable and economic conditions relatively satisfactory throughout 1943. That the alert Dictator-President, General Ubico, was not taking any chances on a possible military coup against his Government was indicated by developments in the spring. On April 30 a Presidential decree deprived the War Ministry for the duration of the war of its powers of in-spection of the armed forces and placed this function in the hands of an Inspector General named by the President. This was followed on May 14 by the announcement that Ubico had appointed a new Minister of War, Gen. Pedro Zamora Castellano, and had named Gen. José Reyes as Inspector General of the Army.

Continuing his close wartime collaboration with the United States, the President extended the measures against Axis nationals taken in 1942. In March 105 German women, children, and men over military age were repatriated from Puerto Barrios on a Spanish ship. The Government con-tinued its acquisition of German-owned plantations and on October 30 expropriated the Germanowned Verapaz Railway, connecting Puerto Barrios with rich coffee lands in the interior. Other decrees levied new taxes on exports of cinchona bark, honey, and wax from Axis-owned plantations. A tax of 50 cents per 100 lb. of coffee grown in Axis plantations was imposed in 1942.

Effective in May, the U.S. and Guatemalan Governments exchanged Ambassadors instead of Ministers. At the request of the Guatemalan Government, the U.S. Government contracted on July 17 to detail a lieutenant colonel in the U.S. Army to serve as director of the Polytechnic School of Guatemala. In October the United States stopped work on the pioneer road along the route of the Inter-American Highway on which work was begun in 1942. The Guatemalan Government then undertook to finish the uncompleted sections of the 200-mile road project in accordance with the U.S.

Army engineers' plans and specifications.

A commission of United States sanitary experts studying conditions along the Inter-American Highway arrived at Guatemala City June 24. On August 3 it was announced that the headquarters of the Pan-American Sanitary Office for the Caribbean area would be transferred from Panama to Guatemala. This decision was influenced by the allocation to Guatemala in August, 1942, of \$750,000 by the Institute of Inter-American Affairs, a United States agency controlled by the Coordinator of Inter-American Affairs at Washington, for a cooperative public health program. Not more than \$500,000 of this sum was to be expended for the construction of a hospital. A new tri-weekly air service opened June 13 brought Guatemala City

within 5½ hours of New Orleans.

Economically, Guatemala benefited as a result of the war. Successive large crops of high-grade coffee were sold in the United States at top prices. Trade with Mexico increased as a result of the opening of the Suchiate River railway bridge in 1942. United States war contracts for rubber, abaca, and other products, expenditures by United States military units stationed in Guatemala, and funds advanced by Washington for highway construction, sanitation, etc., helped to maintain full employment. Moreover, the Government took effective steps to meet the danger of inflation through a program of price control and wage ceilings. During 1943 the President imposed minimum wages in certain industries and ordered all plantations to produce articles of prime necessity.

GYMNASTICS. The national A.A.U. championships, held in New York in May, provided a fitting climax for an interesting year in gymnastics. Arthur Pitt, veteran from the Swiss Society of Union City, N.J., again dominated the men's division, retaining the all-around title with victories in calisthenics and on the horizontal bar and side horse. Mrs. Pearl Perkins Nightingale of Philadelphia kept the women's all-around crown, taking three of the four tests that figured in the scoring for that title.

Penn State, which also won the Eastern intercollegiate championship, captured the A.A.U. team title. Chuck Lebow, Lions' star, set a new world mark of 0:03.8 in the 20-foot sitting rope climb in the college meet in which he also took laurels on the horizontal bar.

HABEAS CORPUS. See HAWAII under History; LAW under War Decisions.

HADHRAMAUT. See ARABIA under Aden Protectorate.

HAITI. A West Indian republic, occupying the western third of the island of Haiti or Hispaniola. Capital, Port-au-Prince.

Area and Population. Area, 10,700 square miles; population, estimated, 2,663,000 (1,631,000 at 1918 census), exclusive of white foreign residents. With the exception of some 3,000 white foreigners and a few thousand mulattoes, the inhabitants are all Negroes. Estimated populations of the chief cities in 1942: Port-au-Prince, 125,000; Cap Haitien, 20,000; Gonaïves, 20,000; Aux Cayes, 15,000;

Saint Marc, 10,000; Jacmel, 10,000. French is the language of government and the educated class. The peasants, comprising more than 80 per cent of the population, speak Creole French.

Education and Religion. About 85 per cent of the people are illiterate. Education in primary schools is nominally compulsory for children between the ages of 7 and 14. There are about 1,060 primary schools with 87,000 pupils (33,000 girls); 6 national lycées and 15 private secondary schools, with 6,000 pupils; 60 farm schools for boys and 8 urban vocational schools for boys and girls, with 12,200 pupils; 2 normal schools; and schools of medicine, law, applied science, and agriculture for higher education. Most of the inhabitants profess the Roman Catholic faith.

Defense. The armed constabulary, organized by United States officers during the American military intervention (1915–34) and since 1934 under Haitian command, has about 4,533 officers and men. A United States military mission was contracted for by the Haitian Government in 1938 to reorganize the military school and act as technical advisors to the general staff of the Garde d'Haiti (constabulary). Arms include a limited number of coast defense guns, a few airplanes, and six coast-

guard vessels.

Production. Agriculture supports the mass of the population. The country's prosperity is largely dependent upon export crops, chiefly coffee. For the fiscal year ended Sept. 30, 1943, the principal exports were: Coffee, 15,936,187 kg. (1 kilogram equals 2.2 lb.) valued at 17,660,210 gourdes (1 gourde equals U.S. \$0.20); sisal, 10,740,045 kg. valued at 9,872,468 gourdes; raw sugar, 11,534,-422 kg. valued at 3,373,835 gourdes; raw cotton, 2,001,899 kg. valued at 2,148,929 gourdes; bananas, 603,695 stems valued at 1,148,689 gourdes; cacao, 1,764,353 kg. valued at 1,278,347 gourdes. Lignum vitae, corn, logwood, cottonseed cake and meal, goatskins, rum, and cashew nuts were other exports. See History for the agricultural program initiated with U.S. financial aid in 1942 and 1943. Manufacturing is confined to sugar refining, rum distilling, and the preparation of tobacco products, canned fruit, and vegetable lard.

Foreign Trade. For the year ended Sept. 30, 1943, imports were valued at 49,202,000 gourdes (42, 285,000 in 1941–42) and exports at 53,073,000 gourdes (42,886,000 in 1941–42). The United States furnished 76.77 per cent of the imports by value in 1942-43 (76.44 in 1941-42) and purchased 80.61 per cent of the exports (79.46 in 1941-42). The British Commonwealth of Nations

accounted for most of the remaining trade.

Finance. For the fiscal year 1942-43 total budget receipts were 32,729,087 gourdes (25,599,256 in 1941-42) and total budget expenditures 28,029,-972 gourdes (27,726,162 in 1941-42). The surplus of 4,699,105 gourdes in 1942–43 contrasted with a deficit of 2,126,906 gourdes in 1941–42. The public debt outstanding on Aug. 31, 1943, was 70,462,450 gourdes and the net debt was 66,-

842,189 gourdes.

Transportation. The republic has about 162 miles of railway line, over 1,545 miles of highways, and connections at Port-au-Prince with the Pan American Airways and Royal Dutch Air Lines Caribbean networks. Incoming air passengers for the year ended Sept. 30, 1942, numbered 1,041; outgoing, 1,567. In 1940-41 a total of 442 vessels of 1,253,681 net registered tons called at Haitian ports.

Government. The Constitution of June 17, 1935, as amended Aug. 8, 1939, vested executive powers

in a President elected for five years by a two-thirds vote of the National Assembly. The National Assembly consists of 37 Deputies, elected for four years by the vote of literate property owners, and 21 Senators, 11 elected by the Chamber of Deputies and 11 appointed by the President for six-year terms. Presidents completing their terms since 1930 become life members of the National Assembly. President, Elie Lescot, who replaced Sténio Vincent on Apr. 15, 1941. For Haiti's war declarations, see table under WORLD WAR. For events of 1943, see below.

History. The many-sided program of agricultural diversification undertaken in 1941 and 1942 by the Haitian Government with United States financial and technical aid was further extended in 1943. President Elie Lescot and an official party visited Washington in mid-October for discussions on the joint war effort and economic relations of the two countries. On November 8 the State Department announced the following results of these conversations: (1) an arrangement to expand the Cryptostegia rubber development program in Haiti with the aid of an expenditure of approximately \$9,600,000 by the U.S. Rubber Development Corporation during 1944; (2) an agreement for the repayment by Haiti of the \$5,500,000 public-works credit extended by the United States Export-Import Bank during 1938-42; (3) authorization of a survey by the Inter-American Development Commission of ways in which both private capital and government agencies might cooperate to develop

small industries in Haiti, particularly after the war. It was further agreed that Haiti would take steps to reduce its dollar-bond obligations, and that the Institute of Inter-American Affairs would continue for three more years its public-health and san-itation program in Haiti. Plans were laid for a cooperative educational project involving the exchange of Haitian and United States educators and students, and for the loan of additional United States agricultural, educational, and taxation ex-

perts to Haiti.

The Haitian-American Agricultural Development Corporation, known as SHADA, expanded its rubber-growing and other activities during the year. United States newspapermen who inspected the activities of SHADA in October, 1943, reported that the original project for planting 100,000 acres of the rubber-bearing Cryptostegia vine had been scaled down to around 75,000 to 80,000 acres, planting of which was expected to be completed by December. A trickle of rubber production had begun. Output for 1944 was variously estimated at 3,000 to 10,000 tons at a cost of 60 cents per pound. Also under cultivation or production by SHADA were over 2,500 acres of sisal, plots of lemon grass and other essential oils, hevia rubber plantations, cocoa plants, lumber, fruits, and spices, and handicraft articles. Employing 75,000 Haitians in October, 1943, it was one of the largest agricultural enterprises in the Western Hemisphere.

On August 11 the U.S. Commodity Credit Corporation contracted to purchase approximately 35,-600 short tons of raw sugar from the 1943 Haitian crop and a minimum of 38,000 short tons from the 1944 crop at \$2.65 per 100 lb. f.o.b. Port-au-Prince. Haitian banana production was reduced by August storms which blew down 50 per cent of the plantings in the Plain of Artibonite. Completion of the first health and sanitation projects in Haiti initiated by the Institute of Inter-American Affairs was reported early in the year. These projects included malaria control, water, and sewage works and the construction of sanitary markets.

In recognition of their increasingly close political and economic relations, the U.S. and Haitian Governments in May raised their respective legations to embassies. See World War.

HAMBURG. See GERMANY under Area and Popula-

HANDBALL. Rubber priorities and traveling conditions again proved severe obstacles to handball in 1943, but the national A.A.U. four-wall championships were held, Joe Platak of Chicago getting enough time off from his duties in the Navy to win the singles title for the eighth time. Platak, unable to defend his honors the previous year, succeeded Jack Clements, Coast star, as champion. The doubles crown was annexed by Joe Gordon and

H. Smith of the Pacific Coast Club. Bill Lauro of the Brooklyn Central Y.M.C.A. became the second man in the history of the sport to win the New York State one-wall and four-wall laurels in one season, Ecky Galowin having turned

the trick in 1926.

HAWAII, Territory of A Territory of the United States, composed mainly of the eight inhabited islands of the Hawaiian Island group, in the North Pacific Ocean and within the tropics. Capital, Honolulu, on Oahu Island, 2,408 miles from San Francisco.

Area and Population. The islands that form the Territory have a combined area of 6,407 square miles. Their population of Apr. 1, 1940 (U.S. census), numbered 423,330; 1930, 368,336. The estimated population on June 30, 1941, was 465,339, itself. divided as follows: City of Honolulu, 200,158; County of Honolulu (exclusive of Honolulu City), 110,345; City of Hilo, 22,667; County of Hawaii (exclusive of Hilo), 45,731; County of Maui, 52,-495; County of Kauai, 33,479; County of Kalawao, 464. There were 387,197 citizens (139,299 Caucasians, 124,351 Japanese, 52,445 part-Hawains, 24,886 Chinese, 18,050 Filipinos, 8,460 Puerto Ricans, 4,628 Koreans, and 832 others) as compared with 78,142 non-citizens (35,183 Japanese, 34,010 Filipinos, 4,351 Chinese, 2,328 Caucasians, 2,253 Koreans, and 17 others)

For the fiscal year 1941-42 there were 10,385 births, 3,310 deaths (excluding deaths of military personnel in the course of war operations), and 8,449 marriages. Out of 10,116 live births in the calendar year 1941, 3,347, or 33 per cent, were Japanese; 2,523, or 25 per cent, were part-Hawaiian; 2,222, or 22 per cent, Caucasian; 1,043, or 10 per cent, Filipino; 502, or 5 per cent, Chinese;

and 317, or 3 per cent, Hawaiian

Education. Enrollment in the 188 public schools in June, 1941, numbered 91,121. All except 470 of the pupils enrolled were American citizens. The cost of the public schools in 1940-41 was \$7,199,-300 (exclusive of the capital outlay of \$419,726), or an average of \$79.29 per pupil. As of December, 1940, there were 127 private schools, with 833 teachers and 19,836 pupils. Enrollment in the University of Hawaii in 1940-41 was as follows: Undergraduates, 2,030; graduate students, 466; unclassified, 269; noncredit students, 178; summer session students, 1,488.

Production. Sugar and pineapples are the chief products, accounting for about nine-tenths of the normal exports. The output of raw sugar in 1941 was 947,190 short tons, of which 36,618 tons were consumed locally. In 1942 production declined to an estimated 650,000 tons. The pineapple pack for the year ended May 31, 1941, totaled 11,056,-491 standard cases of canned fruit and 11,284,938 cases of canned juice. Other products are molasses, canned fish, meat products, cattle hides, bananas, honey, papaya juice, fiber insulating board, and citric acid.

Overseas Trade. Statistics for 1941 and 1942 were withheld for military reasons. For the calendar year 1940 imports from the United States mainland were \$127,439,539; from foreign countries, \$7,999,-062. Exports to the United States mainland were \$102,145,130; to foreign countries, \$922,335. For details, see 1943 Year Book.

Finance. Revenue receipts of the Territorial General Fund for the fiscal year ended June 30, 1942, were \$22,065,469 (\$23,631,789 in 1940-41). Working cash in the General Fund on June 30, 1942, after payment of claims for personal services, operating expenses, capital outlays, and fixed charges for the fiscal year, totaled \$4,570,862 (\$4,140,361 on June 30, 1941). Cash on hand and in banks of all funds deemed to be in the Treasury amounted to \$24,529,428 on June 30, 1942 (\$19,606,278 on June 30, 1941). The gross bonded indebtedness outstanding June 30, 1942, was \$34,-426,000 (\$36,539,000 on June 30, 1941); net bonded indebtedness, \$23,783,880 (\$25,499,448).

Transportation. Hawaii in 1941 had about 1,038

miles of railway lines including 667 miles of plantation railways; 2,040 miles of highways, with 81,-104 automobiles; and inter-island air and steam-ship services. For the fiscal year ended June 30, 1941, a total of 1,667 vessels of 11,893,803 gross tons entered and cleared the port of Honolulu in the overseas traffic. Incoming ships in 1940—41 carried 2,919,547 tons of cargo and 62,337 passengers; outgoing ships, 1,622,233 tons of cargo and

43,338 passengers.

Government. Governor, Ingram M. Stainback of Honolulu, who replaced Joseph B. Poindexter in 1942. The Governor holds office by appointment of the President of the United States, for a term of four years. The registered voters of the Terri-tory elect quadrennially 15 Senators and biennially 30 Representatives, constituting the Legislature. This body passes appropriations and other acts within the Territorial authority. The popular vote elects to each U.S. Congress a Delegate, with a voice, but no vote, in the House of Representatives. For 1943 developments, see below.

## HISTORY

Hawaii at War. During the year 1942 Hawaii was absorbed in the task of repairing the damage caused by the Japanese sneak raid of Dec. 7, 1941. This repair work continued in 1943 but the emphasis began to shift toward strengthening and increasing defenses. The result was that Hawaii became a huge arsenal, supply base, and staging area for operations against Japan. Pearl Harbor is the principal naval base of the United States, and the largest repair base for the Pacific Fleet. The Islands are considered the main defense for our Pacific Coast as well as the springboard for Pacific offensives. Civilian activities kept pace with the increasing military preparations. Food production and food stocks were increased and business was reported "the best in years." From May, 1942, to June, 1943, Hawaii led all the States in per capita purchase of war bonds. In one month, December, 1942, per capita sales amounted to \$20.16, as compared with \$5.43 for the United States as a whole.

On February 17 the Territorial Legislature convened for its initial war session, without any member of Japanese ancestry for the first time since 1931. Roy Vitousek, Speaker of the House of Representatives, praised the Army's handling of martial law, which had been in effect since Dec. 7, 1941, and promised full cooperation of civil authorities. One of the first proposals to be considered was a bill to prohibit the teaching of Japanese in the schools. The Legislature later requested that Delegate Joseph R. Farrington, Hawaii's representative in the U.S. Congress, introduce a bill in that body granting statehood to Hawaii.

Delegate Farrington and civilian Governor Ingram Stainback also agitated in Washington for the abolishment of martial law. After conferences between the War, Interior, and Justice Departments with the Governor and with Lieut. Gen. Delos C. Emmons, governmental functions were restored on March 10 to civilian authority, with several exceptions. Those functions restored were: price control, rationing, food production and distribution, rent control, health, business licensing, custody of alien property, censorship of civilian mail, liquor control, labor regulation (except on military projects), and all court functions, except in cases of military personnel.

The military retained control of blackout and curfew regulations; the waterfront and other strategic areas remained barred to all except those on military missions. The Army still checked all trans-Pacific travel; the Navy kept cable and radio censorship; the alien population insofar as their activities affected internal security remained under martial law, and their firearms, cameras, and short wave radios were confiscated. Control of labor on war projects was an important item kept under martial law. No strikes were permitted and a worker frozen on his job could be fined for refusing to work. All war workers were investigated and the supply was pooled so as to regulate the huge job of construction and transportation. It was reported that there was no labor unrest on war jobs and that absenteeism was not a serious problem. Suspension of the writ of habeas corpus still remained in effect.

Military rule was kept in the hands of General Emmons, Commanding General of the Hawaiian Department and military Governor of Hawaii. General Emmons was succeeded by Lieut. Gen. Robert C. Richardson, Jr., on June 1. In September, General Richardson's scope of authority was increased by President Roosevelt to include the en-tire Central Pacific area, with the new title of Commanding General of Army Forces in the Central Pacific. This order came immediately after the Quebec Conference and was taken to indicate the change in Hawaii's role from one of defense to one of offense. Toward the end of the year, the blackout restrictions of military rule were somewhat eased. Lights with a new type of shield were permitted on the streets, and unrestricted lighting was permitted in homes and business establishments until 10 p.m. This relaxing was announced by General Richardson with the warning that the islands were still subject to an enemy raid. He also announced the lifting of curfew restrictions for Koreans, thus indicating that they were no

longer to be classed as enemy aliens.

Habeas Corpus Controversy. The imposition of martial law in Hawaii on Dec. 7, 1941, carried with it the suspension of the right to bring habeas corpus proceedings. This gave military authorities the right to intern any suspect, after hearings. On Aug. 3, 1943, Joseph E. Thornton, Chief of the Hawaii F.B.I., announced that 1,479 persons had been interned in Hawaii since the Pearl Harbor attack. Of these only one case, that of Otto Kuehn, had received any publicity concerning legal action taken. On August 15, U.S. District Judge Delbert Metzger ruled the suspension of habeas corpus invalid and issued writs that two German-Americans interned by the Army be produced. Judge Metzger based his ruling on the partial relaxation of martial law which had been proclaimed the

previous March.

At that time Governor Stainback had declared that jurisdiction was restored to the civil authorities "except for certain specified subjects which are primarily of military concern." One of the exceptions made was the continued suspension of habeas corpus. Judge Metzger maintained, however, that if jurisdiction was restored to the civil court in part, it must be restored in full. He, therefore, directed that the writs be served upon General Richardson. Several efforts to serve the papers were blocked by the military police. Judge Metz-ger countered with a citation for contempt of court to be served upon General Richardson. U.S. Attorney Angus Taylor attempted to offer a statement for General Richardson, but was not allowed to make it. He then stated that he had been told by General Richardson to inform the court that the two internees would not be produced in court. General Richardson was then judged to be in contempt of court and a fine of \$5,000 was fixed. He retaliated with an order forbidding any further action in the proceedings, and further ordered that any other habeas corpus proceedings should be immediately dismissed.

On August 26, a statement issued from the War Department in Washington upheld General Richardson and explained that Judge Metzger had "erroneously construed" the relaxation of martial law. The judge was prohibited from enforcing the fine and was even faced with the prospect of a fine himself if he continued the proceedings. Legal precedent for suspension of the writ of habeas corpus was found in a law of Mar. 3, 1853, by which Congress authorized President Lincoln to suspend the writ. Within a few days, however, the issue became less clear-cut. After the public support of General Richardson by the War Department, it was reported that the feeling in Washington was that this example of military rule should be tem-

pered.

The War, Interior, and Justice Departments agreed, after a conference with Hawajian officials, that the issue was constitutional and was to be decided by the civil courts. General Richardson accepted service of the writs of habeas corpus and rescinded his order forbidding the courts to carry on proceedings of habeas corpus. The writs in question were dismissed by the Federal Court and the two German-American internees were taken to the United States and freed. But suspension of the writ of habeas corpus remained effective in Hawaii, with the constitutionality of such suspension still untested.

Selective Service. The working of the draft law in the Territory was considered unsatisfactory by Hawaii's Selective Service Director. He announced

in June that the half of the population with an Oriental heritage was shirking its share of the draft load. He criticized the many requests for deferment. Some were from "non-essential white collar workers, truck drivers, clerks, and even soda fountain attendants." The Director admitted the existence of a manpower shortage, but declared it was partly due to the 40-hour work week. However, enlistments from among American-born Japanese, or Nisei, were encouraging, after announcement by the Army that its ranks would be open to such volunteers.

Under a policy defined by Secretary Stimson, these volunteers were to be trained in special combat units comprising infantry, artillery, engineer, and medical personnel. Hawaii was directed to enlist 1,500 citizens of Japanese ancestry. Within two months after the announcement, 4,100 Hawaiiborn Japanese volunteers were in training either in Hawaii or on the mainland. The increase in number above the original quota came as a result of the small response from mainland Americans of Japanese origin. A contingent of 2,600 left Hawaii at one time for the mainland and were given a typical "chamber of commerce aloha" before the

largest crowd in Honolulu's history.

Civilian Defense. Governor Stainback reported bomb shelters scattered throughout the Islands; emergency hospitals and first-aid stations constructed and staffed by volunteer nurses; the civilian population vaccinated, fingerprinted, and furnished with gas masks. The water supply had been treated against contamination and all utilities were constantly guarded. However, the huge increase in the number of workers with the accompanying overcrowding created special problems of sanitation and health. Tuberculosis was reported on the increase, but a constant guard was maintained against outbreak of tropical diseases. Small epidemics of infantile paralysis and dengue fever were reported to be under control.

See Law under War Decisions.

CHARLES F. REID.

HAY. The hay crop in 1943 was estimated by the U.S. Department of Agriculture at 99,543,000 tons which included 87,264,000 tons of tame hay and 12,279,000 of wild hay, only 5 per cent less than the 105,295,000 tons harvested in the 1942 record crop and compared with the 1932-41 average of 82,952,000 tons. The acreage harvested in 1943, 74,417,000 acres, compared with 72,649,000 acres in 1942 and the average of 68,754,000 acres for the 10-year period. The average yield per acre was

1.34 tons in 1943 and 1.45 tons in 1942.

Important kinds of tame hay, with production totals, included alfalfa, 32,465,000 tons from 14,-983,000 acres; clover and timothy 29,238,000 tons from 20,621,000 acres; lespedeza 5,944,000 tons from 6,114,000 acres; soybeans 4,093,000 tons from 3,442,000 acres; sweet clover 573,000 tons from 458,000 acres; cowpeas 1,011,000 tons from 1,372,-000 acres; peanuts 1,989,000 tons from 4,008,000 acres; small grains cut green for hay 3,892,000 tons from 3,011,000 acres; sweet sorghum (sorgo) for forage and hay 10,993,000 tons from 8,414,000 acres; and other hay crops 8,059,000 tons from 7,007,000 acres.

Production of seed of important kinds of hay included alfalfa seed 1,114,900 bu., red clover 1,142,900, alsike clover 238,900, sweet clover 457,-900, timothy 1,499,600, and lespedeza 159,920,-000 pounds. The total production of the six principal hay crop seeds was 3 per cent smaller than in 1942 but 6 per cent larger than the 10-year

average. The seasonal average price per ton received by farmers for all hay was \$15.91 (December I price) and the estimated value of production was \$1,388,232,000 in 1943 compared to \$10.63 and 980,617,000 in 1942. The accompanying table lists the main States in the production of hay for 1943.

HEATING AND VENTILATING. Other than developments in the associated function of air conditioning (see Refrigeration and Air Conditioning) in which heating is tied up, the outstanding news during 1943 was that in connection with the fuel situation, which changed sharply during the year. The winter of 1942-43 was one in which there was considerable concern over the scarcity of fuel oil; on the whole this situation was well handled, so that by the close of the 1942–43 heating season the fuel oil problem was not so acute. With the threat of a coal strike actually becoming a reality on a small scale in February and in full scale on May 1 considerable concern began to be felt regarding the availability of coal for the 1943-44 heating season. As the summer of 1943 progressed a serious coal shortage appeared inevitable, and by the close of the year the shortage had actually become a famine in some sections, notably New England and the Middle Atlantic States. (See COAL.) In

December when a severe cold wave hit the country thousands of homes and apartments were short of fuel; the area in and around New York City was especially hard hit. In the meantime fuel oil, while not overly plentiful, was coming through in sufficient quantities, and this was loudly commented on by those building owners who had at more or less expense converted from oil to coal. Even while coal was becoming increasingly scarce these conversions had continued, as at Parkchester, the very large apartment house development in the Bronx, N.Y., the conversion of whose power plant was a several hundred thousand dollar un-dertaking which could hardly be stopped once it had gotten under way, although a number of inprocess conversions was finally halted. The Solid Fuels Administration announced in the fall that it would not coupon-ration coal unless forced to. Steps were taken, though, to prevent dealers from delivering coal to places where more than a few days' supply was already in the bins.

The severe metal restrictions during 1943 forced, through pressure by WPB, redesign of many heating plants for war plants. A number of these were redesigned to utilize direct-fired warm air rather than steam or hot water systems. Ductwork for the carrying of heated or ventilation air was to a large extent made of substitutes for sheet metal, such as asbestos cement, various boards, and even plastics; metal piping, however, was not displaced in any important quantities in heating plants by plastic pipe. Wooden grilles replaced many metal

air outlets.

Radiant heating continued to occupy the interest of engineers. Several large airplane hangars near Denver were heated by this method, and it was found to give surprisingly good heat distribu-tion considering the height of these structures; a naval chapel was radiant-heated in Florida, as were several residences.

Research work in heating was retarded during the year. Most laboratories, such as those at universities, were active on military problems. The American Society of Heating and Ventilating Engineers was operating its research laboratory on a limited basis, but appointed a director of research who began to lay careful plans for postwar research. A comprehensive program of investigation of various phases of heating with bituminous coal was undertaken by the Bituminous Coal Research, Inc., an organization of soft-coal mine operators. The work will be done at Battelle Memorial Institute, Co-

lumbus, Ohio.

As compared with well-integrated industries, those firms engaged in heating have always been handicapped by lack of a unified organization comprising all phases of heating. To remedy this, an organization called the Indoor Climate Institute was formed during 1943 to bring together the scattered elements concerned with heating. It included manufacturers, coal, gas, and oil interests, installers, dealers, and contractors, consulting engineers and architects, and others. A broad campaign with the objective of selling the building owner on proper indoor air conditions was inaugurated.

Sheet metal contractors, who install ventilating systems and warm-air heating systems, and who have been without a national organization for some years, formed the Sheet Metal Contractors National

Association during 1943.

The Quartermaster Corps announced that a simple oil-burning unit had been developed to convert the standard Army tent-heating stove into a smokeless oil burner. The device will give as much heat as the coal unit, but the smokeless feature will be advantageous in any theater of operations where smoke would disclose the presence of troops.

The high speeds at which machine tools are run today, made possible by high-speed cutting alloys and rugged machines, coupled with the operation of the machines over the full 24-hour day, has made machine-shop mist a severe problem in some plants. The mist is the vapor from the cooling oil supplied to the cutting edge which, being hot, evaporates the oil and forms the mist. To overcome this, a number of installations of electric air filters were made in connection with ventilating systems; the filter electrostatically charges the particles forming the mist; these particles are attracted to an oppositely charged plate, and from there collected; the cleaned air is then recirculated to the shop. See Electrical Industries.

HIDES, LEATHER, AND SHOES. Mounting military and lend-lease requirements for leather and leather products, particularly shoes, clashed with a marked drop in available supplies, so that hides and leather were pushed into the category of the most critical materials in 1943. The most striking result of this trend was the need of a further tightening in the shoe rationing for the civilian population, which now is based on only two pairs of shoes annually for each person.

Shoe production for military needs jumped from 15 million pairs in 1941 to nearly 41 million pairs in 1942, and increased further to approximately 45 million pairs in 1943. At the same time civilian shoe production which had established a peak of 483 million pairs in 1941 dropped off to 443 million pairs in 1942, and was further reduced to 413 mil-

lion pairs in 1943.

Hides. Total movement into sight of cattle hides in 1943, indicating the amount of hides available for processing into leather, dropped sharply from 25,508,000 hides in 1942 to 22,300,000 hides in 1943. Wettings of cattle hides, that is the actual amount of hides put into process for all types of leather, dropped from 28,232,000 hides in 1942 to 21,800,000 in 1943. This figure includes both domestic and foreign cattle hides. The decline in new supplies became more pronounced as the year progressed and was marked both in domestic and foreign supplies.

The difficult domestic supply situation was fur-

ther complicated by the fact that the normal marketing of hides was seriously disturbed as the result of a sharp increase in livestock and meat black market operations which caused a decided shift from Federally inspected to uninspected slaughter with resultant lowering in the quality of hides, and which also caused the destruction of a substantial number of hides in an attempt to conceal illegal

slaughtering operations.

The decline in hide imports also became more pronounced as the year progressed. Total imports for 1943 are estimated at only 4,700,000 hides as compared with 6,600,000 hides in 1942. The following table shows the development of total hides supplies during the past decade:

|  | Total<br>Hide<br>Wettings                          | Foreign<br>Hides<br>Included                     |
|--|--|--|
| 1934.<br>1935.<br>1936.<br>1937.<br>1938.<br>1939. | 17 million<br>19 "<br>20 "<br>19 "<br>17 "<br>19 " | 1 million 11/2 " 11/2 " 11/2 " 17 " 1.7 " 21/2 " |
| 1941   | 25½ "<br>28 "<br>22 "                              | 5.9 "<br>6.6 "<br>4.7 "                          |

## Estimated.

The sharp decline in hide imports was due largely to an agreement between the United States and Great Britain regarding the division of South American exportable hide supplies. The Combined Raw Materials Board, after an intensive study of the leather industry in Great Britain and the South American hide markets finally recommended centralization of all buying of foreign hides in the hands of the government. This was done to facilitate the allocation of foreign hide supplies between Great Britain and the United States. Under this allocation system, total domestic supplies in the United States and in Great Britain, as well as the available export surplus in foreign countries are added together and then divided between the United States and Great Britain according to a population ratio of three and a half to one. This provides a flexible quota system for hide shipments from South America which at the moment means distribution of these supplies at a ratio of about 50 to 50 between the two major hide buying nations. This arrangement represented an important improvement over the original recommendation of the Combined Raw Materials Board to divide South American hide supplies between the two countries in a ratio of 70 to 30 in favor of Great Britain, despite the fact that historically the United States always had bought the major part of the South American hide surplus. To carry out the new hide purchasing program, a "Joint Hide Buying Office" was created in Washington in which Great Britain and the United States have equal participation, and Canada sits in whenever her interests are concerned.

Leather Leather production in 1943 took a sharp drop in all categories except sheep and lamb, as shown in the following production figures:

PRODUCTION OF LEATHER (In equivalent of hides)

|                            | 1943 b                   | 1942                     |
|----------------------------|--------------------------|--------------------------|
| Cattle<br>Calf and kip     | 25,400,000<br>11,200,000 | 30,828,000<br>12,264,000 |
| Goat and KidSheep and lamb | 37,800,000<br>59,500,000 | 41,127,000<br>53,629,000 |

b Partly estimated.

As far as cattle hide leather is concerned, consumption dropped less than production so that total visible stocks in all hands at the end of 1943 declined to a level of 10,100,000 hides, as compared with 12,225,000 at the end of 1942. This inventory level is generally regarded as the irreducible minimum, and the industry feels very strongly that from this point on, consumption and production must be kept in balance so that no further shrinkage in inventory occurs. This is particularly true because no improvement can be expected in hide imports in 1944, while on the other hand leather demand for lend-lease purposes will be sustained at its current high level. Although shoe and leather demand is expected to be very acute in the liberated areas in

Europe, it is not now contemplated that shoes manufactured from leather will figure high in our relief activities. The emphasis will be entirely on canvas shoes, as it is believed that satisfactory types of shoes have been developed in this general category.

Shoes. The following table shows the trend in shoe production during the past few years according to major types of shoes:

PRODUCTION OF SHOES
[000 pairs]

| Civilian<br>Military  | 1941<br>483,097<br>15,285                                  | 1942<br>442,995<br>40,875                                  | 1948 a<br>413,352<br>44,733                                |
|---|--|--|--|

a Partly estimated. b Except military.

Controls over the use of leather were sharply tightened in 1943 by the War Production Board in order to safeguard military needs. They are now codified in Conservation Order M-310. Distribution is directed by a special "Requirements Committee" in the Tourille Clather of New York 1981. in the Textile, Clothing & Leather Division of WPB. H. LUEDICKE.

HOCKEY. Gloomy Gus and his followers were ready to "bury" hockey for the duration when the 1941-42 season closed, but the sport survived and the National League enjoyed a boom during its 1942–43 campaign, with 1,446,747 paid admissions, an increase of 17,544 per club over the previous winter's average.

The high-flying Red Wings of Detroit carried off the title in the regular league season, then won the Stanley Cup, hockey's richest prize. Detroit's home attendance soared well over 250,000, an all-time club record.

In play-offs leading to the cup finals, Detroit beat Toronto, 4 games to 2, and Boston eliminated the Canadians, 4 to 1. Then, with Goalie Johnny Mowers starring, the Red Wings swept over Boston in four straight contests for world laurels, winning by 6-2, 4-3, 4-0 and 2-0. Individual scoring honors in the league were annexed by Doug Bentley of the Chicago Black Hawks, who tallied 73 points to tie Cooney Weiland's record.

The Coast Guard Cutters of Curtis Bay, Md., carried off the Eastern League title, Buffalo dethrough Indiagapolis as American League ruler.

throned Indianapolis as American League ruler, and Dartmouth won the Pentagonal League championship.

In Canada, the Allan Cup, emblematic of the Senior Amateur championship, was won by the Ottawa Commandos.

HOMES USE SERVICE. See NATIONAL HOUSING AGENCY.

HONDURAS. A Central American republic. Capital, Tegucigalpa.

Area and Population. Area, 46,332 square miles. Population, estimated at 1,038,061 on June 30, 1940 (854,154 in 1930). The people are mainly of mixed Spanish and Indian blood, except for a considerable Negro element in the north coast banana region and some 35,000 aborigines. Population of Tegucigalpa (including the town of Comayagüela), 47,223 in 1940; of other cities in 1935; San Pedro Sula, 32,721; Tela, 14,460.

Defense. Every male citizen is liable to compulsory military service. As of Jan. 1, 1941, the army comprised 2,347 active soldiers and 15,000 trained reserves. Defense expenditures in 1942–43,

2,416,000 lempiras.

Education and Religion. According to the 1935 census, about 67 per cent of the inhabitants over seven years old were illiterate. Of some 113,840 children of school age, 52,612 were receiving instruction from 1,620 teachers in 1940–41. Secondary, normal, and commercial schools had 2,474 students and the National University at Tegucigalpa 357. Roman Catholicism is the prevailing religious faith.

Production. The main occupations are agriculture, stock raising, and mining. The banana industry, the chief source of wealth, was badly hit by the sigatoka or leaf-spot disease, which caused exports to decline from 29,083,665 stems in 1929–30 to 8,458,803 in 1937–38. The disease was being brought under control when the shipping crisis of 1942 resulted in a 50-per-cent decline in banana exports from the 13,436,935 stems shipped in 1940–41. Coffee (45,000 bags produced in 1942), tobacco, henequen, coconuts, corn, beans, sugar, and fruit are other agricultural products. The United Fruit Co. began the large scale cultivation of abaca and rubber in 1942 (see 1943 Year Book, p. 306). Gold and silver normally account for about 20 per cent of the total value of exports, but production fell sharply in 1942. Antimony is also mined. There is some manufacturing for home production and cigars and matches are exported.

Foreign Trade. For the fiscal year ended June 30, 1941, imports were \$10,254,735 and exports \$10,-118,432 (\$10,085,069 and \$9,657,294 respectively in 1939-40). Figures are in U.S. dollars converted from lempiras at two lempiras to the dollar. Leading 1940-41 exports were bananas, \$6,701,839; silver, \$1,312,377; gold, \$966,077; scrap ores, \$440,045. The United States supplied 76.1 per cent of the 1940-41 imports and took 96.3 per cent of the exports. In 1941-42 imports increased 9 per cent and exports declined 7 per cent from

the 1940-41 levels.

Finance. Actual budget revenues in 1941–42 totaled 11,205,000 lempiras; expenditures, 11,647,000. Budget estimates for 1942–43 balanced at 12,-222,000 lempiras. The public debt totaled 17,137,000 lempiras on July 31, 1942. The official exchange rate of the lempira remained at 2.04 lempiras to the dollar in 1941 and 1942.

Transportation. There are three railways with some 920 miles of line on the north coastal region, without international connections. Of 763 miles of highway in 1941, 357 miles were macadam. With financial aid from the United States (see 1943 Year Book, p. 306), the Honduran section of the pioneer Pan American Highway was opened to traffic in 1943 and work carried forward on the Potrerillos-Tegucigalpa highway. The TACA airways link Tegucigalpa with the chief centers of Honduras and neighboring territories, and the Pan American Airways route to Panama passes through Honduras. During 1940–41 a total of 1,350 ships of 1,652,949 tons entered the ports, with 174,847 metric tons of cargo and 5,871 passengers.

Government. President in 1943, Gen. Tiburcio

Government. President in 1943, Gen. Tiburcio Carías Andino (Nationalist), who was elected Oct. 30, 1932, for a four-year term. By constitutional amendment, his term was extended in 1936 for a further six years and in December, 1939, until January, 1949. The Constitution of Apr. 15, 1936, extended the terms of the President, Vice-President, and members of Congress from four to six years; it stipulated that the Constituent Assembly of 59 members (all Nationalists) should automatically become the regular National Congress with the members holding office until Dec. 4, 1942. The new Congress elected Oct. 11, 1942, was composed exclusively of Nationalists. The Honduran Government declared war on Japan December 8 and on Germany and Italy Dec. 12, 1941. For 1943 developments, see below.

developments, see below.

History. The top-heavy economy of Honduras, largely dependent upon exports of bananas and of newly mined gold and silver, was badly shaken in 1942 and 1943 as a result of the war emergency which greatly curtailed the foreign demand for these products. The restriction of trade brought a decline in customs revenues, shortages of essential imports, rising prices, and unemployment

tial imports, rising prices, and unemployment. Financial and technical assistance provided by the U.S. Government helped to mitigate the severity of the resulting economic dislocation. In 1942 Honduras received an Import-Export Bank loan for highway construction and sanitation projects as well as contracts from United States war agencies for the production of rubber, abaca, henequen, and other strategic materials (see 1943 Year Book). United States highway engineers and public health experts were sent to Honduras to assist local authorities in carrying out new public works

projects.

This form of assistance was further extended during 1943. The Institute of Inter-American Affairs, an agency of the Office of the Coordinator of Inter-American Affairs in Washington, announced the conclusion on March 13 of an agreement for United States-Honduran collaboration in a food production program in Honduras and in a road-building project for unemployed banana workers. Funds supplied from Washington made possible the development of a number of Honduran projects for the growing of vegetables and fruits, and for the expansion of livestock production. The cooperative agreement for plantation rubber investigations in Honduras, signed Feb. 28, 1941, was extended indefinitely upon its expiration June 30, 1943. Under the United States purchase program, Honduran rubber exports increased to 30,334 pounds in October, 1943.

pounds in October, 1943.

In mid-February the Honduran Government requested the dispatch of United States banking and economic experts to make a study of Honduran finances and economic needs and to advise it on the establishment of a national bank. This mission

was reported at work in Honduras in June. In recognition of the growing political and economic ties between the two countries, the U.S. and Honduran Governments in May raised their respective

legations to the rank of embassies.

The Government on November 23 announced that it had uncovered a plot to assassinate President Carías Andino and kidnap his wife and daughter. Among those arrested in connection with the plot were some members of the Presidential guard. The dictatorship established censorship over the press and mail for the purpose of "maintaining internal peace and preventing attacks on friendly and Allied governments and peoples," according to an announcement of June 11. See WORLD WAR.

## HONDURAS, British. See BRITISH HONDURAS.

HONG KONG. A British crown colony under control of the Japanese since the surrender of the garrison on Dec. 25, 1941. Total area, 391 square miles, comprising the island of Hong Kong (32 sq. mi.), Old Kowloon (3 sq. mi.), and the New Territories leased from China (June 8, 1898), for 99 years (391 sq. mi.). Total civil population (1941 estimate, excluding 750,000 refugees from China), 1,050,256, of whom 1,026,645 were Chinese and 23,611 non-Chinese. Capital, Victoria. Vital statistics (1939): 46,675 births and 48,283 deaths. Education (Mar. 31, 1941): 1,273 schools and 116,280 students enrolled.

Production and Trade. The chief agricultural crops consisted of rice, sweet potatoes, groundnuts, sugar cane, and fruits. Shipbuilding, fishing, the manufacture of tobacco goods, cement, knit and woven goods, rubber shoes, flashlight torches, and tin refining were the main industries. Trade (1940): imports HK\$752,880,000; exports HK\$662,320,000 (HK\$ averaged \$0.2298 for 1940). Shipping (1940): 28,943 vessels aggregating 21,908,350 tons entered and cleared. Roads (1940): 384 miles.

Government. Finance (15 months ended Mar. 31, 1941): revenue HK\$70,175,115 and expenditure

Government. Finance (15 months ended Mar. 31, 1941): revenue HK\$70,175,115 and expenditure HK\$64,787,557; public debt HK\$27,268,000. Under British rule the colony was administered by a governor, assisted by an executive council. There was a legislative council of 18 members, including the Governor as president. Japanese Governor, Lt. Gen. Rensuka Isogai. See China under History.

HORSES AND MULES. See LIVESTOCK; RACING; countries under *Production*.

HORTICULTURE. Fruit production for the season of 1943 (including citrus fruits for the harvesting season of 1943-44) was the smallest since 1938, or about 12 per cent lower than the record-high production of 1942. Yield per acre was indicated as being 11 per cent below 1942, but a fourth larger than the 1923–32 average. The 1943 season was disappointingly featured by extremely small crops of apples, peaches, pears, cherries, apricots, and strawberries. Winter and spring injury by freezes and unfavorable weather during pollination were largely responsible for the light crop of tree fruits. The smallest strawberry crop since 1920 resulted from a strong reduction in acreage and light yields per acre. However, to partially offset these small crops, the season showed the largest crop of grapes on record, large crops of plums, prunes, and figs, and a likely new high in tonnage for citrus fruits. The estimated production of oranges for the 1943-44 season indicates the largest on record, the grapefruit outlook is for a crop second only to the record crop of 1943, and

lemon production probably will be the third largest yield on record. The accompanying table was compiled from data released by the U.S. Department of Agriculture.

| Crop           | Unit  | 1943        | 1942        | 1932-41 av. |
|----------------|-------|-------------|-------------|-------------|
| Apples         | Bu.   | 88,086,000  | 128,273,000 | 121,641,000 |
| Peaches        | **    | 42,060,000  | 66,365,000  | 55,392,000  |
| Pears          | **    | 24,511,000  | 30,717,000  | 27,938,000  |
| Grapes         | Tons  | 2,790,000   | 2,402,000   | 2,354,000   |
| Cherries       | 44    | 122,000     | 196,000     | 150,000     |
| Prunes (dried) | **    | 206,000     | 177,000     | 215,000     |
| Oranges        | Boxes | 96,290,000  | 89,316,000  | 66,764,000  |
| Grapefruit     | 44    | 49,187,000  | 50,481,000  | 29,310,000  |
| Lemons         | **    | 14,274,000  | 14,940,000  | 10,146,000  |
| Cranberries    | Bbl.  | 686,000     | 800,000     | 610,000     |
| Pecans         | Lb.   | 114,749,000 | 77,200,000  | 91,113,000  |

Combined production of important commercial truck crops in 1943, for the fresh market and for processing, was approximately 10 per cent less than for 1942, but was greater than for any previous year excluding 1941. Both fresh market and processing crops showed deep reductions from 1942. The reduction, however, was partially made up by increased vegetable production in Victory gardens (see AGRICULTURE). The downward trend in acreage for the fresh market, which started in 1940, continued in 1943, and the harvested acreage was the smallest since 1933. Yield per acre, on the other hand, was near the 1942 level and above that of any other year since 1929. The acreage for processing in 1943 was about 3 per cent below that for 1942, but 49 per cent above average. The aggregate yield per acre was down about 11 per cent, due mainly to drought in important areas of production. Production was less in 1943 than in 1942 for all processing crops except snap beans and beets. Combined acreage, for marketing fresh and for processing, was 5 per cent below 1942, but greater than any other year. The estimate of yields of commercial truck crops in the United States, as published by the U.S. Department of Agriculture, is shown in the accompanying table.

| Crop              | Unit   | 1943                     | 1942                     | 1932-41 av.              |
|-------------------|--------|--------------------------|--------------------------|--------------------------|
| Asparagus         | Crates | 9,770,000                | 9,213,000                | 6,845,000                |
| Beans (snap)      | Bu.    | 17,057,000               | 15,980,000               | 14,597,000               |

Total value of sales of commercial truck crops in 1943 was \$717,124,000, as compared with \$514,-617,000 in 1942 and \$255,547,000 for the 1932—41 average, according to the U.S. Department of Agriculture. See Insect Pests.

HOSIERY. See TEXTILES.

HOSPITALIZATION, Federal Board of. An advisory Board of the U.S. Government, organized in 1921 to coordinate the hospitalization activities of the medical branches of the Army and Navy, the U.S. Public Health Service, the U.S. Veterans' Administration, St. Elizabeths Hospital, and the Commissioner of Indian Affairs. On May 7, 1943, it was also designated as an advisory agency to the Bureau of the Budget. It has been charged with the development of a complete over-all program for providing hospitalization for the veterans of World War II. Chairman in 1943: Brig. Gen. Frank T. Hines.

HOSTAGES. See BELGIUM, and the other German-occupied countries, under *History*. HOT SPRINGS CONFERENCE. See UNITED NATIONS. HOURS OF WORK. See LABOR CONDITIONS under Hours of Work and the topics there listed.

HOUSE OF REPRESENTATIVES. The members of the House of Representatives at the second session of the 78th Congress meeting Jan. 10, 1944, are shown in the accompanying list. Political affiliation may be determined by the following, with the number of members in parenthesis: Democrats in roman (219); Republicans in *italics* (207); Progressives in SMALL CAPS (2); Farmer-Labor in CAPS (1); American Labor in *italic* SMALL CAPS (1); vacancies (5); total, 435. Subsequent to this listing two special elections were held in Pennsylvania, involving the Second district where Republican Joseph M. Pratt was elected to replace Democrat William A. Barrett, who resigned; and the Seventeenth district where Republican Samuel K. McConnell replaced J. William Ditter (see Necrology), who died in an airplane crash. Representative Joseph Gavagan, Democrat, of New York resigned on January 11. Representative Lawrence Lewis, Democrat from Colorado, died Dec. 9, 1943; William H. Wheat, Republican from Illinois, died Jan. 16, 1944.

HOUSING. See Construction Industry; National Housing Agency; New Zealand under History; PHILANTHROPY under Buhl Foundation; ROADS AND STREETS; SANITATION; STATE LEGISLATION under War and Postwar; WATER SUPPLY. Compare HEAT-ING; LIVING COSTS; RENTS, ETC.

HOWLAND ISLAND. A mid-Pacific island (0° 49' N. and 176° 40' W.), belonging to the United States. It lies athwart the main steamship lanes and the Pan American Airways route from Honolulu to New Zealand and Australia. An aerological station was established here during 1936 by the U.S. Department of the Interior (see Year Book for 1936, p. 79, under Baker, Howland, and Jarvis Islands). An airfield was constructed during 1937. The aerological installations were attacked by Japanese planes after the outbreak of war on Dec. 7, 1941. Early in 1942 four youths stationed there were evacuated. U.S. military forces were reportedly stationed on the island.

HUNGARY. A kingdom in central Europe. Capital, Budapest. Regent, Admiral Nicholas Horthy de Nagybánya (elected Mar. 1, 1920). Area and Population. Excluding Yugoslav terri-

tories occupied in April, 1941 (approximately 4,-600 square miles with a census population of 1,-026,000 on Oct. 10, 1941), Hungary had an area of 61,872 square miles and a population of 13,-643,600 at the census of Jan. 31, 1941, as compared with 35,875 square miles and a population estimated at 9,034,815 in 1937. An area of 4,605 square miles, with a 1941 census population of 1,058,000, was annexed from Czechoslovakia under the Italo-German arbitral award of Nov. 2, 1938. Another 4,690 square miles (population, 698,000 in 1941) was acquired through the annexation of Ruthenia (Carpatho-Ukraine) and additional parts of Slovakia in March-April, 1939. On Aug. 30, 1940, an Italo-German award transferred to Hungary from Rumania 16,642 square miles in North-

ern Transylvania with a population of 2,392,603. According to the 1941 census, Magyars comprised 75 per cent of the population (92.1 per cent in 1930), Rumanians 8 per cent, Germans 6 per cent, Ruthenians 4 per cent, Serbs and Croats 3 per cent, Slovaks 2 per cent, Jews 1 per cent. The live birth rate for 1942 was 21.5 per cent (21.1 in 1941); death rate, 15.4 (14.1). Populations of the chief cities in 1939 were: Budapest, 1,115,877 (1,-162,800 on Jan. 31, 1941); Szeged 131,893, Debrecen, 122,517; Kolozsvár, 100,844; Kecskemét, 83,732; Nagyvárod, 82,687; Miskolc, 73,503; Ujpest, 72,940.

Education and Religion. The 1930 census showed 9.6 per cent of the population over six years of age to be illiterate. In 1938-39 there were 1,407 infants' schools with 133,288 children, 8,103 elementary schools with 1,104,916 pupils, 263 middle schools with 79,435 pupils, numerous primary and secondary vocational and special schools, five state-supported universities with 9,823 students (excluding the University of Kolozsvár in Northern Transylvania, acquired from Rumania on Aug. 30, 1940), and 29 theological colleges with 1,229

According to the 1930 census, Roman Catholics comprised 64.9 per cent of the population within the Treaty of Trianon boundaries, Helvetian Evangelicals 20.9 per cent, Augsburg Evangelicals 6.1 per cent, Jews 5.1 per cent, Greek Catholics 2.3.

Production. Slightly more than half of the work-

ing population is engaged in agriculture and nearly one-fourth in industry and mining. Estimated yields of the chief crops in 1940, including all annexed territories except Northern Transylvania, were (in metric tons): Wheat, 2,067,463; rye 724,122; barley, 693,102; oats, 434,324; corn, 2,964,038; potatoes, 3,441,353; sugar beets, 1,758,209; tobacco, 16,548; fodder turnips, 3,975,845 in 1939. The same vine output in 1939 was 96,145,590 gal. The same territory had 2,605,490 cattle, 1,750,221 sheep, 4,648,463 swine, and 989,450 horses in 1940. The annexations of 1938—41 increased the forested area from 4,921,762 to 6,420,000 acres. Delivery of heavy timber for beams increased to 127,000 cubic meters in 1942 from 99,000 in 1941. Mineral and metallurgical output in 1940 was (in metric tons): Lignite, 10,306,000; coal, 1,207,000; manganese (metal content), 15,700 in 1939; iron ore (metal content), 230,000; pig iron and ferro-alloys, 432,000; steel, 751,000; aluminum, 1,500. The principle of the prin cipal manufacturing industries are milling, distilling, sugar refining, petroleum refining, and iron and steel works. In 1939 there were 4,334 industrial plants employing 341,636 workmen.

Foreign Trade. Merchandise imports in 1942 were valued at 922,800,000 pengö (729,600,000 in 1941); exports, 1,142,400,000 pengös (790,800,000 in 1941). For the distribution of imports and ex-

ports in 1941, see 1943 YEAR BOOK.

Finance. Budget estimates for the calendar year 1943 placed revenues at 4,047,000,000 pengös and expenditures at 4,247,400,000 pengös. The public debt rose from 1,937,400,000 pengös on June 30, 1939, to 4,869,000,000 pengos on Sept. 30, 1942. Official exchange rate of the pengö in 1942, \$0.-1949; average exchange rate in 1940, \$0.1848; in the first half of 1941, \$0.1977. Currency in circulation rose from 975,000,000 pengös on Dec. 31, 1939, to 3,201,000,000 on June 30, 1943.

Transportation. Excluding Northern Transylvania, the railway trackage in 1940 extended 9,321 miles (mostly state-owned). There were 51,049 miles of roads. Air lines connected Budapest with the principal Hungarian cities and with Vienna, Breslau, and Berlin. The Danube and its tributaries form an

important transportation artery

Government. The monarchical constitution in effect prior to the republican revolution of Oct. 31, 1918, was restored in 1920, but the throne remained vacant. The head of the state in 1943 was the Regent, Admiral Horthy (elected Mar. 1, 1920). A law of July 15, 1937, ended the Regent's responsibility to Parliament. Parliament consisted of an Upper House of about 278 members (76 elected by counties and cities, 95 life members appointed by the Regent, and the rest representing various privileged groups) and a Lower Chamber of 333 members, including representatives of annexed territories, chosen for five years by popular male and female suffrage. In 1939 the secret ballot was introduced for the election of Deputies. The Upper Chamber is partly reconstituted every five

The principal political parties in 1943, with their standing in the Lower Chamber, were: Party of Hungarian Life (nationalist and Christian), 185; Arrow Cross (Hungarian Nazi) party, 42; Transylvanian party, 41; Rejuvenation (pro-fascist) party, 20. Premier at the beginning of 1943, Nicholas Kallay, appointed Mar. 7, 1942.

Hungary adhered to the anti-Comintern Pact Feb. 24, 1939, and to the Three Power Pact, or Axis alliance, on Nov. 20, 1940. It participated in the German invasion of Yugoslavia and declared a state of war with the Soviet Uuion June 27, 1941, and with the United States Dec. 13, 1941. For war declarations against Hungary, see table under World War. See below for developments during 1943.

### HISTORY

Effect of Allied Victories. The steady progress of Allied arms during 1943 brought Hungary face to face with the disastrous consequences of the Horthy regime's pro-Axis policy. It was exposed to the imminent danger of destructive air attacks and to invasion and occupation by either Germany, Russia, or the Anglo-American armies. The grim prospect developed that Hungary, like Italy, would become a battleground for the stronger warring powers and an arena for political and social revolution. This intensified all of the internal and external tensions that had menaced the Horthy regime in 1942 (see 1943 YEAR BOOK).

The aged Regent and the Government of Premier Nicholas Kallay, which was controlled by the landed aristocracy, sought desperately for means of escape from the slowly tightening trap. They made repeated secret peace proposals to the AngloAmerican powers under which Hungary would be permitted to withdraw from the war at the opportune moment without sacrificing the territories recently seized from Czechoslovakia, Rumania, and Yugoslavia. The invariable reply was a stern demand for "unconditional surrender." They approached Turkey and the exiled Governments of Greece and Yugoslavia with belated offers of Hungarian support for a revived Balkan Entente—designed to bolster the independence of the Balkan states—but made no perceptible headway.

They strove desperately to resist German political penetration without provoking German military occupation, meanwhile preparing for the seemingly inevitable armed clash with Rumania over Transylvania. At the same time they resisted the revolutionary social and economic demands of the Hungarian Nazis on the Right and of the socialist and pro-democratic elements on the Left, while carrying on a bitter warfare with Com-

munist and other underground elements.

German Pressure Resisted. Fear of a German defeat, coupled with growing determination to resist German pressures, was reflected in develop-ments in Hungary during January. The two Hungarian army corps in Russia, estimated at 200,-000 to 300,000 men, lost heavily during the Russian winter offensive on the Voronezh front, according to an admission by Premier Kallay on January 23. The Hungarian Government then called home most of these divisions and began the repatriation of 30,000 Hungarian workers from Germany, despite German demands for greater military and economic aid. At the same time Turkish reports said that 45,000 Hungarian workers had been drafted for the construction of fortifications in the Carpathians as a precaution against a Russian break-through from the Ukraine.

In defiance of German demands for enactment of the Nuremberg laws in Hungary, the Government on January 11 equalized the wages paid to Jews and other Hungarians serving in obligatory auxiliary labor organizations. About the same time Justinian Cardinal Seredi, Roman Catholic Primate of Hungary, strongly attacked the Nazi ra-cial and nationalist doctrines as contrary to Christ's teachings. He declared that the Hungarian clergy would refuse to serve them. From Berne, Switzerland, it was reported on January 12 that the underground political groups in Hungary had estab-lished a "national front of independence." In the same month Count Stephen Bethlen, former Hungarian Premier and leader of a coalition of Right and Center groups, reportedly visited Switzerland and Rome in an attempt to initiate peace negotiations with the Allies.

German attempts to secure Hungarian troops for service against Greek and Yugoslav guerrillas were side-stepped in Budapest, and a Berlin demand for total mobilization was bluntly rejected. Hitler then enlisted Mussolini's aid in bringing Hungary into line. Early in April Premier Kallay was invited to Rome, but his talks with Mussolini produced no change in Hungarian policy. The Fuehrer next called Regent Horthy to his headquarters, where further conferences were held for two days, with the highest German and Hungarian army officers

in attendance.

At the conclusion of these conferences on April 18 a Berlin communiqué announced that "Hungary as well as Italy and Rumania have now made it definitely clear that they will continue the war until victory, and that they are making no distinction between the Soviet Union and the Soviet Union's Western Allies . . ." Berlin broadcasts declared that Horthy had promised to oppose any Anglo-American invasion of the Balkans and agreed to "mobilize all Hungary's forces." There were reports that Hitler also urged Horthy to permit the transfer of bombed-out German war industries to Hungary. Subsequent developments indicated that whatever concessions Horthy made were exacted under the threat of German occupation of Hungary and were evaded at the first opportunity.

Parliament Suspended. Soon after the Regent's return to Budapest he suspended Parliament for six months at the request of Premier Kallay. The adjournment of Parliament was described as a move to check an anti-Government propaganda drive by Hungarian Nazi deputies against the Premier's alleged pro-Jewish and pro-Leftist policies. This drive apparently was timed to reinforce pressure from Germany. Meanwhile more Hungarian troops were withdrawn from Russia. Premier Kallay, disclaiming any personal responsibility for Hungarian participation in the attack on Russia, publicly declared that the country could only bear sacrifices in pro-

portion to its strength.

A semi-official statement issued in Budapest early in June asserted that there had been no expansion of Hungary's industrial plants during the preceding 18 months and that none was contemplated. The statement was obviously calculated to avert Allied bombing raids. The resignation of War Minister Col. Gen. William Nagy, who was replaced by Col. Gen. Ludwig von Csata, and the arrest of 372 persons in Budapest on suspicion of violating national security regulations was announced June 12. The German radio on June 27 quoted Premier Kallay as stating that all remaining Jewish property in Hungary would pass into "aryan" hands at the end of the year. But this apparent concession to Berlin was followed by Hungary's refusal to aid the Axis in the defense of Italy, by Cairo reports of new Hungarian peace feelers, and by orders to pro-Nazi organs in Hungary to cease hostile criticism of Britain and the United States.

New Peace Feelers. The overthrow of Mussolini on July 25 was a severe blow to the Horthy regime, which had repeatedly benefited by Il Duce's diplomatic aid against both Germany and the Allied powers. On the previous day, Premier Kallay relinquished the Foreign Ministry to Jeno von Ghyczy, who was said in some quarters to have been selected to carry forward negotiations for a separate peace with the Allies. The Germans reportedly made a new demand on Hungary for troops to replace the Italian garrisons in the Balkans. While rejecting this bid, the Government reportedly agreed to increase shipments of agricultural and industrial products to the Reich.

The Allied advances in Italy and heavy Allied air raids on Ploesti, Rumania, and Wiener Neustadt, Austria, caused growing alarm in Hungary. Repeated attempts were made to convince the Allies that Hungary was aiding Germany as little as possible. Premier Kallay in mid-August declared that there were no German troops in Hungary and that all airfields and other military establishments were in Hungarian hands. Attempts were made to declared Budapest an open city. Anti-Nazi elements in Hungary grew bolder, demanding that the Government take Hungary out of the war immediately. After a special session of the Cabinet, the Budapest radio on August 29 declared that the Government had "but one aim at present, and that is peace." But to his own followers in Hungary, Premier Kallay insisted that he wanted only

a "peace which leaves the country's territorial integrity intact." In mid-September the Budapest radio began broadcasting British, American, and Russian as well as German war communiqués.

Germany Cracks the Whip. After the rescue of Mussolini by the Germans and the establishment of his Republican Fascist regime, a new German-Hungarian crisis arose over the Kallay Cabinet's decision on September 29 to recommend that the Regent continue to recognize Marshal Badoglio as "the sole legal representative of King Victor Emmanuel." Berlin demanded immediate reconsideration of this decision. Under the threat of German intervention, the Government then announced that it had recognized Mussolini's government at Germany's request but that Hungary was not in a position to "take up direct communication" with it.

The success of the Germans in retaining control of the Balkans and most of Italy following the Badoglio Government's capitulation early in September relieved Hungarian fears of an immediate Allied invasion of the Danubian basin. However it was recognized that a new crisis would develop in the spring, and all the Hungarian factions intensified their efforts to shape the coming crisis to their interests. Spreading guerrilla activities in Yugoslavia and outbreaks of sabotage and anti-Government disorders in southern Hungary led to the proclamation of martial law in several southern Hungarian districts early in October. Late that month Communist-led Partisan bands reportedly crossed into Hungary from Croatia. There were new clashes between Rumanian and Hungarian troops along the Transylvanian frontier.

To Resist Invasion. Parliament was reconvened in October at the request of the Social Democratic and Small Farmers' parties. In a series of speeches on foreign policy during December Premier Kallay declared that Hungary would resist any attempt at invasion from whatever quarter it came, that the Government was determined to maintain the Vienna Award under which it obtained part of Transylvania from Rumania, and that only the fear of bolshevism kept Hungary, Rumania, and Bulgaria in the war. Meanwhile the Horthy regime was reported making preparations for a counter-revolutionary movement that would go underground and await its opportunity in the event of the overthrow of the state through invasion or revolution.

See CHEMISTRY; GERMANY and RUMANIA under History.

HURRICANES. During 1943 there were ten tropical hurricanes observed in the Atlantic Ocean north of the Equator and one on the west coast of Mexico. A description of each of these follows.

July 25-28. The hurricane that passed inland over the Bolivar Peninsula, on the upper Texas coast during the early afternoon on July 27, was the most severe storm experienced in the Galveston Bay area since the hurricane of Aug. 16-18, 1915. It was a storm of rather small area but unfortunately passed over the most densely populated and highly developed portion of the Texas coast.

Upper air indications of an approaching storm had been noticed as early as July 23, but no disturbed surface conditions were observed until July 25, when wind shifts from southeast to northeast at Burrwood, New Orleans, and Biloxi indicated a disturbance south of Burrwood. Within a few hours heavy seas were reported on Mississippi Sound. During the next two days the disturbance increased rapidly in intensity and, moving west-northwestward to the Texas coast, passed inland

over the Galveston Bay region, between noon and 1:00 p.m. July 27, as a small intense storm accompanied by full hurricane winds.

The Galveston Airport recorded a maximum wind velocity of 74 m.p.h. and the Houston Airport 85 m.p.h. Other maximum wind velocities were: Port Arthur, 54 m.p.h.; Ellington Field, 54 m.p.h.; and Houston City, 59 m.p.h. The calm center of the storm was felt over almost the entire length of the Bolivar Peninsula; its passage required about an hour. Since, at this point, the center or "eye" was about 12 to 14 miles per hour the calm center or "eye" was about 12 to 14 miles across as it passed inland. The lowest pressure reported during the passage of this storm was 28.95 inches, recorded at both Galveston and Houston. Unusually heavy rainfall accompanied the storm. Damage was estimated at \$10,000,000 in the Galveston area, \$6,250,000 in the Houston area, and \$300,000 in the Port Arthur area, a total of \$16,550,000. Nineteen persons lost their lives.

August 13-19. A tropical disturbance of moderate intensity was first detected on August 13, near 17° N. and 60° W. Moving northwestward until the evening of the 17th, it then turned north and northeastward, passing about 200 miles east of Cape Hatteras. It lost its identity near 41°N. and

August 20-26. This large and intense hurricane was first observed on August 20 in the area east of the Lesser Antilles. Moving in a parabolic course, it passed some distance west of Bermuda, joined with a storm that had moved off Labrador at about 51° N. and 42° W., intensified, and moved rapidly northeastward across the Atlantic and north of Scotland. Winds over 75 m.p.h. were reported at Bermuda, August 24, while the storm center was estimated to be 100-150 miles west of that Island, indicate the large area of hurricane winds that accompanied the storm. At 12 noon, August 24, Bermuda reported a barometer reading of 29.59 inches.

September 1-9. No previous charted history is available for a fully developed hurricane that appeared southeast of Bermuda on September 2. On the 3rd it passed about 125-150 miles east of Bermuda and then began to curve slowly northeastward. At this point, its progress was retarded for several days by a strong high pressure area, after which its course was changed to northwestward, then north, and later to northeastward as it moved into Newfoundland on September 9.

September 14-16. A disturbance developing at about latitude 30° N., longitude 72° W. was accompanied by gale winds as it moved northward and northeastward. It passed about 150 miles east of Cape Hatteras on the 14th, then moved by Nova Scotia, and reached Newfoundland on Sep-

tember 16.

September 15-19. During the night of September 16 a high pressure area, centered over the northern Plains States, blocked the north-northwestward progress of the storm and forced it into a loop which was completed during the 17th. Evidence suggests that this storm was of a violent nature and extended over a wide area during September 16–17. The disturbance, while still approximately 80 miles from the coast, caused a wind of 62 m.p.h. and a tide of 4.5 feet at Freeport, Tex. Galveston about 120 miles distant From the center reported a wind of 38 m.p.h. and Port Arthur about 180 miles removed experienced winds ranging as high as 47 m.p.h. The level of the water in Lake Ponchartrain exceeded all previous records. The lowest barometer reading along

the coast was 29.84 inches observed on September 16, at Freeport. The storm decreased rapidly in intensity during September 18-19. Heavy rains were responsible for most of the damage.

September 28-October 1. Forming southwest of Bermuda on the 28th, this storm developed gale winds as it moved northwestward and passed in-land over the coasts of Maryland and Virginia on September 30. Cape Henry, Va., reported a maximum wind velocity of 56 m.p.h. The lowest pressure recorded at that station, 29.62 inches, was registered about 8:00 p.m. High tides with rain caused flooding of some streets in the downtown portion of Norfolk.

October 1-3. This disturbance was first noticed some distance southeast of Bermuda, and after passing slightly west of that Island on October 1-2, curved to the northeastward and lost its identity in the North Atlantic near 45° N. and 55° W.

October 11-17. A moderate disturbance that moved westward through the Windward Islands near Santa Lucia on the 11th, turned northward near longitude 68° W., passed through Mona Passage, accompanied by hurricane winds, and continued on an almost straight northerly course to the Atlantic coast, where it passed inland near the Maine-New Brunswick border with greatly decreased intensity.
October 21-22. During October 21 and 22 a

tropical disturbance, of moderate gale force, moved through the western Caribbean south of Swan Island into the Gulf of Honduras, and dissipated

near the east coast of Guatemala.

October 9. At 9:30 a.m. a tropical storm of considerable intensity struck the west coast of Mexico, passing inland a few miles south of the Port of Mazatlan, Sinaloa. The disturbance apparently formed in the area between the Revilla Gigedo Islands and the Marias Islands and moved rapidly northeastward to the coast where it destroyed the small towns of El Roble and Palmillas and par-tially destroyed Villa Union and the Port of Mazatlan. After passing inland it apparently dissipated upon reaching the mountain range near the coast. Barometric pressure at the Mazatlan Observatory began to fall at 1:30 a.m. on October 9, reaching a minimum of 28.31 inches about 8 hours later. An extremely rapid fall of .827 inch took place in 8 hours. A maximum wind velocity of 134 m.p.h. was reached about 9:30 a.m. This velocity was recorded for a period of 15 minutes ending when the anemometer was blown away. About 100 persons lost their lives. Property damage amounted to about \$4,500,000. See METEOROLOGY.

### Hurricanes in 1942

Because of the war no information on tropical hurricanes was released during 1942. A brief de-

scription is given below.

The hurricane which swept inland over the Matagorda Bay area of Texas during the early morning hours of Aug. 30, 1942, was one of the most severe storms on record for the Texas coast. Gales and hurricane winds prevailed over a path about 250 miles wide, with storm tides along the coast from the center northeastward to southwestern Louisiana.

This storm passed over the Windward Islands near Santa Lucia on August 21, attended by heavy squalls but with no indications of organized circulation. Moving rapidly westward through the central Caribbean Sea, the wave formation passed south of Jamaica during the night of the 24th, where its progress became slower and the first indications of development were noted. It passed

north of Swan Island as a moderate storm but with definite indications of rapidly increasing intensity, and crossed the tip of Yucatan Peninsula during the night of August 27, attended by full hurricane winds. Passing into the Gulf of Mexico, and moving northwestward in an almost straight line it reached the Texas coast, approximately two days later, as a severe storm attended by full hurricane winds over a path nearly 150 miles in width. Tides were extremely high near the path of the center and high tides extended well to the right of the center. The highest reported was 14.7 feet at Matagorda, Tex.

feet at Matagorda, Tex.

A disturbance developed over the extreme southeast Bahamas, turned southwestward, and, increasing to hurricane or near hurricane force, crossed the north coast of Cuba a short distance southeast of Cay Paredon Grande where on the 6th, a wind of 70 miles per hour was reported. The disturbance weakened somewhat as it crossed the mountainous region of Cuba, but still retained an active cyclonic circulation as it passed into the Caribbean. Moving southwestward it regained hurricane intensity and, on approaching the Yucatan Peninsula, turned westward and struck inland over British Honduras. The center emerged into the Bay of Campeche on the 9th. On the 10th its northwest movement was blocked by high pressure at the surface and aloft and, being forced back southeastward, it reentered Yucatan and dissipated on the 11th in the interior of the peninsula.

North of Belize severe damage was reported from a coastal area 100 miles long and 40 to 50 miles deep. The center passed inland near or over the small village of San Pedro which was 90 per cent destroyed. From Caye Corker came a report that a tidal wave had cut the island into three distinct parts, carrying away everything in its path. Damage throughout the affected area of British Honduras has been estimated at \$4,000,000.

ICC. See Interstate Commerce Commission.

ICELAND. An island state in the North Atlantic, situated 200 miles east of Greenland and about 540 miles northwest of Scotland; occupied by Anglo-American forces since May 10, 1940, for the duration of World War II. Area, 39,709 square miles, only one-fourth of which is habitable. Population in 1941, 121,618 (excluding Anglo-American forces). Populations of the chief towns: Reykjavik (capital), 39,739; Akureyri, 5,357; Hafnarfjördur, 3,718; Vestmannaeyjar, 3,410. Elementary education is compulsory and there is virtually no illiteracy. Reykjavik has a university. Over 98 per cent of the people are members of the Evangelical Lutheran Church.

Production. Fishing is the chief industry; it supports nearly 30 per cent of the population directly and in 1942 it provided 96 per cent of the value of all exports. The fish catch totaled 335,157 metric tons in 1942, of which 88 per cent was exported to Great Britain. At the beginning of 1943, the fishing fleet consisted of 607 vessels totaling 26,627 gross tons, including 31 steam trawlers totaling 10,435 gross tons. About 36 per cent of the inhabitants live by agriculture, sheep raising, and dairy farming. Potatoes, turnips, and hay are the chief crops. There were 627,966 sheep and 39,867 cattle in 1940. There are few trees and only low-grade

coal deposits, but extensive peat deposits are used for fuel and many buildings in Reykjavik are heated by water from hot springs. Only about 25,000 horsepower of the 4,000,000 available from water power is utilized. The chief manufactures include fish, dairy, and other food products, foundry articles, leather, beverages, clothing, shoes, gloves, ship's equipment and stores, paint, furniture, etc.

Foreign Trade. Merchandise imports in 1942 were valued at 247,080,000 Icelandic crowns (129,577,000 in 1941); exports, 200,436,000 crowns (188,508,000 in 1941). The chief exports are fish, codliver oil, mutton, wool, sheepskins, horses, furs, and eider down. For the distribution of trade in

1941, see 1943 YEAR BOOK.

Finance. Budget estimates for 1942 placed revenue at 34,000,000 crowns and expenditure at 29,000,000 (18,478,173 and 18,016,263 crowns, respectively, in 1941). The national debt was 51,201,000 crowns on Dec. 31, 1941 (55,330,000 on Dec. 31, 1940). Official exchange rate of the crown (krona) in 1941 and 1942, 6.505 crowns equal 1 U.S. dollar, or 1 crown equals \$0.1537.

Transportation. There are no railways. In 1943 there were about 3,000 miles of highways. A fleet of small Icelandic merchant vessels provides shipping services to the United States and Great Britain. Coastal shipping and a local air line help to maintain communication between Iceland's chief towns. There are nearly 10,000 miles of telephone and telegraph lines and overseas communication by means of wireless telephone and submarine cables.

Government. The Constitution of May 18, 1920 (amended in 1934 and 1941) provided for a constitutional monarchy. The King of Denmark exercised executive power through a responsible Cabinet. Legislative power rests conjointly with the King and the Althing, the oldest parliament in the world, established 930 a.d. The Althing in 1943 consisted of 52 elected members. One-third of its members are elected to the upper chamber by the whole Althing; the other two-thirds form

the lower chamber.

Iceland was acknowledged by the Act of Union of Nov. 30, 1918, to be an independent, sovereign state having a personal union with Denmark through a common king. This treaty expired in 1943. In 1938 the Althing voted to terminate the union with Denmark upon expiration of the treaty and a popular referendum was to have been held on this issue during 1940. This program was interrupted by the German occupation of Denmark on Apr. 9, 1940. On April 10 the Althing authorized the Government temporarily to exercise the sovereign powers vested in King Christian X and to assume full charge of Iceland's foreign affairs, previously conducted by Denmark under the Act of Union. The Althing on May 16, 1941, adopted constitutional amendments (1) proclaiming Iceland's right to declare itself independent, (2) terminating the Act of Union upon its expiration in 1943, (3) providing for the election of a regent to exercise the King's functions temporarily, and (4) providing for the establishment of a constitutional republic as soon as union with Denmark was formally terminated. Sveinn Bjornsson, former Icelandic Minister to Denmark, was elected regent on June 17, 1941, for one year. He was reelected in 1942 and 1943.

British troops occupied Iceland May 10, 1940, "to insure the security of Iceland against a German invasion" (see 1941 Year Book, p. 344). On invitation of the Iceland Government, and with the approval of the British, the U.S. Government on

July 1, 1941, assumed responsibility for the military protection of Iceland for the duration of the war (see 1942 YEAR BOOK, p. 269 f.). British troops were all withdrawn during 1942. For 1943

developments, see below.

History. The Government during 1943 continued its efforts, which were only partially successful, to control the inflationary rise of wages and living costs caused by the presence of American forces, extensive work on new military, naval, and air installations, and other war conditions. Hundreds of Icelanders were working on U.S. Army projects. The fishing industry was booming as a result of the assured market in Britain provided by the U.S.-Icelandic lend-lease agreement of 1942. In December the United Press reported that there was not a single unemployed person in Reykjavik. A three-year trade agreement between Iceland and the United States was signed August 27 which was expected to facilitate an expansion of mutual commerce.

Long-range German planes made sporadic attacks upon towns and bases in Iceland and shipping in the adjoining waters during the year. On June 20 the Iceland Foreign Office protested a German attack on a native coastal vessel that killed two persons and wounded five. A four-engined German bomber was shot down off the north coast of Iceland by U.S. fighter pilots on August 5. Lieut. Gen. Frank M. Andrews, commander of all U.S. forces in the European theater of operations, and Bishop Adna Wright Leonard of the U.S. Methodist Church were killed with other occupants of their plane in a crash in Iceland on May 3. Appointment of the first Russian Ambassador to Iceland was announced in Moscow December 12.

# ICE SHOWS. See SKATING.

IDAHO. A mountain State. Area: 83,557 sq. mi. Population: 524,873 (1940 census); 467,657

(1943 nonmilitary estimate).

Statistics. Statistical information pertaining to each of the 48 States and the District of Columbia has been assembled in comparative tables which appear in the following articles. Agriculture; Mineral Production; Roads and Streets; Schools; Social Security Board; Taxation; Universities; and Vital Statistics. The census of manufactures has been suspended for the time being; for the latest information, see 1941 YEAR Воок, р. 430.

Elections. See the article Elections in the United States; also, for incumbents, House of Representatives and Senate.

Legislation. See the separate article on STATE

LEGISLATION.

Officers. The Governor is C. A. Bottolfsen (Rep.), inaugurated in January, 1943, for his second two-year term; Lieutenant Governor, Edwin Nelson; Secretary of State, George H. Curtis; Attorney General, Bert H. Miller. See Antimony; Dams; LEAD; SILVER; TUNGSTEN.

ILLINOIS. An east north central State. Area: 56,400 sq. mi. Population: 7,897,241 (1940 census);

7,643,350 (1943 nonmilitary estimate).

ILLUMINATION. The only new types of lamps that were permitted to be manufactured during the year under WPB limitations were those developed for special military uses, and these cannot be discussed now. The all-glass sealed-beam automobile head-light lamp, which was developed prior to the war and which immediately found almost universal use on the American motor-car, has found enormously wide military applications. More than 30 types and styles of this very effective lamp have been developed for tanks and ordnance vehicles, signaling, spotlights and searchlights, airplane landing lights, and a variety of other critical uses where their simplicity of installation, minimum use of critical materials, precise optical control, and standard of candlepower maintenance were important and valuable factors.

The subject of miniature lamps ordinarily conjures thoughts of Christmas-tree or flashlight lamps, or perhaps an automobile tail-light. Currently, however, several types of miniature lamps unfamiliar to the public are in military service. Signaling devices, radios, telephones, and indicating devices of the U.S. Army Signal Corps require a hundred different designs. Sixty-eight different types are used on Navy vessels, and still others on the myriad airplanes of the U.S. Army Air Forces. Doctors and surgeons of the Medical Corps depend upon a group of highly specialized miniature lamps, many of them of the tiny "grain of wheat" size and variety that was one of the interesting novelties at the 1939–40 World's Fair.

Requirements of gunnery training devices, and visual education through the medium of motion pictures and training films, required a manufacturing output of motion picture projection lamps three times that of the previous peacetime high level of yearly production. The needs of high-speed pho-tography were factors in the development of new types of flash-lamps and flash-tubes, some of which are capable of giving repeated intense flashes of one-millionth second duration. (See PHOTOGRAPHY.) Special lighting devices are typified by those developed for the inspection of gun bores, shell cases, and optical flats. In the normal commercial range of incandescent and fluorescent lamps, the enormous demand of America's 24-hour-a-day wartime industry kept all available production facilities busy, and brought some restrictions and standardizations in the sizes and varieties available to normal civilian customers.

Some new lines of incandescent searchlights were developed for various uses ranging from pilot-house mounting on shipboard to signaling use, for which purpose they were fitted with a Venetian-blind type of shutter. In output, these range up to ten million beam candlepower. A high intensity mercury-arc air-cooled searchlight, utilizing a 900-watt aircooled high-pressure mercury lamp, and giving four

times the beam candlepower output of a comparably sized incandescent unit, was developed, principally for military uses. The counterpart of this searchlight, however, is used in connection with the U.S. Weather Bureau, designed to facilitate day or night determination of cloud ceilings and the rate at which they are lifting or lowering. The projector sends a narrow beam of light in a true vertical direction, and an associated "ceilometer" detects the returned light reflected from the cloud, indicating the angle from the vertical. The height of the cloud then is determined by simple triangulation.
